

#### Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

#### Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + Manténgase siempre dentro de la legalidad Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

#### Acerca de la Búsqueda de libros de Google

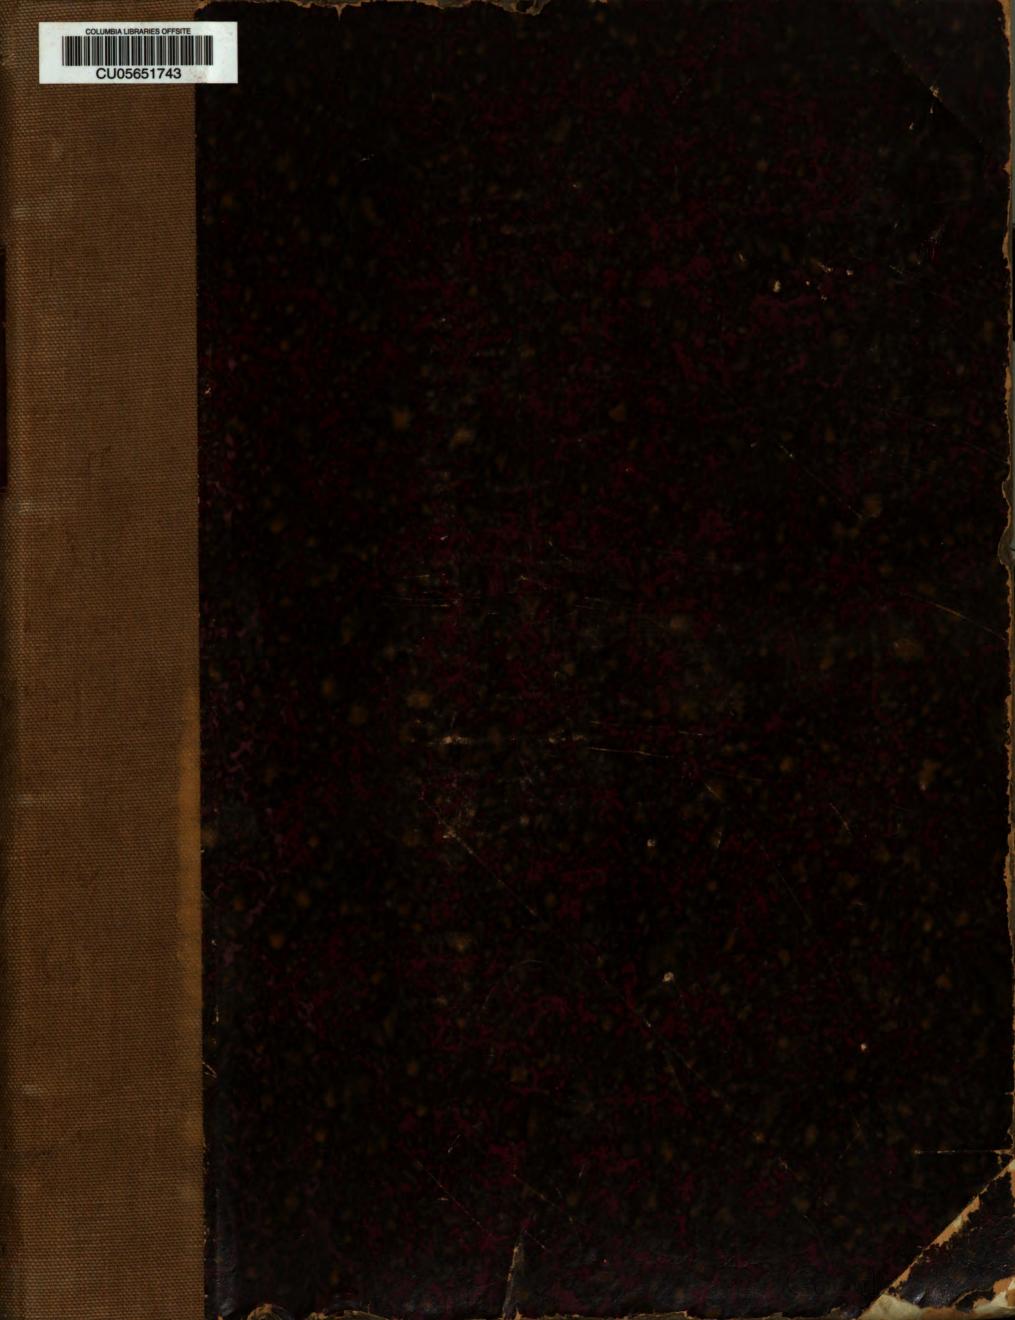

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página http://books.google.com

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

### EDITORIAL NOTES.

A Slight Concession on the Part of the New York Telephone Company. On January 1, the New York Telephone Company reduced its rates for service in this city on party lines. The

rates now in force range from \$60 a year for 600 local messages to \$135 a year for 1,800 messages. At first glance \$5 a month would appear extremely reasonable for telephone service but when it is recalled that this rate entitles the subscriber to but 600 calls a year, or less than two calls a day, to say nothing of the fact that another instrument is connected to the same wire and which may prevent the use of the telephone when most needed, the new minimum rate strikes one far from favorably.

Even with 1,800 messages for \$135 a subscriber would be paying over 7 cents a call for a decidedly limited and hampered service owing to the party line arrangement. Let the local lessee of the Bell monopoly reduce its rates to say 5 cents a call and do away with party lines, and although it might not be able to pay the munificent dividends in the future that it has in the past, the company would by no means go into the hands of a receiver and the public of New York City would be enjoying telephone service at somewhere near the same rates that are in force in other large communities.

Steel-Framed Buildings and Electrolysis.

PAGE.

Is electrolysis endangering the foundations of steel and iron-framed buildings in Cleveland, Ohio? This is a ques-

tion that has been causing some discussion of late in that city.

About a year and a half ago this same question was brought up in relation to the high buildings in Chicago, resulting in an unofficial investigation being made. This examination is said to have shown that although stray electric currents were at work at the foundations of some of the structures, the rate at which electrolytic action was going on was so slow that no drastic measures were deemed necessary.

In the case of Cleveland, although this important question has been discussed theoretically by architects, engineers and electricians, no definite conclusion has been arrived at, owing, we presume, to no electrical survey having been made. One well known architect

discussing the matter recently is reported as saying :

"I have been unable to find in any buildings any effect from electrolysis. There are several things which would prevent this. The first is that in all of the large buildings the insurance Underwriters demand the most thorough kind of insulating on all electric wires, and a careful examination is made before they are covered. This prevents the electric currents from getting into the structural work.

"If in some way a wire should become bare and form a short circuit, the point of the wire at which it touched the beam would be so much smaller than the beam itself that there is good reason to believe that the wire would be consumed long before the beam or truss would be affected to any great extent. It might be possible, although I have never heard of a case, for the pipes in a building where there is a large amount of electricity, to be affected by electrolysis, but as far as I can learn there has been no effect discovered in the steel structural building.

"At one time, when the electric plants were first introduced into the boats of our navy, there was considerable talk that the steel hulls would be effected by electrolysis. Here there was no way for the current to pass out except through the hull. The Government appointed a commission to investigate this matter, and the investigation set the thing aside. If it does not affect the vessels it is hardly probable that its effects will be felt in the modern buildings.' That the hulls of steel vessels are not affected by electrolytic action in the same way that buried water pipes are is no sign that the foundations of steel buildings would not deteriorate through the action of stray currents, owing to the very different conditions existing. In the case of a vessel the area of contact between the hull and grounding medium or the salt water is so great as to cause practically no resistance to the passage of a current, whereas in high metal structures the grounding medium is cement, which, owing to the presence of unslaked lime, is neitl er a good conductor of an electric current or a perfect insulator.

In Chicago electrolytic action was attributed in part to stray trolley currents, which it was claimed passed from the clay soil to the steel beams or rails in the foundation piers, and thence to the supporting columns of the buildings. In cities such as Chicago and Cleveland, where the overhead trolley is extensively made

use of, stray currents might possibly affect the foundations of steel-framed buildings in the way mentioned, but in New York City little danger need be apprehended by property owners on this score, as the electrical surveys that have been made from time to time in the Borough of Manhattan have shown conclusively that there are but two or three spots on the whole of the Island where stray trolley currents exist.

In order, however, to settle once for all this much debated question, as to whether electrolytic action is affecting the supporting columns of high steel structures in the various cities, it might be well were a careful electrical survey made by some competent engineer, and we think the results obtained would warrant the trouble and expense.

# Electricity vs. the Gasoline Motor for Automobiles

Several years ago when automobiles were a novelty a discussion arose as to what form of motive power was best adapted to the propul-

sion of this type of vehicle. The advocates of the mineral spirit motor claimed that it was much more reliable than any other form of power and pointed with pride to the many successful trials made with it in France, while the adherents of electricity defended the storage battery with equal tenacity.

This question, which has been discussed almost as much as the relative advantages of the direct and alternating current, was again brought up at a recent meeting of the Franklin Institute in Philadelphia. There were present several well-known experts who defended or pointed out the numerous advantages of the vehicle propelling power in which they were interested. One speaker prophesied that the future automobile would be a cheap and light electric vehicle. He admitted that the batteries were heavy and required strong construction in the carriage; also that the cost of pneumatic tires and their maintenance was a serious consideration, but he claimed that these difficulties were gradually being surmounted; that lighter batteries would make their appearance and that the tire question would be solved.

Another well-known inventor expressed the belief that the present experience in the practical use of automobiles had shown that the electrical vehicle had a limited field of usefulness. In his opinion the weight of the batteries could never be reduced to any great extent and still retain their efficiency. He predicted that within the next ten years gasoline motors would be used on heavy express and freight wagons and that 80 per cent. of all the self-propelled vehicles would be run by gasoline. During the discussion it was pointed out that electrical automobiles have been practically abandoned in France and that mineral spirit motor-driven carriages have become so popular that many are used by families for touring purposes and are enabled to travel at the rate of 100 miles a day. On the other hand, it was conceded that the great objection to gasoline motors is the offensive smell, which, as is well known, cannot be entirely gotten rid of even by employing a carburetor. It might also be added that another serious objection to this type of vehicle is the constant vibration which makes itself felt even when the carriage is at

Discussion on the relative advantages of electricity and gasoline as an automobile mo-

tive power will probably go on for years to come. That each type has its advantages and defects goes without saying, and the ultimate result of unlimited argument on the subject will, as in the case of the discussion on alternating versus direct current, simply go to show that each form of motive power has its own especial sphere of usefulness to which it is far better adapted than any other. Thus the future should see electrically operated automobiles plying in city streets, while mineral spirit motor carriages will undoubtedly be made use of principally by pleasure parties for long country runs.

#### Heating and Cooking by Electricity.

Referring to the use of electricity in the household for cooking and heating purposes, we stated in these columns some time

ago that in New York City there was a slow, but constantly increasing demand for current for the purposes mentioned, in spite of the fact that its use entailed a greater expense than were gas employed.

In two recent issues of the London Electrical Review this question is quite thoroughly dealt with in a continued article entitled "The Position of the Electrical Heating Industry in this Country." Although conditions differ in Great Britain from those in this country, there is much in the article referred to that should be of interest to the electrical industry on this side of the Atlantic. In one of the opening paragraphs the writer says: "One reason for the slow introduction of this class of apparatus into everyday use has undoubtedly been the fact that, until comparatively recently, both the electrical supply authorities and the wiring contractors have not considered it desirable to push the matter. They have looked upon any kind of heating by electricity as expensive, and likely to bring them trouble. and without going much further into the matter, have condemned it as such."

As will readily be remarked this same hesitancy and lack of faith is what has, to a great extent, prevented a more extensive use of the electric current for heating and cooking in this country. As our contemporary aptly points out, however, in comparing electricity with gas or coal there are other points that should be taken into consideration besides the comparative cost of the fuels. Heating and cooking by electricity is far more cleanly than any other method, requires a minimum amount of attention, and last but not least, if the installation is properly designed the heat may be applied just where it is wanted and for the length of time desired. These advantages are certainly worth a monetary consideration, which should be taken into account when comparing the use of the electric current with other methods of heating.

That electricity should be more quickly adopted in England than in this country and especially in New York City for heating and cooking is indisputable, owing to the fact that current is usually supplied in Great Britain at a lower price per unit than here. For instance, the article says:

"With current available at 1d. or 1½d, per unit, the cost of heating one's house or cooking one's meals throughout will not be excessive, provided some other means is adopted for heating the large quantities of water usually required for domestic purposes, such as for washing up, supplying baths, etc., which cannot easily be dealt with electrically."

Now with gas at, say, 80 cents a thousand feet, electric current at 3 cents a kilowatt hour, would just about hold its own in the heating and cooking line, but, unfortunately, no such low rate exists for electric current in this city. The rates now in force are ten cents a kilowatt for the first three hours of daily use and five cents a kilowatt for all use in excess of that time, and it is these high rates that have, to a great extent, prevented the adoption of electricity for heating and cooking in New York.

Were the central station people so disposed they could undoubtedly do much toward encouraging the universal use of electrical heating and cooking by selling current for these purposes at a little more than the bare cost, but unfortunately they do not seem disposed so to do in spite of the fact that such a step should ultimately redound to their advantage, at least to a certain extent, by solving the troublesome problem of a day load.

#### UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

THE new incandescent electric lamp invented by Dr. Welsbach will, it is said, shortly be introduced into England.

WE are in receipt of the 21st annual number of *The Tradesmaa*. This issue is extremely voluminous, containing as it does some 235 pages of matter. Among other interesting and timely articles by authoritative writers is to be found one on the Electrical Development of the South, which embraces an account of the new sewerage system at New Orleans. This article, which is illustrated, contains much information of interest and is well worthy a careful perusal.

At the Eighth Annual Convention of the Northwestern Electrical Association, which will be held in Milwaukee, Wis., on January 17, the following papers will be read: "Modern Development in A. C. Series Arc Lamps," by R. Fleming, Lynn, Mass.; "Alternating Cu rent Phenomena," by Prof. Jackson, Wisconsin University; "Combination of Electric Lighting and Hot Water Heating Plants." by W. H. Schott, Chicago; "Central Station Economies," by H. W. Frund, Vincennes, Ind.: "Induction and Direct Current Motors," by Ralph D. Mershon, New York City; "Relative Desirability and Efficiency of Various Types of Engines on Central Station Loads," by Prof. Richter. Wisconsin University; "A Life Test of Incandescent Lamps," by Prof. Shepardson. Minnesota University; "A Canadian Plant," by L. G. Van Ness, Quebec. Canada.

A system of night signaling by means of flags held aloft by kites and illuminated by a suspended searchlight, on which Mr. William A. Eddy has been experimenting for some time, was given a practical trial last Saturday night at Bayonne, N. J. The searchlight was of about one hundred candle power and was suspended within a few feet of the flags. The light, which weighed three pounds when loaded with carbide and water, was sent up at a quarter to seven o'clock, suspended two feet below the flags, each of which was two feet square. Both light and flags were supported by one nine-foot and two seven-foot kites. The flags were fastened to the kite cable by perpendicular staffs. To brightly light the flags the searchlight was rigidly braced on the kite

cable in such a position that it pointed straight skyward. As the kites carried the cable upward the glare of the fiery pencil passed beneath the flying kites and upward into space. The rapid fluttering of the flags caused the effect of a stream of blue, white and red fire extending ten or twelve feet beyond the searchlight reflector. It was a prismatic effect, with the red bar of the spectrum furthest away. As a means of war signaling at night the experiment shows that a great variety of color and light effects can be produced and seen from a great distance. The spectacular effect was impressive, and Mr. Eddy believes that, aside from war signaling, this singular and new night aerial effect would excite wonder at the Paris Exposition and at night carnivals.

A CABLE dispatch to the N. Y. Herald states that the South Eastern Railway Company of England has made arrangements with the Wireless Telegraph Company for the Marconi system, to be used in the course of a few weeks on the company's royal mail steamers between Dover and Calais, and also on the mail steamers between Folkestone and Boulogne. This innovation is of great importance to the safety of the public traveling by the short sea routes, as when in mid-channel—say, half an hour from either the French or English shore—the ships will have telegraphic communication with either shore.

In discussing the question of submarine boat construction in its present aspects, a writer in the Marine Review remarks that, notwithstanding the indifference so generally manifested in England regarding such craft of every description, France has been the one European nation that has steadily endeavored to realize its development to the most perfect degree, despite the numerous failures which have taken place. These failures have, of course, produced much discouragement. It was not so very long ago that public gratification was at a high pitch over the Gustave Zédé, but it appeared later that the range of action of the vessel was limited in the extreme: the French authorities derived no little satisfaction, however, out of the fact that the Zédé had at least demonstrated the practicability of the submarine boat. Attention was next turned to the Goubet boat. and, after it had proved thoroughly impracticable, interest centered as generally in the Morse, but, as it is well known, with similar disappointing results.

The Speaker of the New York Assembly has selected Mr. Witter, of Tioga, as chairman of the Electricity Committee.

THE Third Avenue Railroad of New York has some of its cars equipped with a new life-saving fender. It is arranged to fold up compactly when not in use, and is fitted with a bracket on each side, which prevents objects caught in it from falling out. On a level road it does not run more than an inch above the track.

The automobile stage made its first appearance on Fifth Avenue of this city on January 2. It was a private trip of the officials of the Stage company and their guests, but so eager was the public to welcome the new vehicle that the driver was hailed in vain at street corners by many persons who wanted to ride. The vehicle accommodates eight persons comfortably inside, and has seats outside for four others and the driver. It is upholstered in brown

leather and is much more comfortable than the old stages. It has wooden wheels, with three-inch solid rubber tires. There are electric lights inside, and passengers may signal the driver to stop by pressing a button. Storage batteries concealed under seats furnish the power, which is sufficient to cover twenty-five miles on level roads without recharging. The omnibus has a speed of nine miles an hour. The total weight of the vehicle is 5,500 pounds. It took the automobile 'bus just one hour and seven minutes to make the trip from Eighty-eighth street to Washington Square and back, whereas with the stages now in use the run usually takes one hour and fifty minutes.

WE learn from our New Orleans exchanges that the score of magnificent floats which will compose the already much talked-about electric parade of Nereus in the Carnival of 1900 are now practically completed and the success of the undertaking is a foregone conclusion. All the multiplied and intricate mechanical and electrical problems which presented themselves in the course of the work have been met and overcome. There is no possibility that some unforeseen hitch will do naught to obscure the splendor of Nereus' arrival.

An Associated Press dispatch from Baltimore is authority for the statement that "Dr. Henry A. Rowland, professor of physics at Johns Hopkins University, seems to have discovered the cause of the magnetism of the earth. He has been experimenting for about a year, using a wheel wound with miles of fine wire and revolving on a shaft run by a motor. About the wheel is a casting or sheath of brass, with an air or ether space between it and the circumference. The whole represents the earth with its atmosphere. By revolving the wheel magnetism is produced in the wire. Dr. Rowland is now working to show that the faster the revolution the more the magnetism. He believes that the earth and heavenly bodies produce the magnetism in same way."

A London contemporary states that Mr. Kennedy, who went to the Transvaal as the representative of the Wireless Telegraph Company, has arrived at Modder River. He is said to have made most successful experiments in the transmission of wireless messages between Orange River and De Aar, a distance of seventy miles

ONE of the latest uses of electricity is its application as a headlight in the canes of gentlemen who for one reason or another find themselves out late at night. The new "pathfinder," as the electric cane has been called does not differ in appearance from the ordinary walking stick. In the head of the "pathfinder," however, is fixed a small but powerful electric light covered by a shield which can be instantly released by a pressure of a button near the head. Behind the light is a strong reflector, so that the light in action is really a miniature searchlight. It is anticipated that the "pathfinder," will be popular with men whose business or other engagements make it necessary for them to go home late at night.

The calcium carbide manufacture in Sweden is rapidly increasing. Not only is the Trollhättan factory, which for some time was the only one in Sweden, being extended, but, according to Engin-ering, London, new works have been erected at Alby. Mansboand Brattfors, the first of which has already commenced operations.

This will bring the annual production up from 1,000 to 6,000 tons. As the home consumption in Sweden was only about 100 tons last year the bulk of the calcium carbide is intended for export, although no doubt the requirements of Sweden herself are likely to increase materially.

A French physicist states that from the experiments he has made he has ascertained that selenium is not acted on by Hertzian waves in the atmosphere as it is by light, in that even in the presence of these waves its electric resistance is unaltered.

The average life of first-class leather belting. running indoors and under ordinary conditions, is ten years, says the N. Y. Sun. Belts subjected to acid fumes would last a much shorter time than that; and on the other hand in especially favoring circumstances a belt might last much longer. There was taken down in New York not long ago a leather belt that had been running twenty four years; this, however, was something unusual. As is the case with pretty much everything that is made and sold, leather belting may be bought second-hand, the second-hand belts coming into the market naturally enough through the refitting of factories, through the substitution of belts of one width for those of another, and so on. Secondhand belts that have not been much used sell for not very much less than new belts; their price decreases, of course, according to the wear to which they have been subjected. When a leather belt ceases to be useful as a belt it is likely to be sold to be cut up into boot heels what there is left of it after that going to the scrap heap.

## LIEUT. S. DANA GREENE AND WIFE DROWNED.

## They Were Skating on the Mohawk River Near Schenectady.

On Monday afternoon last while skating on the Mohawk River near Schenectady, N. Y., Lieutenant S. Dana Greene and his wife, a daughter of the late Rear Admiral Chandler, U. S. N., lost their lives. Ice had been removed from a section of the river and not being aware of the fact the unfortunate couple skated on to the thin ice, broke through and were drowned before help could arrive.

Both Mr. Greene and Mrs. Greene were extremely popular and their untimely death has cast a deep gloom over the city of Schenectady. Mr. Greene was well known to the electrical fraternity, and had been connected with the General Electric Company for a considerable length of time. He was the son of the late Commodore S. Dana Greene, who succeeded to the command of the Monitor after Admiral Worden was disabled in the famous fight with the Merrimac during the Civil War.

Lieutenant Greene was educated at the Naval Academy of Annapolis, but after a short period of duty at sea he resigned and became interested in electrical undertakings. When the war with Spain broke out Lieutenant Greene volunteered his services, and was made executive officer of the auxiliary cruiser Yankee. Mr. Greene was an active member of the Institute of Electrical Engineers, and has from time to time contributed valuable papers to its proceedings.

The untimely and sudden death of Mr. and Mrs. Greene will be deeply deplored by all who were fortunate enough to be honored with their acquaintance

#### THE FUTURE OF ELECTRIC ILLU-MINATION.

BY JEAN WETMORE.

#### PART H.

The war between electricity and gas is much like that between armor plate and guns.

Up to the present time electricity has had the lead, but the late improvements in Welsbach and other burners make the strife more interesting and more evenly balanced.

It is better at this time that electricians have a discussion of the vulnerable features of their systems of illumination and recognize the strong points of their adversaries, that they may make improvements, than to place too much confidence in past successes and ignore the strong points and the recent successes of the gas people.

The object of this article is thus briefly stated

To carry the lighting agent to the lamps we must have conductors of high priced copper and great conductivity: a No. 14 wire is the smallest size allowed by the Underwriters, with a possible exception for lamp cords and electroller wire: while for interior work the conductors must be rubber covered and the copper must be tinned to prevent the vulcanized rubber from corroding the wire; then the insulation must be braided or cloth tapped to preserve the rubber from injury by abrasion: then this tinned copper, rubber insulated and braided conductor must be drawn through a conduit of tar-soaked paper or other suitable material, and this tube must likewise be protected by an armor, usually an iron tube, to keep the lime from eating the paper, the water from making pulp of it, and destroying the insulation and the sulphurous acid from lessening the conductivity of the wire by corrosion.

This is almost as bad as the benighted Oriental's idea of cosmogony, of the world resting on the back of an elephant, the elephant standing on the back of a turtle, and so on ad infinitum.

Compare all this electrical clap-trap with a plain iron pipe for gas, which for simplicity is unexcelled,

We can not allow of there being a conspiracy between the electrical supply and the manufacturing people, to enrich themselves by increasing the cost of electric installations, by trading on the gullibility of the friends of electrical illumination, for by so doing they would readily perceive that they would finally kill the electrical goose that lays the golden dollars.

It is interesting at this point to review the causes leading up to this complicated and expensive state of affairs.

Briefly stated, the principal cause has been due to a lack of common sense, foresight, and also the incompetency on the part of the electric staff of the various boards of Fire Underwriters.

For a full tenth of a century the writer unceasingly contested for high grades of durable insulation and simplicity of construction, but those in high authority were not willing to let good enough alone, and business houses of high reputation have relegated themselves to mediocrity, and the battle was lost.

Fifteen years ago there were rubber insulations on the market that could be safely buried in concrete or plastered in as permanent fixtures of a building; those insulations would

stand water, lime, acids, alkalies, rough usage, heat and cold, and some of our older buildings after fifteen years will show these insulated wires in as good a practical condition as when first installed; but we have no such grade of rubber insulation being installed to-day, and for this reason there are no old rubber boots and shoes lying around.

Good quality and durability in insulation have commercially been sacrificed in general practice to shoddy and cheapness.

Reliable manufacturers traded on the reputation of their products, and deceived their customers for temporary gains, that they might kite stocks, form combinations and by sharp practice skin the confiding foreign investors; thus the result well exemplified in Abraham Lincoln's well known saying, "You may fool all of the people part of the time and part of the people all of the time, but you can't fool all of the people all of the time."

Again the Underwriters have not encouraged the best products or the improvements in the same. They have ever taken the ground of strict impartiality, recognizing no differences, and they made their rules and requirements to guard their own interests against the failings of the worst class of material, and for this reason mainly we are unable to-day in common practice to find a rubber insulation being installed that will resume its original contour when firmly compressed, or will stand reasonable torsion, without breaking, even when fresh from the shop.

The Underwriters demand a certain thickness of material regardless of quality, with a result that our rubber for insulation purposes much resembles a good quality of tenacious baked mud.

(To be continued.)

## ELECTRICITY SUPPLY FROM CENTRAL STATIONS.

Covering Recent Developments in the Construction and Operation of Stations in New York.

[The following is a summary of the address delivered by Mr. J. W. Lieb, Jr., before the New York Electrical Society, Dec. 21, 1899.]

The speaker opened his remarks by a reference to the extent and character of the territory included within the limits of Manhattan Island, pointing out that this field presents nearly all of the varying conditions of electricity supply, covering many of the problems connected with the generation and distribution of electricity for lighting and power purposes.

After a brief review of the history of the electric lighting industry previous to the starting of the old Pearl street station of the Edison Company, an interesting picture was presented of that pioneer lighting station, including reminiscences of the early difficulties encountered in the construction and operation of the station machinery and how they were successfully overcome. Some interesting maps were shown, including maps of the original underground system, diagrams illustrating a house-to-house canvass made by Mr. Edison. showing all the gas light and power users in the district, and a map on which future distributing stations are laid out, covering all the territory up to Central Park, within which thirty-eight distributing centers were located.

Series of curves were presented, showing the development of the business of the New York Edison Company from '83 to date, including

curves of income, load, connected installations, etc.

The loads carried by the several stations connected to the system were shown by varicolored curves, and explanations were given of the character of the business in each district as reflected in the peculiarities in the forms of the curves. Parallel curves, exhibiting the variations from month to month and from year to year, formed a graphic indication of the effect of the season and the variations in the hours of the rising and setting of the sun

A sectional plan was shown of the waterside station now being constructed between 38th and 39th streets and the East River, by the New York Gas and Electric Light, Heat & Power Company.

The equipment of this station, covering a plot 190 x 273 ft., was described in detail and data was given of the efficiency which it is expected to obtain from the engines, generators, etc. The complete plant will consist of sixteen three-crank compound condensing engines, 75 revolutions per minute, and developing each 5,200 indicated horse-power at most economical cut-off, and nearly 10,000 hp. at maximum power. Each engine will be direct connected to a three-phase generator operating at 6,600 volts and rated at 3,500 kilowatts, but capable of operating with a load of 4,500 kilowatts for three hours.

Fifty-six boilers, each of 6,400 square feet of heating surface, will furnish the steam supply and it is proposed to equip the boilers with super heaters in addition to the usual complement of automatic stokers, feed water heaters, feed pumps, etc. The products of combustion will be discharged into four steel stacks, each 19 ft. in diameter and 196 ft. high above the grates, supplemented, when necessary, by forced draught from fan blowers.

A map of the extensive underground system supplied with current from the Edison Company and by the companies associated with it, under the administration of the New York Gas and Electric Light, Heat & Power Company, was shown, for which the water-side station is to furnish the main current supply.

A number of rotary converter stations now in course of construction at Horatio street, West 84th street, East 121st street, and West 124th street will be equipped with rotary converters and storage batteries, permitting of an extension of the direct current underground system into new and hitherto unoccupied territory, and, together with rotary converter equipments at several of the present generating stations, will afford at once a considerable outlet for the high tension three-phase current generated at the water-side station, enabling also some of the less economical generating apparatus to be put out of commission and to be used during only a few months of the year on the peak of the load. The speaker then briefly touched on some details in the method of distribution in future of series are lighting, rectifiers, etc., which the lateness of the hour made it impossible to consider at length.

#### Another Cable to South Africa.

The Western Union Telegraph Company reports that the cable recently completed from Cape Town to St. Helena has been extended to Ascension Isand. It is expected that the cable will be extended north forming another route to South Africa. The line is expected to be completed about the end of the coming March.

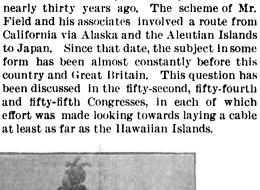

## NOTES ON THE FORMATION OF COPPER "TREES" AND "NODULES."\*

BY SHERARD COWPER-COLES.

Everyone who has electro-deposited copper, either on a laboratory or commercial scale, must have experienced great difficulty in preventing the formation of copper "trees" and "nodules," and must have noticed the different formation obtained under apparently the same conditions. No systematic work appears to have been done to determine under what conditions copper "trees" most rapidly grow, or what conditions vary their formation. Mr. J. W. Swan found that regularity and smoothness of deposit was almost entirely dependent

posited was of a good salmon color and crystalline. In all cases the cathodes were placed on edge to the anodes, there being a space of from ½ in. to 2 in. between them, the anodes being of sheet copper The potential difference between the terminals of each cell was from 2.4 to 2.8 volts. The solution employed contained 25 oz. of copper sulphate to the gallon of water, to which was added various percentages of free acid.

A fine "nodule" was obtained from a solution of copper sulphate containing about 30 oz. to the gallon of, water and 12 oz. of free sulphuric acid, the current density being 15 amperes per square foot of cathode surface, the cathode being revolved at about 17 revolutions

AN AMERICAN PACIFIC CABLE.

BY GEORGE OWEN SOUIER.

trans-Pacific submarine cable was first discus-

sed and considered by the late Cyrus W. Field,

It is interesting to note that the idea of a

on the absence of solid particles held in suspension in the electrolyte, and that excrescences could be entirely avoided by taking care that the electrolyte was free from solid floating particles. He observed that at the seat of each nodule was a speck of some foreign substance.

Dr. Gore has given the matter some thought, and has observed that the greatest length of "nodule" is in the direction of the greatest intensity of current and amount of copper in

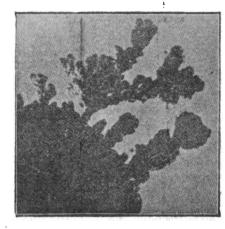

Fig. 2.—Copper Trees. Solution containing free H<sub>2</sub>SO<sub>4</sub>—6 oz. to the gallon.

per minute, the diameter of the disk being 30 in., the "nodule" was removed from the edge of the disk. Fig. 4 illustrates a "tree" obtained under similar conditions. Fig. 5 shows the apex of a copper cone deposited from the same solution, the cathode making about 10 revolutions per minute. Fig. 6 shows a copper cone deposited under the same conditions, making about 32 revolutions per minute. In the one case the surface is covered with a mass of

Fig. 3.—Copper Trees. Solution containing free H<sub>2</sub>SO<sub>4</sub>—10 oz. to the gallon.

In a special message to Congress, dated February 10, 1899, the President says:

"As a consequence of the ratification of the treaty of peace between the United States and Spain, and its expected ratification by the Spanish Government, the United States will come into possession of the Philippine Islands, on the farther shore of the Pacific. The Hawaiian Islands and Guam becoming United States territory, and forming convenient stop-

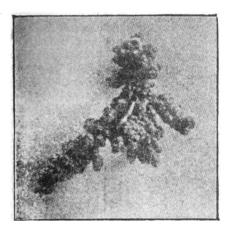

Fig. 4.—Copper Trees from Revolving Cathode.

solution. The author has tried the effect of various current densities, strength of solution, acidity of solution and temperature, and cathodes of various shapes. The three photographs above (Figs. 1, 2 and 3) show the formation of copper "trees" or "nodules" in a neutral solution and solutions containing various percentages of free acid. The inital current density in each case was from 60 to 70 amperes per square foot. This was found the best for the growth of copper "trees"; the copper de-

small "nodules," and in the other case the rotation lines can be distinctly seen, the cross lines being caused by a change in the direction of rotation, which took place about every 15 minutes; the current averaged about 15 amperes per square foot.

The Canadian Power Company of Niagara Falls, Ont., has changed its name to the Dominion Power Company. This company has a franchise for the operation of its plant from the Dominion Government to take water from Chippewa Creek for power purposes.

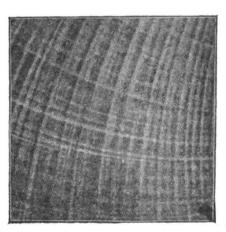

Fig. 6.—Deposit of Copper, Cathode making 32 revs. per minute.

ping places on the way across the sea, the necessity for speedy cable communication between the United States and all these Pacific islands has become imperative. Such communication should be established in such a way as to be wholly under the control of the United States, whether in time of peace or of war. At present the Philippines can be reached only by cables which pass through many foreign countries, and the Hawaiian Islands and Guam can

<sup>\*</sup>Abstract of paper read at the meeting of the American Institute of Electrical Engineers, New York, December 27, 1899.

<sup>\*</sup> From the Electrician, London.

only be communicated with by steamers, involving delays in each instance of at least a week. The present condition should not be allowed to continue for a moment longer than is absolutely necessary."

The idea of a British Pacific cable, connecting the Dominion of Canada with the Australasian colonies, almost from the first has been discussed from a national standpoint. Majesty's Government and the Colonial Governments most concerned have been nrged from time to time to consider the matter in its strategic and commercial aspects. Two colonial conferences, in 1887 and 1894, were largely occupied with this subject, as evidenced by the exhaustive blue books which record their proceedings. The Dominion Government took the matter up in 1893-4, and invited the most reputable firms in the world to submit estimates for construction and laying.

In 1896, Mr. Chamberlain, Secretary of State for the Colonies, appointed a Pacific Cable Commission, which included among its members the Under Secretary of State for the Colonies, the High Commissioner of Canada and the Agents-General for New South Wales and Victoria. This committee went into the whole subject of the practicability, cost, probable revenue, and management of the proposed enterprise and elicited a fund of technical, commercial, and professional information upon cable manufacture and cable laying in general, and upon this important project in particular, which is invaluable, and which probably could not have been obtained in any other manner. At this moment a Pacific cable touching only soil belonging to Great Britain is assured, both Canada and Australasia recently having been reported as joining with England in pledging themselves to the enterprise as a Government undertaking.

The proposed route is from Vancouver to Fanning Island, thence to the Fiji Islands, thence to Norfolk Island, and from there bifurcating to New Zealand and Queensland.

Since a Pacific cable will at last complete the telegraphic circuit of the globe, it will give the peculiar advantage of placing each point thereon in cable connection with every other point by two distinct routes either east or west.

The cardinal idea in the British system has been that all state cables shall touch only British soil, and this principle has placed British cable traffic in the Pacific forever at a disadvantage over the American cable for the reason that the only available route involves a single span of cable from Vancouver to Fanning Island, over 3,500 miles in length; whereas, by the annexation of the Hawaiian Islands, the United States, while following a similar principle, will have no span longer than the present Atlantic cables, or about 2,500 miles in length.

Since the speed of cabling decreases in general with the square of the length of the cable, and the speed of the whole system is limited by the speed of the slowest span, that system requiring the longest single span is ultimately at a disadvantage, provided the systems are in direct competition. In the projected Pacific cable enterprises, however, although, as will be pointed out later, they will operate in close relations with each other, yet each has a sufficient prospective traffic to guarantee the enterprise as a sound financial success from the beginning.

AMERICAN CABLE ROUTES.

In the consideration which, from time to time, has been given the project of spanning the Pacific Ocean by a submarine cable, the Northern route, via Alaska, the Aleutian Islands, Siberia and Japan has been frequently proposed.

In recent years the British Government, in its proposed line from Canada to Australasia. first projected this northern route owing to the absence, at that time, of information respecting the Southern Pacific Ocean, and the impression which prevailed that physical difficulties existed which offered insuperable obstacles to the laying of a cable on a direct route between Canada and Australasia. In consequence of this impression it was designed to lay the cable from Vancouver to Japan, touching at islands in the Aleutian and Kurile groups as mid-ocean stations. From Japan the connection with Australasia would have been obtained via Singapore and the Eastern Extension Company's lines of telegraph. Through the intervention of the Government, negotiations were opened with the view of securing one of the Kurile Islands. Japan was asked to transfer to the British crown one of these islands in order that the telegraph station should be under British protection, and an agent was sent to Washington who, after some difficulty, obtained conditional landing privileges on one of the Aleutian Islands.

Recently there has been a revival of interest in this route, especially now that the growing commercial interests of Alaska are becoming important. The plan proposes starting from Cape Flattery, thence to Sitka, distances (approximate) 803 miles; thence to Kadiak Island, 682 miles; thence to Dutch Harbor, 770 miles; thence to Attu, 810 miles; thence to the Japan-Russian border, 858 miles; thence to the Japan-ese land lines, 810 miles; from the Siberian border to the Siberian lines, 617 miles; and from Formosa to Luzon, 200 miles; in all 5,550 nautical miles, exclusive of the Japanese system.

It will be noticed that this series of cables aggregating 5,550 miles makes no provision for American communication with the Philippines, except over the Japanese land lines from the north point of Japan to the south point of Formosa, a distance through a foreign territory of about 1,200 miles. Owing to the uncertainty of the Japanese land lines, which are frequently interrupted during the typhoon season, particularly in Formosa, it would be necessary, in order to insure communication, to extend the Japanese cable system. Again, the Great Northern Telegraph Company, a Danish corporation, has exclusive rights, not only on the Siberian coast but also between Japan and the Asiatic coast.

Apart from establishing telegraphic communication free from foreign control between the United States, the Hawaiian Islands, the Philippine Islands and the island of Guam, the mission of an American Pacific cable should be to bring about a general reduction of cable rates.

On the Alaskan route, a large number of intermediate stations must be established and maintained; and there must be a division of receipts with Japan. A message via Honolulu, an intermediate island station and Guam, would reach Luzon by four cable transmissions. The Alaskan route as proposed would necessitate about fifteen separate stations, of which nearly one-half would be under Japanese control.

Undoubtedly an Alaskan cable will soon be required, and apparently also the extension of such a cable system as a means of attaining a through line to the Philippine Islands is an attractive plan. This plan, however, leaves the United States in practically the same unsatis-

factory position she is in at present in respect to communication with her Pacific possessions, and until definite and perpetual concessions are forthcoming, can furnish even no guaranty of substantial reduction from the present high rates

It is believed that no one studying the true present and future interests of the United States can come to any other conclusion relative to an American Pacific cable, than the one so admirably expressed by the President in his special message to Congress, viz., that this cable shall be "wholly under control of the United States."

This cardinal idea- the principle also adopted by Great Britain, after years of exhaustive consideration—at once excludes the northern route for the present, and limits the route to American territory.

#### PRACTICABILITY.

There is no longer any doubt as to the practicability of the Pacific cable project from a technical and engineering point of view. A preliminary survey between the coast of California and the Hawaiian Islands was completed by the Navy department in 1892, showing the entire practicability of this part of the route. Between California and the Hawaiian Islands several approximately parallel routes are practicable, but the one which seems to be favored by the survey of 1892, as shown in the report of the Hydrographic office of the Bureau of Navigation, is a rhumb-line between Monterey Bay and Honolulu on Oahu Island. The U.S.S. Nero, under command of Commander Charles Belknap, U. S. N., has been engaged since April last in a survey of the bed of the Pacific along the proposed route of the cable from the Hawaiian Islands westward to the Philippine Islands and to Japan. A preliminary report of this survey, recently received, adds greatly to the knowledge of this part of the Pacific and to the data necessary before determining the exact route of the cable. This survey develops two unusual physical features along the route via Midway Island, one of these is a submarine mountain, situated a short distance westward of the Midway Islands and rising from the floor of the ocean, having a depth of 2,200 fathoms to within 82 fathoms of the surface. The second feature is one of the deepest submarine abysses yet found in the world, situated about 500 miles eastward of Guam and more than 4,900 fathoms in depth. These and other obstacles which may be found, however, can be avoided in laying the cable by making suitable detours around them as is ordinarily done.

### A MID-OCEAN ISLAND CABLE STATION.

The great decrease in speed and increase of cost consequent upon increase of length of a single span of the cable, requires a landing station, if possible, between the Hawaiian Islands and Guam. The longest cable yet laid and in operation is the French cable from Brest, France, to Cape Cod, Mass., which is about 3,250 nautical miles in length, and there is no question that a cable directly connecting Honolulu and Guam could be successfully laid. if no practicable landing place between these points could be obtained. This single span, however, about 3,650 nautical miles including "slack," would for all time so reduce the through speed of the cable, and so increase the original cost, as to warrant unusual expense, if necessary, in preparing and maintaining an intermediate station. In this connection the large amount of technical evidence given before the British Pacific Cable Committee relative to the Vancouver-Fanning Island span,

which is practically the same extreme length of 3,600 nautical miles, and of the utilization of Fanning Island as a station, are valuable as showing entire practicability. Although both Wake and Midway Islands, which have been proposed as stations, are low atolls, rising but a few feet above high water and with little to sustain human life, yet either of these places is equal, if not superior, to Fanning Island. Further careful surveys will be necessary before the exact route west from the Hawaiian Islands to Guam can be finally determined. Fortunately for this enterprise, the annexation of the Hawaiian group brought under the sovereignty of the United States eleven or twelve small, rocky or sandy islands extending to the northwestward about 1,800 miles from Honolulu. These must be surveyed and considered from the cable standpoint before a final selection of route can be made.

The distances in nautical miles along two provisional routes, including ten per cent, for "slack" in laying, are as follows:

San Francisco to Honolulu	2,286	miles,
Honolulu to Midway Island	1,254	••
Midway Island to Guam	2,523	••
Guam to Dingala Bay, P. I	1,496	4.
Total via Midway Island	7.559	
San Francisco to Honolulu	2,286	miles,
Honolulu to Wake Island	2,205	4.
Wake Island to Guam	1,435	
Guam to Dingala Bay, P. I	1,495	
Total via Wake Island	7,422	**

#### COST, MAINTENANCE AND OPERATION.

The cost of laying cable depends mainly upon the materials used in its construction, and therefore fluctuates with prices current. The outer coverings are much the same in all specifications, according to the conditions of the case, but the copper conductor and the gutta-percha insulation vary with the speed required over the cable. Since the length of the longest section of the proposed Pacific cable is approximately equal to each of several of the Atlantic cables, the type of the cable to be used for this section, and the speed obtainable are subject to a close estimation.

Of the eleven cables spanning the north Atlantic, the Anglo-American Company's cable laid in 1894, and the Commercial Cable Company's cable No. 3 laid also in 1894, have the greatest speeds. The former contains 650 lbs, of copper and 400 lbs. of gutta-percha, and the latter 500 lbs. copper and 320 lbs. gutta-percha per nautical mile. Either of these types of cable would give good results and no cables of less equivalent speed should be considered.

The following conservative estimate is made from the evidence obtainable relative to the establishment of this enterprise by the Government on a sound financial basis:

#### MAINTENANCE AND REPAIR PER ANNUM.

Annual expenses of two cable repair ships	\$200,000
Annual expense for new cable, assuming entire cable	
to be replaced in 40 years, or 200 miles per year	200,000
Working expenses	125,000
Reserve fund and interest on capital	400,000
Total net earnings of cable required	\$925,000

This provision for laying 200 miles of new cable per year should perpetually maintain the value of the cable as an asset, and the reserve fund further provides that the entire capital shall be replaced at the end of fifty years, or what is equivalent that a sinking fund shall be established, which, at the end of fifty years will be sufficient to lay an entire new cable in addition to the permanent maintenance of the original one, so that at the end of fifty years two working cables will be provided for.

Taking average conditions for long cables ten

years ago, the annual expenses for maintenance and repair, e. g., for new cable required, etc., and not including the fixed expenses such as the repair ships, was about \$30 per nautical mile. The great advancement in cable manufacture since has reduced the average repair rate materially, but assuming this rate as it then averaged, the total charge to this item is practically the same as that given by the independent supposition above

At present there is no first-class cable ship in the world flying the American flag and which would therefore be under the control of the United States in time of war. It should be the policy of the United States, whether the Pacific cable is laid by the Government or by a subsidized company, to require that two complete cable repair ships, one, at least, also capable of laying long cables equal to any yet constructed for these purposes, and flying the American flag, be stationed in the Pacific ocean.

#### PROPOSED MANAGEMENT OF THE CABLE AS A GOVERNMENT ENTERPRISE.

Assuming that the proposed Pacific cable will be established by the Government, opportunity will be presented in this new and unoccupied field of the Pacific, unfettered by precedent and obligations, to introduce such radical changes in the policy and business management of the enterprise as will operate advantageously to the whole people who are directly concerned. and for whom the cable is primarily built, Private corporate management naturally aims at large dividends for its stockholders. It is a matter of statistics that in cabling throughout the long distances involved in the East, out of every one hundred messages sent, ninety-nine are purely commercial in character, and one of private nature. Cabling throughout the world is so expensive that it is only resorted to for urgent commercial purposes. The present tariff rates strictly limit the kind of traffic offered, and prohibit all other than that of the most urgent nature, and are sufficiently high to keep the long cables actually idle for a considerable portion of each twenty-four hours. The enormous volume of the present mails indicate that the world's cable plant could be duplicated many times and all kept full to overflowing if the cable rates were sufficiently reduced.

#### CONCLUSION.

After several years of comparatively little advance, the technical and scientific side of telegraphy has received much attention during the past two or three years, until at this moment there is no other special branch of electrical engineering which is more in evidence or promises more for the future.

By whatever method the first Pacific cable is ultimately laid, and provided that it shall appear that all of the projected cable cannot be manufactured and laid in the United States within a reasonable time, it seems plain that the encouragement of American manufacturers in the building up in the United States of a deep sea cable industry of the first-class is a wise policy for this Government.

The successful completion of the submarine cable across the Pacific will mark an epoch in the telegraph history of the world. After thirty years of consideration-technical, commercial and political—the end of this century sees this great enterprise at last seriously undertaken. The full influence which it will exert upon the Western Hemisphere and the world in general is not easily appreciated. Strategically, the importance of this inter-

colonial communication and its preservation are very great. However, the Philippine question should not overshadow the larger question the Eastern question—in the consideration of this project. Important as the cable will be as a means of joining the Philippine archipelago to the United States, its larger importance will ultimately be in the future of the commercial development between the United States and the East. In the broad extension of the Pacific trade consequent upon the completion of the Isthmian canal and the development of steamship lines plying the Pacific, the telegraph cable will naturally become an important factor. The trans-Pacific steamship lines are heavily handicapped by the absence of a direct means of telegraphy between the ports embraced in their routes. Situated on the main trade routes leading from the Isthmian canal to Asiatic ports, the Pacific cable will serve as a powerful adjunct and support to this enterprise. The two go hand-in-hand and are mutually closely related. It can be stated that there is scarcely any point in the world where there is greater need for a central cable station than in the Hawaiian Islands Geographically situated at the military and commercial strategic position of the North Pacific Ocean, it will ultimately serve as the distributing center of ocean communication between the two hemispheres, as well as to various island groups of the Pacific.

As to the probable traffic to be immediately expected there is little direct evidence at hand. since the waters spanned have never before been crossed by a submarine cable. Taking \$150 as the average earning power per nautical mile of the long cables of the world as a basis, this project should prove a paying investment from the very first, but it is believed that this estimate, based upon the average of cables, will prove under rather than above. particularly as this route will immediately enter as a competitor for European traffic via the Atlantic cables and United States land lines. The immediate effect of the trans-Pacific cables will be to lower the rates to the East. since European traffic will be open to competition, east and west, and the new Western route, due to the long spans and comparatively few repetitions will have an advantage.

A short span of cable of about 200 miles between Luzon and Formosa connecting with the Great Northern Telegraph Company's route through Siberia and also between Luzon and a Chinese port will bring Japan and China into direct connection not only with the North American Continent, but also by two competitive routes east and west with Europe. In fact, the laying of the Pacific cable should operate to readjust the present cable through tariff rates throughout the world upon a lower basis.

#### Electrical Activity in Germany.

In a communication to the N. Y. Times Mr. James C. Monaghan, United States Consul at Chemnitz, states that in electricity and electrical appliances, Germany leads Europe, if not the world. She has 711 miles of electric railroads, or more than all the rest of Europe combined. England has only 98 miles. All the large towns have electric roads, and by 1901 Berlin will not have anything else. New roads are being projected in almost every city. The movement back to the country, so characteristic of our own people, has reached Europe. The Patakys, well-known patent lawyers of Berlin, wrote recently as follows: "The outlook for American manufacturers in Germany is perhaps brighter than in any other European

#### EWING'S SINGLE-RAIL TRAMWAY.\*

The accompanying figures illustrate the single-rail tramway invented by Mr. Charles Ewing. The special advantages claimed for this system are simplicity, cheapness, speed of construction, and small tractional resistance.

Quoting from a paper read before the United Service Institution of India by Lieut. Col. F. F. R. Burgess, I.S.C.:

"On a level road one pair of bullocks can, on a single line, draw a train of trucks, carrying a net load of from six to seven tons, a distance of 15 miles in a day with ease; it requires from 16 to 18 pairs of bullocks to draw this load in ordinary carts carrying the military regulation 800 lbs. load.

"The trucks run on a single line of rail laid on the ground or roadway, and are mounted on two or three double-flanged wheels placed under their center. These wheels are of small diameter, varying from 15 to 30 inches, according to the size and weight of the trucks and rails, the flanges being twice as far apart as the width of the head of the rail on which the wheels run.

"The whole weight of the truck is thus borne on two or three double flanged wheels which run on the single rail, so that, unless it was supported in some way, it must fall over. The necessary support is afforded by a lightly constructed iron 'balance' wheel of comparatively large diameter, from four to five feet, with a four inch wide tire, placed at the side of the truck.

"This balance wheel runs on the surface of the ground or roadway about 4½ or 5 feet away from the rail. It runs on an axle which is pivoted at right angles to the center of the truck and is kept in position by a hornplate fixed to the frame of the truck. The axle is also furnished with a double helical spring which eases the jolting of the balance wheel when going over any inequalities. The platform of the truck, which carries the load, extends to an equal distance on each side of the central line of the truck over the rail and flanged wheels, and the load would usually be evenly distributed on it, but should it not be so, there would be no risk of the truck upsetting, as the balance wheel provides against this, and an excess of several hundredweight may be placed on the far side, away from the balance wheel, without risk. This is due to the fact that the balance wheel is placed at a considerable distance away from the side of the truck, generally 5 feet from the center of the light 1 ton truck, which has a 6 foot wide platform, and the leverage thus afforded enables a light balance wheel of only about 160 lbs, weight to balance more than three times its own weight of excess load on the far side and thus allow for careless loading, etc.

"The balance wheel does not bear any of the weight of the load on the truck, and but a very small proportion of the weight of the truck itself, and, therefore, causes very little loss of power through frictional resistance, especially on a smooth surface.

"The axle of the balance wheel may either be straight or cranked; in the latter case it goes under the platform of the truck, leaving it perfectly flush and clear for the load, which is an advantage: but for certain purposes it may be better to have the other pattern, which allows of the center of gravity being considerably lowered, as the platform can be made

very low, only 8 inches above the road suface, if required.

"The truck runs very smoothly, and requires very little force to start it on level ground. It is strongly but lightly constructed of teak or other suitable wood, and is fastened with iron nuts and bolts. It is very light in proportion to the load it is intended to carry, which itself is only limited by the weight of the rail and

ing roads are laid on small wooden sleepers to which they are spiked in the usual manner. These sleepers are 18 inches long, 8 inches wide and 3 or 4 inches thick."

There is no keeping the rails in gauge as in a double line, and it does not matter if the rails shift a little, a serious matter with a double line; the cars can be run with ease round curves of 25 feet radius, or even less.

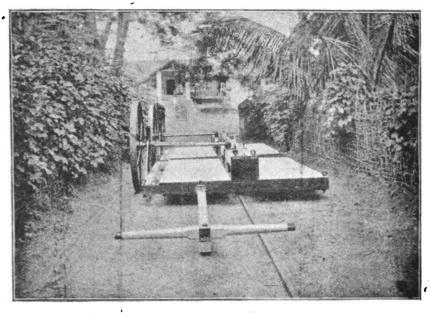

Fig. 1

the description of rolling stock carrying it."

Fig. 1 is a front view and Fig. 2a side view of a pair of empty trucks to carry 3½ tons each.

"The rails used on this system are of the ordinary railway description, and their size and weight vary according to the work required; for instance, in the light planter's line on this system, such as that on Messrs. Finlay,

To enable trains of cars to pass each other, each truck carries a ramp fitting the head of the rail, attached to a single rail; when two trains meet, these spare rails are used to make a temporary siding, on which one of the trains is run.

Bullocks are generally employed for haulage; but two men can easily propel a truck carrying a load of 1 ton at a walking pace. Various pas-

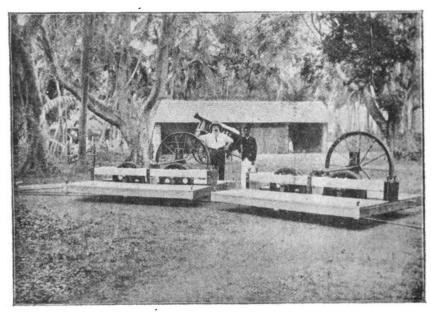

Fig. 2.

Muir & Co.'s estates in the Travancore Hills, some 22 miles in length, the rail used weighs only 14 lbs. to the yard, the two-wheel trucks running on it carrying loads of 1 ton each, this light rail being only intended to bear the gross weight of three-quarters of a ton per wheel: but where heavier loads are required to be carried on larger and heavier trucks, a heavier rail would be necessary.

"Single line rails for ordinary use on exist-

senger cars, ambulances, etc., have been designed for use on this system.

The application of electric haulage to a line of this description appears to present no difficulties. A light trolley line carried on wooden brackets, and locomotives of similar design to the trucks, would afford a cheap equipment suitable for light traffic on either a temporary or a permanent line. Working on the principle of small loads at frequent intervals, electricity

<sup>\*</sup> From the Electrical Review, London.

would be at its best, and would compete favorably with any other mode of haulage.

#### TO COMPETE WITH AMERICANS.

#### An English Electrical Scheme with Prof. Sidney Short as Engineer.

The establishment of a plant for the manufacture of electrical traction equipment on a large scale in England, with the avowed object of meeting all comers, is of interest to American manufacturers. F. H. Armstrong, one of the chief engineers of Dick, Kerr & Co., Ltd., the large English electrical engineers and contractors, is now in this country looking up the latest American innovations in electrical apparatus, with a view to making additional purchases of equipment for the large plant which is being built for the English Electrical Manufacturing Co. at Preston, in the vicinity of Liverpool. In conversation with a representative of the New York Commercial Mr. Armstrong said:

"The new plant, which will be equipped with the most up-to-date American machinery, consists of three main buildings, the machine shop, the foundry and the power house. The total area under roof is 182,260 square feet, or about four and a half acres. In the buildings there will be nearly 400 of the latest American automatic machine tools, which have been designed especially for the manufacture of electrical machinery.

"The general arrangement of the buildings and machinery will be such that the raw material will move continuously from the receiving end to the testing and shipping departments, from which it will emerge as a finished product.

"The works will employ 4,000 hands; British workmen only will be employed.

"At the outset it was recognized that such an undertaking could only succeed in competition with American manufacturers by frankly making use of American experience and skill, hence the first step that the promoters of the enterprise undertook was to find the right man to manage the concern. The services of Prof. Sidney H. Short were secured. Prof. Short was lately chief engineer of the Walker Company of Cleveland, and is considered to be one of the greatest living electrical engineers of to-day.

"The second step was to carefully study the best and latest American practice, and for this purpose the promoters visited the United States.

"Thirdly, it was felt that only by entering into competition on a very large scale could success be achieved, for without being able to command a similar output to the great American firms the English venture would be at a conspicuous disadvantage.

"Preston was chosen as the site of the new works, owing to its rail and shipping facilities and its contiguity with the supply of coal and iron.

"Now for the market. In the first place, the new company believes that it can successfully compete for British contracts at home, and it counts upon a largely increased demand from this source during the next few years.

"In the colonial market the promoters of the plant believe that the fact that the great trade routes are to and from Great Britain will give them an advantage against rivals who must tranship at a British port.

"On the Continent there is also a large field. In brief, the field embraces the world with the

single exception of the tariff-protected United States."

On being asked if he could give any reason for his belief that the new enterprise could compete with old-established American companies, Mr. Armstrong said: "Certainly. We shall have the benefit of other people's experience without paying for it. The great electrical manufacturing firms in America have reached their present state of perfection only after a long course of costly experiments. Expensive machinery has been bought and cast aside, and the works have been remodeled again and again. Hence for the business they are now doing they are vastly overcapitalized, and that deadweight of expended capital will give us a considerable advantage.

"Then, too, their lack of continuity, owing to combinations and trusts, is a source of considerable weakness. A continental firm had for years been purchasing goods amounting to close on \$1,000,000 per annum from an American concern. One day my friends were suddenly informed that the American firm had ceased to exist. It had been absorbed in a gigantic concern and had closed down. At one stroke the continental firm's whole business was thus gone, current orders were not executed, and they could never obtain any of the parts needed to repair the machinery which was installed in their plant."

Over \$300,000 worth of equipment for installation in the Preston works has already been purchased in the United States and Mr. Armstrong anticipates the placing of contracts for machine tools of at least \$100,000 during his present trip.

#### THE MUNICIPAL ELECTRICIANS.

## They are Arranging for an Important Convention at Pittsburg.

Capt. William Brophy, of Boston, president of the International Association of Municipal Electricians, had a conference with the executive committee of that association at the Hotel Imperial in this city last week, and outlined the plans for the annual meeting to be held in Pittsburg.

Mr. Morris W. Mead, chairman of the executive committee, promises something interesting in the way of papers to be read. He said:

"Our president, Mr. Brophy, has sent out several hundred circular letters to the heads of the departments of electricity in this country and Canada asking for opinions as to what are considered the most important problems that now confront the municipal electricians,

"The idea in this is to get them interested and bring them together for mutual improvement, with the final benefits, of course, to ge to the municipalities which they represent.

"Though no definite arrangements have been made for the convention, several important questions will come up for debate. There is one point on which we all seem to agree, and that is that all of the different bureaus of electricity in a city should be combined under one head, making that head responsible for their handling. The different branches are divided now, and there always is a question of responsibility that cannot be decided.

"Another thing of interest will be a discussion on contact points. This question is creating a great deal of interest just now because of the innumerable new and surprising uses of electricity. Safety from fire and protection from injury or death from shock will form a

large part of that discussion, as the protection of property and human life necessarily depends largely upon proper insulation.

"Electrolysis may come up for discussion and I consider its study intensely interesting. Certainly a grave problem is presented where a municipality finds its vast systems of gas and water pipes and all iron underground being eaten away by that queer little 'electric bug.' If we knew how to prevent electrolysis economically we would know how to prevent the leakage of electricity, but we haven't reached either point perfectly. It will be a great day, indeed, when we are able to produce energy at one point and transmit it, no matter how many miles, in its original force, without the loss of an ounce."

#### ELECTRICITY DRIVING OUT GAS.

#### The Real Cause of the Rockefellers Buying the Light, Heat & Power Company.

(From the N. Y. World, Jan. 5.)

It developed yesterday that one of the objects of the purchase of the New York Gas and Electric Light, Heat and Power Company by the Consolidated Company was to materially increase electric lighting among private consumers.

The demand for electric lighting in residences has grown tremendously within the past year, and those familiar with the situation say that gas will soon be a secondary factor as an illuminant in the city.

The growth of electrical lighting has cut into the business of the gas companies considerably, and of late it has assumed such formidable proportions that the Rockefellers have been forced to recognize it.

To provide for the future prosperity of the Consolidated Company they have been obliged to secure control of the business of electric lighting.

Nearly all of the residences and apartment houses of the better class erected within the past year in Manhattan and the Bronx include provision for lighting by electricity and older houses are being fitted with the necessary fixtures.

The large profits in the electrical business will compensate for decreased profits on gas supplied at the low rate and allow the Consolidated to maintain its war upon the New Amsterdam Company until that corporation surrenders on the Rockefellers' terms. The Standard Oil people declare they will not pay a dollar for the New Amsterdam common stock, as it was given away, they assert, to the insiders at the time of the organization of the company.

The New Amsterdam people profess not to be worried by the recent move on the part of the Consolidated, [and President Jourdan pointed yesterday to the fact that by the charter of the East River Company, one of its constituent concerns, the New Amsterdam can go into the electric-lighting business if necessity should arise.

The financial details of the purchase of the Electric Lighting Company by the Consolidated are still withheld.

#### Are We to Lose Tesla?

COLORADO SPRINGS, Col., Jan. 6.—Nicola Tesla, who established an experimental station here in May last, will shortly return to New York City for a brief business visit. Mr. Tesla finds this climate conducive to his health, and

the 6,000 feet altitude proves to be all that can be desired for his work. It is understood here that he may remove his New York laboratory to Colorado Springs and permanently settle here.

#### LEGAL NOTES.

A settlement was recently effected in the case of the present owners of the Pittsburg and Birmingham Traction Company against H. Sellers McKee, Murray A. Verner, Pittsburg, and E. W. Clark & Co., Philadelphia, in which the plaintiffs sued to recover \$1,000,000 alleged to have been wrongfully spent by the defendants in changing the power of the Birmingham Company from horses to electricity. It was alleged in the bill that the defendants diverted a large sum to themselves. The terms of the settlement were not made known, but the demeanor of the plaintiffs and their attorneys indicated that they were well satisfied with them.

In a decision just handed down the Appellate Term of the Supreme Court of New York discussed the duty which conductors of street cars owed to the passengers on their cars. In the opinion of the court, written by Justice Leventritt and concurred in by Justices Freedman and MacLean, the court held that when a conductor had issued a transfer to a passenger he should be presumed to know that the passenger desired to alight at the place for which the transfer had been issued. "It might also be said," ruled the court, "that points for which transfers have been issued bear some resemblance to regular stations of steam railroad companies, where it is incumbent on them to stop long enough to allow passengers a reasonable time to alight, whether or not the conductor knows of any passenger desiring to leave the car." The decision of the court was made when it reversed a ruling of the Trial Term of the Supreme Court, dismissing a suit brought by Mary Schaefer, described by the court as a washerwoman, against the Central Crosstown Railroad, to recover damages for personal injuries. In reviewing the facts in the case, the court said that Mary Schaefer had not been guilty of contributory negligence because she alighted from the car without taking hold of the railings to guard against sudden movements of the car, nor because she had her washbasket in her hands, and said she was entitled to a new trial of her suit.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended January 6:

Amsterdam, 3 cases, \$85; Athens, 3 cases, \$26; British Australia, 5 packages, \$648; Canada, 8 cases, \$56; Florence, 24 packages, \$613; Hamburg, 95 packages, \$1,675: Havre, 104 packages, \$2,072; Hayti, 10 packages, \$60; Liverpool, 3 packages, \$1,200; London, 102 packages, \$4,449; 11 electrical machines, \$1,242; Rotterdam, 7 cases, \$75; Santo Domingo, 35 cases, \$3,544; Southampton, 4 cases, \$160; Stettin, 1 case, \$151; St. Petersburg, 1 case, \$154; Uruguay, 13 cases, \$150; U. S. Colombia, 16 cases, \$141.

#### Attractive Calendars.

We desire to acknowledge the receipt of an unusual number of attractive calendars for 1900. Two from the Okonite Company consist of large and handsome photographs of scenes in London. That received from the American Electri cal Works of Providence, R. I., is in keeping with the other

quaint and original souvenirs gotten up by this well-known oncern for state occasions. On the front and over the calendar is a handsomely engraved portrait of Benjamin Franklin, with a condenser and reel of wire on one side, and the famous kite and key on the other. On the back of the calendar the following inscription appears:

Among the best known of the early experiments in electricity are those of

Among the best known of the early experiments in electricity are those of BENJAMIN FRANKLIN.

that "many-sided genius," as he has been so aptly termed. As printer, publisher, patriot, statesman, diplomat, philosopher and philanthropist—whatever he did he did well, and his fame is world wide. His electrical experiments, particularly his kite flying, when he "wrested the lightning from the clouds," are inseparably connected with his name. These experiments, while they would be deemed crude in the light of the present day, were, in his time, most novel and evolved the fundamental principles upon which the later great discoveries in electricity were based. Therefore the use of his portrait in connection with the name of a company so long devoted to the manufacture of high-grade electrical wires and cables seems to us eminently appropriate.

American Electrical Works,

AMERICAN ELECTRICAL WORKS, Providence, R. I.

#### PERSONAL MENTION.

Mr. Herbert S. Wagner, formerly general superintendent of the Missouri-Edison Electric Company at St. Louis, is now president of the Mississippi Valley Automobile Fransportation Company, but will still remain consulting electrical engineer of the Missouri-Edison Electric Company. His successor as general superintendent is Mr. M. S. Holman.

Mr. Fred. A. Nash has been elected president of the Omaha (Neb.) Thomson-Houston Electric Light Company in place of the late Thomas L. Kimball.

Mr. L. F. Duggan of Wichita, Kan., has been appointed general inspector of the Missouri and Kansas Telephone Company, with headquarters at Kansas City.

Mr. F. E. Drake, Director of the United States Machinery and Electricity Departments of the Paris Exposition, sailed from New York January 4 on the Kaiser Wilhelm. Captain Mattox will go as soon as the final arrangements have been perfected on this side of the water.

Mr. Campbell W. Adams, formerly State Engineer, has been appointed by the Empire State Power Company of Amsterdam, N. Y., to succeed the late Mr. Dewitt A. Devindorf, who had charge of the work on the electrical plant at Schoharie Falls

Mr. E. H. Mather, formerly assistant general manager of the Connecticut Lighting & Power Company, has resigned to accept the position of treasurer of the Portland (Me.) Electric Light Company, where he will represent the Boston banking house of George A. Ronald & Co.

Mr. James Hamblet, who had been manager of the Western Union time service for twenty-five years, died on January 2 at his home, 20 Sydney place, Brooklyn, in his 75th year. He was also president of the Department of Electricity in the Brooklyn Institute of Arts and Sciences.

Mr. C. Loomis Allen recently resigned his position as general manager of the Rapid Transit Railway Company at Syracuse, N. Y., and is now general manager of the Lorain (Ohio) Street Railway Company.

#### INCORPORATIONS.

The Rockland Electric Company, Jersey City, N. J .- to furnish electricity. Capital stock, \$100,000. Incorporators: J. C. Young, F. B. Hyde and W. J. Wright, all of Jersey City.

The Oakland Electric Company, Waterville. Me.-to generate and apply electricity. Capital stock, \$10,000. Incorporators: W. S. Wyman, G. K. Boutelle and H. D. Eaton, all of Waterville.

The People's Light Company, Davenport, Ia.-to manufacture gas and electric light. Capital stock. \$250,000. Incorporators: A. W. Vander and J. S. Wylie, both of Daven-

The Lexington Gas & Electric Company, Lexington, Mass--to manufacture and sell gas, light, heat and fuel. Capital stock, \$40,000. Incorporators: E. I. Garfield, C. H. Miles and J. S. Miles.

The Niagara Falls Gas & Electric Light Company, Niagara Falls, N. Y. Capital stock, \$100,000. Directors: Harry Highland, Amasa A. Oatman, Elizabeth Read, Niagara Falls; Walter D. Ingham, Buffalo, and David W. McNair, New York

The Toledo, Tiffin & Sandusky Electric Railway Company, Port Clinton, O. Capital stock, \$3,000,000. Incorporators: R. W. Browne, George D. Loomis, J. M. Naylor, Frank C. Anderson, S. P. Calef, S. B. Sneath, Richard Young, J. F. Bunn, John McCauley, C. J. Yingling, B. W. Crobaugh and John C. Rover.

The European Railway Electric Lighting Company, New York City-to deal in apparatus for producing heat, light, power and gas. Capital stock, \$5,000,000. Stockholders: James G. Gregg, Frederick C. Rowly, Frank M. Wells, William E. Jackson and Alfred P. W. Seaman, all of New York.

#### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 305, 507 and 309 Broadway (Room 801), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR 4. MICHEL, Nos. 305 309 Broadway, New York City. N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon pay-

ment of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED JANUARY 2, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

640,204. Trolley. Charles A. Jackson, Lewiston, Me., assignor of one-half to Fred A. Cram, Auburn, Me. Filed

signor of one-half to Fred A. Crain, Adburn, Me. Filed Feb. 16, 1899. 640,590. Trolley. Alfred N. Hauver, Fitchburg, Mass., as-signor of one half to Herbert E. Jennison, same place. Filed May 31, 1899.

#### ELECTRIC LIGHTS AND APPLIANCES.

ELECTRIC LIGHTS AND APPLIANCES.
640,362. Incandescent Lamp Holder. Leo Canda and Henry R. Bothwell. Cincinnati, O.; said Bothwell assignor to said Canda. Filed May 5, 1899.
640,363. Electric Incandescent Lamp. Francis M. F. Cazin, Hoboken, N. J. Filed March 21, 1899.
640,371. Reflector for Electric or Other Lights. John C. Fleming, Philadelphia, Pa. Filed March 2, 1899.
640,465. Incandescent Lamp. Elmer W. Gillmer, Warren, O. Filed March 4, 1886.
640,492. Shade-Holder for Incandescent Electric Lamps. Edgar A. Russell, Wallingford, Conn., Filed July 25, 1898.
640,493. Shade-Holder for Electric Lamps. Edgar A. Russell, Wallingford, Conn., and Harold Serrell, Plainfield, N. J., assignors to said Russell. Filed Oct. 28, 1898.
640,729. Electric Lamp. Willis A. Fenner, Providence, R. I. Filed May 15, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

ELECTRICAL MACHINERY AND APPARATUS,
640,196. Electric-Meter Device. Caryl D. Haskins, Newton,
Mass., assignor to the General Electric Company of
New York. Filed Oct. 26, 1898.
640,344. Electric Transformer. James W. Packard and
Henry W. Wiswell, Warren, O. Filed June 23, 1898.
640,466. Rate-Indicator for Electric Currents. Jesse Harris,
Albany, N. Y. Filed Aug. 1, 1899.
640,688. Speed-Governor Attachment for Electrical Apparatus. James H. McGurty, Jersey City, N. J., assignor of
forty-nine one hundredths to Thomas McEwan, Jr., same
place. Filed April 7, 1899.

#### TELEPHONES AND TELEPHONE APPARATUS.

640,404. Telephone Central-Station Apparatus and Circuits, Samuel G. McMeen, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass, Filed July 31, 1899.

31, 1899.
413. Coin-Operated Public Telephone-Call Instrument, Frederick J. Clendennin, Hawksburn, and George A. P. Weymouth, South Melbourne, Victoria. Filed Jan. 20, 1808.

640.618. Telephone-Exchange System. Thomas F. Ahern, Detroit, Mich., assignor to the Detroit Switchboard & Telephone Construction Company, same place. Filed June 26, 1899.

#### MISCELLANEOUS.

Telephone Construction Company, same place, Filed June 26, 1899.

MISCELLANEOUS.

640,192. Electric Cloth-Cutter. Fulton Gardner, Chicago, Ill. Filed Jan. 13, 1898.
640,205. Milking Apparatus. Daniel Klein and William P. Swartz. Poughkeepsie, N. Y. Filed Dec. 19, 1898.
640,258. Electric Heater. Force Bain, Chicago, Ill., assignor to the George L. Thompson Manufacturing Company, Cook County, Ill. Filed Sept. 30, 1898.
640,273. Acoustic Alarm System. Clyde Coleman, Chicago, Ill., assignor, by mesue assignments, of two-thirds to the Bankers' Electric Protective Company, same place. Filed Sept. 3, 1897.
640,278. Multiple-Signal Transmitter. Leonard Dawson, Needham, Mass., assignor to the Gamewell Fire Alarm Telegraph Company, New York City. Filed May 5, 1899.
640,316. Coin-Controlled Electrical Apparatus. John Patterson, Chicago, Ill. Filed June 2, 1899.
640,316. Coin-Controlled Electrical Apparatus. John Patterson, Chicago, Ill. Filed June 2, 1899.
640,333. Electric Water-Filter. William L. Teter and John A. Heany, Philadelphia, Pa. Filed May 25, 1899.
640,363-640,364-640,365. Terminal for Electric Cables. William L. Candee, New York City. Filed Feb 16, 1899, Feb. 17, 1899. Renewed Nov. 10, 1899.
640,371. Electric Fuse or Cut-Cutt. Louis W. Downes, Providence, R. I. Filed April 12, 1890.
640,372. Gas-Engine Ignition Device. George W. Lewis, Philadelphia, Pa. Original applications filed Nov. 8, 1894, and Aug. 17, 1894. Renewed Sept. 22, 1898. Divided and this application filed June 21, 1895.
640,479. Connector for Battery-Electrodes, Fuses, etc. William Mills, Elizabeth, N. J., assignor to the Eastern Carbon Works, Rahway N. J. Filed March 16, 1899.
640,515. Art of Distributing Electrical Energy by Alternating Currents. Michael I. Pupin, New York City, Filed May 28, 1895. Renewed Oct. 14, 1896.
640,533. Cable-Terminal. William Callahan, Toledo, Ohio, Filed Oct. 4, 1899.
640,535. System of Electrical Distribution. Alberts, Hubbard, Belleville, N. J., assignor to the Goold Storage Battery Company, New York City, File

#### GENERAL NEWS.

What is Going On in the Electrical World.

#### ' LIGHTING.

Alliance, Neb.—This city is contemplating the erection of an electric lighting plant.

Atlanta, Ga.-The Georgia Electric Light Company is preparing to make extensive improvements to its plant. G. W. Brine is secretary.

Blue Rapids, Kan.-W. L. Hall is figuring on an electric light plant for this place.

Caldwell, Tex.—A company is being organized to build an electric light plant here.

Casey, Ill.—An electric light plant is to be erected

Cincinnati, O.—G. G. Luthy, representing the Royal Electric Company of Peoria, Ill., is endeavoring to in-terest the board of city affairs in an electric lighting proposition.

Cleveland, O.—The county commissioners are considering the matter of installing an electric light plant in the court house at an estimated cost of \$8,000.

Denver, Col.—The citizens are talking seriously of establishing a municipal electric light plant.

Dunbar, Pa.—An electric light plant is to be established here. Among the Philadelphia capitalists interested are William Drest, John N. M. Shimet, Hazot Dickson, Wm. M. Kitzmiller and James McMullen.

Eatherville, Is.—This city contemplates making several thousand dollars' worth of improvements on its electric light plant early in the spring.

Greenville, D. C.—This city contemplates the erection of an electric light plant to cost \$75,000.

Lake Odessa, Mich.—The matter of putting in an electric light plant is under discussion, by the council of this place.

Langdon, N. D.—This city is contemplating the nichase of an electric light plant now owned by indi-duals. To meet the demand for light it will be nec-sary to expend \$3,500 on improvements.

Lexington, Ga.-G. H. Smith of this city wants estimates on an electric light plant of 250 lights complete, except boiler and engine; also on three miles of copper line wire for same, together with 100 insulators, brackets, arms, etc.

ets, arms, etc.

Long Beach, Cal.—Plans have been adopted by the city for erecting a new electric light plant, and bonds to the sum of \$32,000 will be issued for that purpose, C. I. Goucher, city engineer, can be addressed.

Neligh, Neb.—This town is contemplating the erection of an electric light plant.

Nicholasville, Ky.—This city will construct an electric light plant. Address J. D. Young.

Paulaborough, N. J.—This village is contemplating the erection of an electric light plant.

Racine, Wis.—An ordinance was lately introduced at the council meeting in favor of granting to ex-Mayor Secor the right to build, maintain and operate an electric lighting plant in this city.

Vassalborough, Me.—The Mill Company intends erecting an electric light plant at Davis's dam for lighting the village of Vassalborough.

Washington, Ind.—The city council has decided to purchase an electric light plant.

West Haven, Conn.—The citizens of this place are agitating the question of a municipal electric light

Winchester, Ky.—The Martin Construction Company, owners of the electric light plant, will install a duplicate plant. A 370 horse power Corliss engine and two new dynamos will be put in.

#### STREET BAILWAYS.

Asheville, N. C.—I. B. Wilford of Bowling Green, Ky., backed by Chicago capitalists will in a few weeks begin the construction of an electric railway from this place to Weaverville, a town eight miles north of here.

Barre, Mass.—A plan is on foot to build an electric railway from Barre station to the Center, three and one-half miles, including sidings. The cost of the road is estimated to be \$80,000.

Brooklyn, N. Y.—The Brooklyn Bapid Transit Com-pany, will extend its lines about two miles from Jamaica avenue over the Fresh Pond road.

Baffalo, N. Y.—The Lockport-Olcott trolley line, an extension of the International Traction lines, will become a reality this year. General Manager Van Horn promises to begin work in the early spring.

Clarksville, Tenn.—E. L. Buckley of New Providence is promoting the proposed electric railway between this place and New Providence.

Clinton, N. Y.—There is quite some talk of building an electric road from here to Utica.

Columbus, O.—The Toledo & Western Railroad Com-Columbus, U.—The Toledo & Western Railroad Company is to construct and operate an electric road from Toledo through Lucas and Fulton counties, to a point of intersection of the old Indiana plank road and the boundary line between Ohio and Michigan.

Detroit, Mich.—The franchise for an electric line bytween Port Huron and Bay City has been sold at De-

troit, by W. Wheat, of Tuscola, to E. M. Hopkins of New York, N. S. Boynton and associates. The road is to be 110 miles long, and will touch Caro, Sanilac Cen-tre, Crosswell and Lexington.

Fort Wayne, Ind.—The Indiana & Ohio Traction Company which is to build an electric railway from Hicksville, O., to Marion, Ind., by way of this city, Huntington and Wabash, is now negotiating for the purchase of the line from Marion to Gas City.

purchase of the line from Marion to Gas City.

Hagerstown, Ind.—J. O. Barrett of the Indianapolis and Greenfield Electric Bailway Company says as zoon as the line is completed to Greenfield from Indianapolis the work of extending it will be commenced. Knightstown, 12 miles east of Greenfield, will be included, and a spur constructed south to the Soldiers' and Sailors' Orphans' Home. A branch line will be built to Newcastle, and thence east to this place and on into Richmond. It is stated that the road will eventually be built into Cincinnati. built into Cincinnati.

Hempstead, N. Y.—The Mineola, Hempstead & Free-port Traction Company, which wishes to build a trolley line from Mineola to Freeport, has received a franchise from the trustees of this village to construct and operate the proposed trolley line within the corporate limits of Hempstead village.

Kansas City, Mo.-R Gebtry and B. Corrigan have formed a company to construct an electric line in this city, which will be about ten miles in length. A franchise has been requested from the local authorities.

Lancaster, Pa.—An electric railway between this city and new Holland, a distance of fourteen miles, is prejected by the Conestoga Traction Company.

Projected by the Conestoga Traction Company.

Norristown, Pa.—The Doylestown Bailway Company has filed plans for an extension of its road, by which there will be a continuous line from Easton to Philadelphia passing through Hatboro, Hartaville, Hillside, Athington, Genside and Weldon. W. Jenks Fell is president, and W. C. Byan secretary of the company.

Philadelphia, Pa.—Estimates are soon to be taken on construction materials and other work for the construction of a trolley line, and necessary power house and other buildings, which will be erected by the Lower Marion & Conshohocken Railroad Company. It is to start in West Philadelphia.

Rochdale, Mass.—This town hopes soon to be connected with Worcester by a direct electric line. The project is favorable, and there will be no trouble in getting the necessary franchise.

Siloam Springs, Ark.—The city council has granted a franchise to Col. E P. Watson to build and operate a street railway in this city.

Springfield, O.—Howard Bateman, I. E. Ballard and P. B. Chesseldine are talking of building an electric railroad from South Charleston to this city

Stevens Point, Wis.—The newly organized Wisconsin River Valley Advancement Association is pushing a plan to build an electric road between this place and Tomahawk.

Tacoma, Wash.—The preliminary arrangements have been completed for the building of an electric railroad from Fairfax to the Carbon river mining district, a distance of nine miles. The cost is estimated at \$100,000. Work will be begun in the spring.

Wabash, Ind.—The county commissioners granted to Judge H. B. Shively, W. G. Sayre and H. C. Pettit a franchise permitting the construction of an electric railroad from the north line of the county to this city.

Windsor Locks, Conn.—George H. Dunham of New York, owner of the charter of the Springfield & Southwestern Street Railway and the Suffield & Windsor Tramway Company, says that the two roads will certainly be built next spring, that is the line between Rainbow and the State line.

#### MANUFACTURING, ETC.

Boston, Mass.—The Edison Electric Light Company Boston, Mass.—The Edison Electric Light Company lately closed a contract with Norcross Brothers for the erection of a new brick building adjoining the shops at No. 516 Atlautic avenue. The new building will contain an engine room 80 x 145 feet, in which will be installed a 50-ton crane and an engine of 3,000 horse power, with the dynamos to accompany it. It is likely that another new engine will be added the coming

year.

New York.—A large shipment of material and equipment for the Sao Paulo Electric Light & Power Company was forwarded by the Lambert & Holt steamship Buffon, which sailed for Brazilian ports January 5. The cargo consisted of 400 tons, including a 100-ton lot of piping, which is part of the \$120,000 contract recently placed with the Riter Conley Manufacturing Company of Pittsburg. The rest of the cargo was made up of engines, steam valves, steam water pipes, electrical apparatus and a miscellaneous lot of engineers' fittings and general supplies. apparatus and a misce and general supplies.

Philadelphia, Pa.—The British steamship Ping Suey left this port last week for Rotterdam, carrying a thousand tons of steel trolley rails, each forty-five feet long and weighing 1,300 pounds. The rails are to be used in equipping an electric railroad to be built in Holland on the American plan.

### MINES, ETC.

Redding, Cal.—A company composed of Eastern and San Francisco capitalists proposes to erect a large power plant on the bank of a stream in Shasta County. En-

gineer C. W. Waller states that the number of large mines now being developed and many others rapidly approaching the point where power is essential, the plant should prove a profitable investment. Electricity may be conducted to this and other places for lighting purposes, but first attention will be given to supplying ver to the mines.

#### COMPANY MATTERS.

Camden, N. J.—Plans are being prepared for the erection of a new electric power house to be built here by the Camden & Suburban Railway Company to cost \$15.000.

Concord, N. H.—The Lisbon Electric Light Company and the Lisbon Power Company have been consolidated and a new company organized with a capital stock of \$30,000.

Findlay, O—The Hancock Electric Light & Power Company and the Findlay Street Bailway Company have consolidated, the latter purchasing the other plant for (49,000.

Colorado Springs, Col.—The Colorado Springs Rapid Transit Company will spend \$200,000 this year. A large part of this money will be expended in the construc-tion of additional lines, while the remainder will be employed in the purchase of machinery and equip-

Denver, Col.—The Woods Investment Company of Victor has purchased the Gillette Light & Power Company's plant of this city. The new owners will abandon the generating plant next July and supply light and power on the existing wires from the big plant they are now constructing at the head of Beaver creek, nice miles ways. The current will be carried to Cempany and the contract of t nine miles away. The current will be carried to Cameron and Gillett, thence to Victor and Cripple Creek, where power will be supplied to the intervening towns and mines in the vicinity.

Greensburg, Pa —The car barns and rolling stock of the Greensburg, Jeannette & Pittsburg Electric Rail-way were recently destroyed by fire. The loss is about

Greenville, S. C.—A new power house for the Greenville Electric Street Railway will be built in the near

Holly Reach, N. J.—The Seacoast Electric Light & Holly Beach, N. J.—The Seascoast Electric Light & Power Company has sold their plant to a new company composed principally of Philadelphians. They will improve the old plant and in all probability construct a trolley road along Five Mile Beach, connecting the resorts of Anglesea, Wildwood and Holly Beach.

McKee's Rocks, Pa.—The syndicate which has recently purchased the McKee's Rocks plant, proposes to enlarge the capacity of the plant, so it will be able to supply light to Ingram and Idlewood. The Carnegie plant will be converted into a transformer station.

New Haven, Conn.—The New Haven Railroad Company will soon commence the construction of a large storage battery plant at Bristol, Conn., in connection with the New Britain third-rail system.

New York.—The plant of the United States Electric Light Company in East 24th street was recently damaged by fire.

Salt Lake City, Utah.—The Union Light & Power Company was recently absorbed by the Utah Light & Power Company, which succeeds to all of its property, interests and business.

Sherman, Tex —The Interurban Railway Company, f which J. P. Withers is president, will erect a large central power house.

Washington, D. C.—The machinery in the power house of the Potomac Electric Light & Power Company's works was recently wrecked by fire. The loss is estimated at \$50,000.

#### POWER AND TRANSMISSION PLANTS.

San Pedro, Cal.—It is reported that a large electrical plant may soon be erected here to supply power to the farmers for pumping water and other purposes.

Worcester, Mass.—The Worcester & Suburban Street Railway Company is to concentrate all its power plants, carhouses, machine and repair shops in this city. The power station will have a 2,000 horse power unit in connection with the storage batteries, which will be sufficient to furnish power for both the Spencer and Millbury divisions of the road.

#### AUTOMOBILES.

Chicago, Ill.—It is reported that Illinois men propose Calcago, 11.—It is reported that Illinois men propose to establish an automobile school, livery and cab service. The cab service plan is to contract with people by the year to take them to and from their (flices. The scheme is to be tried on Euclid avenue, and if successful will be extended to all parts of the city. It is said the company will have 100 autos in operation in the city in a shirt time if present plans are carried out.

New York.—The first auto ambulance in this country was donated by Edward Kelly to the St. Vincent's Hospital. It is operated by an electric motor supplied with power from a storage battery and cost \$3,000.—
Last week the automobile stage made its first appearance on Fifth avenue. The trial trip was satisfactory.

Miss Florence E Woods is the first woman to receive a permit from President Clausen of the Park Board, to ance on a permit from President Clausen of the operate an automobile in Central Park.

## THE TELEPHONE WORLD.

#### Active Warfare Soon to Begin.

Active warfare in New York City between the New York Telephone Company and the Telephone, Telegraph & Cable Company of America will begin in earnest within a few days, when the latter organization, through the Knickerbocker Telephone Company, its local corporation, will begin a general canvass for contracts at rates that will be about half of what the Bell Company is now charging.

what the Bell Company is now charging.

It is not likely that the Knickerbocker Company's system will be in operation for another twelve months, but every effort will be made to obtain contracts that will make the concern at once a formidable rival to the Bell. At the prices scheduled by the Knickerbocker Telephone Company, business houses will be charged \$120 and residences \$60 per year for unlimited service in the boroughs of Manhattan, Brooklyn and the Bronx, with toll charges to points outside of those districts. In Queens and Richmond the rate will be \$48 for business houses and \$36 for residences, with the option of taking service on the same basis as that offered in Manhattan, the Bronx and Brooklyn, if desired, and with tolls of about six or eight cents a message. In each case the subscribers will be connected by metallic circuit, with exclusive use of the circuit, which will give them a private and not a party line.

#### An Independent Movement.

A committee representing the independent telephone interests of Indiana, Ohio, Michigan and Pennsylvania, met in Cleveland, O., a week ago and perfected a working combination between the independent companies in the States mentioned. It is understood that each company will maintain its individuality. A clearing house will be established, similar to that of the banks, through which the various companies will do their business and balancing of accounts with one another

After the committee adjourned it issued a statement, the burden of which follows:

"Up to the present the independent telephone companies have been interchanging business within their respective States under such arrangements as seemed to meet the requirements of local business, but the volume of business has grown to such proportions, and the interchange of service between the various States has become so great that it is deemed necessary that there be a consolidation for the purpose of interchange of business between the various States interested under some general rules and regulations relative to rates and methods of handling the business as well as the construction and equipment of lines.

"Through the work of this committee the independent telephone companies of these States have effected such a combination for working purposes and interchange of business as will insure to the public every facility and as good service for local and long distance purposes as is possible to be rendered by any company or combination of interests. This committee will fix a basis for rates that will be uniform throughout the territory covered by the combination."

Meetings are being held in this city from day to day for the purpose of effecting a consolidation of the various manufacturers of telephone apparatus, which are now being operated in opposition to the Bell Telephone Company. The capital involved in the new combination, which will be known as the American Telephone Manufacturing Company, will be about \$10,000,000. The scheme is only incidental to the larger one of independent telephone service. There are at present throughout the country between 400,000 and 500,000 instru-There are at present ments operated independently of the Bell concern, and it is the manufacturers of these who will be united in the new company. One of the men interested in the deal is reported as saying that, while the combination was viewed favorably by the companies entering into it, the arrangement of details would still take some time. The new corporation will, it is said, absorb the following companies: Phoenix Telephone Company, Schmidt & Bruckner Electric Company and De Veau, of New York; Couch & Seely, of Boston, and Stromberg-Carlson Telephone Manufacturing Company, Sterling Electric Company, Victor Telephone Company, American Electric Company, Western Telephone Construction Company and Eureka Telephone Company, all of Chicago.

It is announced that Mr. James E. Keelyn has been obliged to resign the presidency of the Western Telephone Construction Company of Chicago owing to ill health, Mr. Keelyn organized this well-known independent telephone manufacturing concern in 1893, and it was principally through his efforts that the company now holds the envious position that it does.

A Minneapolis paper says: "The day of cheap telephones in Sioux City is over. The home company has been swallowed by the Iowa Telephone Company, a Bell concern, and rates will be pushed up at once. All the toll lines of the home company in the surrounding States are included in the deal. The price paid has been withheld."

#### Telephone Wires for Telegraphing.

The fact that long distance telephone lines are used simultaneously during a great portion of the time for both tele phoning and telegraphing without the slightest interruption or trouble to either system is probably realized by but very few people, even among those who patronize the long distance telephone most freely, says the N. Y. Herald.

Nevertheless, such an arrangement has been in successful operation for a considerable length of time, in connection with the long distance service.

To illustrate the value of the scheme, it may be said that a wire between New York and Chicago is leased to a brokerage firm for telegraphing. The same circuit is used by the telephone company for connecting parties between the same cities who desire to converse by long distance 'phones. As previously stated, there is not the slightest interference with either the telegraph or telephone arrangement, although both may be in use at the same moment. Even an expert cannot tell when the line is "doubled up."

For long distance telephoning two wires are always used, forming a metallic circuit. This is done to avoid the ground currents and ofttimes troublesome induction from electric light and trolley wires when the earth is used.

The "doubling up" plan can be utilized on any metallic

The "doubling up" plan can be utilized on any metallic circuit at practically no expense. The only thing required is a condenser. The latter acts as a sort of electrical accumulator. After an electrical current has passed through the tinfoll strips they retain a certain amount of electricity, which steadily oozes from one strip to another. The current thus induced is sufficient to transmit the human voice.

From each side of the telegraphic key, as used in connection with a telephone circuit, a wire is run to the condenser, which forms what may be termed a telephone "bridge."

While the key really opens and closes the main line circuit the voice of a person using the telephone travels by way of the "bridge," or condenser, at periods when the line is open at the telegraph key. In other words, by means of the induced current and condenser the voice goes around the telegraph key, which is transmitting Morse signals by breaking and closing the circuit on the main line.

This simple arrangement, which costs only a few dollars to install, makes it possible to double the earning capacity of long distance telephone wires.

Each telegraphic circuit between, say, New York and Chicago, when leased to brokers or newspapers, brings the company owning it a revenue of about \$15,000 per year. The same circuit will probably each earn double that amount in telephone tolls during the same period.

Fariners in the western part of Wood County, Michigan, have a rural telephone service in operation. The farmhouses between Grand Rapids, Weston and McClure are connected by 'phone with these towns, and the farmers enjoy the same privileges accorded town patrons of the line. No toll fees are charged to the farmers for communicating with any person in the district covered by the system, including the exchanges in the three towns. The telephone company, which is composed of business men at Grand Rapids and Weston, proposes to put a 'phone in nearly every house in the section of the county lying between these three points. The innovation promises to extend all over the county. Farmers will be thus placed in immediate communication with several markets, and if they have anything to sell they can first learn the prices offered by various dealers and then deliver to the one offering the best figure.

The Eastern Shore Telephone & Telegraph Company, referred to in last week's issue of Electricity as having been incorporated with headquarters at Denton, Md., has elected the following officers: President, H. A. Richardson, Dover; vice-president, T. L. Day, Ridgely; treasurer, Du Pont Walker, Dover; secretary, F. R. Owens, Denton. The directors are W. H. Baker, W. R. Martin, George W. Woodford, George M. Price, Jr., and Wilbur W. Hubbard. The company controls the Union Telephone Company, of which Mr. Day is president, the Cecil county telephone lines and 27 miles of telephone lines in Dorchester county. Mr. Richardson, the president of the new concern, is also president of the Diamond State Telephone Company. The new company is limited to a term of 40 years. Its capital stock, as stated last week, is \$100,000.

The Whitney syndicate which recently purchased all of the independent telephone companies in Westchester County, N. Y., is now engaged in connecting the lines in the various cities and towns. Wires are being strung between New Rochelle and Mamaroneck along the tracks of the New York, New Haven and Hartford Railroad.

The Police Board of Poughkeepsie, N. Y., has adopted a telephone call system. When the system is completed there will be twenty-four telephones scattered throughout that city all connecting with police headquarters.

#### Signs for Toll-Line Stations.

The American Electric Telephone Company, Chicago, is sending out several thousand of its very appropriately designed toll-station signs. The illustration shows a standard

design. The lettering is, of course, susceptible of adaptation to the requirements of each individual company, while the sign itself is handsome and attractive.

#### General Reduction of Rates

The new schedule of long-distance call rates for Springfield, Mass., which was announced some time ago by the New England Telephone Company, went into effect at midnight on December 31. There is a general reduction of longdistance rates of about 30 per cent. Along with it, however, says the Springfield Republican, goes a reduction of the time limit, which may cause some doubt as to the value of the concessions which the schedule embodies. A careful comparson of the new rates with the old show that those who use the telephones for long conversations are sufferers by the socalled concessions. Up to seven minutes the new rates are lower than the old, while above that the new rates make tele-phoning much more expensive than before. This difference in favor of the old rate increases with the length of conversation. This result comes from the reduction of the minimum time limit, which is now three minutes, whereas it was five under the old schedule. Under the new schedule a subwhich to close his conversation after notice by the operator, while under the old schedule he was allowed 80 seconds.

General Greely, of the Signal Corps, has just shipped to and Francisco \$50,000 worth of material to be used in establishing the army telephone and telegraph lines in the Philippines. The material will be sent on the first transports that sail, which will be early in this month. The shipment will consist of miles of wire, telegraph and telephone instruments, batteries and other things which go to make up a complete equipment for telegraph and telephone stations. The material will reach Manila early in March, and Col. James Allen, who is in charge of the Signal Corps in the Philippines, will proceed to perfect a system of communication.

The Bell Telephone Company will, it is said, build a new line of wires through Webster Groves and Kirkwood, Mo., as soon as the franchises can be obtained, and will inaugurate a telephone system in the suburban towns with Webster as the central station. It is rumored that the Kinloch Company will extend its service through this district within the next month.

The directors of the Rensselaer Telephone & Telegraph Company, which was incorporated at Albany, N. Y., on the 30th ult.. are: John H. Gleason, Edward F. Murray, John J. Smith, E. E. Summy and Charles Mahoney of Troy, N. Y.

#### TELEPHONE INCORPORATION.

The Telephone, Telegraph & Cable Company of Eastern New York. To operate in Suffolk, Nassau, Queens, Kings, Westchester, Putnam, Dutchess, Columbia, Rensselaer, Saratoga, Washington, Warren, Essex. Clinton, Franklin, Schenectady, Albany, Greene, Ulster, Orange, Rockland, Richmond and New York counties. Capital stock, \$10,000, Incorporators: William H. Eckert, Walter W. Perkins, Arthur Phillips, William S. Eckert and Frank B. Hall, of New York City, and George W. Synder and John D. Stauffer, of Philadelphia.

## **ECTRICA** SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

#### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 164@17e.; Lake, 17@174e.; casing, 164@164e.

A decree of foreclosure has been entered against the Carbondale (Pa.) Traction Company on \$450,000 mortgage bonds.

The South Side Elevated Railroad, Chicago, carried 22 627,810 passengers in 1899, an increase over I898 of 19 7 per cent.

It is stated that the Chicago Edison Company will issue on February 1 the \$1,000,000 new stock authorized some time ago.

It is rumored that the Philadelphia Electric management has practically decided to declare a dividend on the stock in February.

Production of refined copper by the lake mines in 1898 was 157,835,729 pounds. The estimate of 1899 production is 157,500,600 pounds.

The Madison Gas & Electric Company of Madison, Wis., has declared a dividend of 2½ per cent., payable January 20 to stock of record January 10.

The Washington Electric Vehicle Company, incorporated last May in Trenton, N. J., filed papers last Friday decreasing its capital stock from \$6,000,000 to \$1,250,-000

The Pacific Coast Telephone Companies made a net gain of 2,218 subscribers in December and had in operation on December 31st 64.538 instruments. The net gain for the year was 19.552.

The New Paltz & Walkill Valley Electric Railroad operating in this State has been sold at auction under foreclosure of the mortgage securing bonds issued for the construction of the line.

The National Gramophone Corporation has declared its regular monthly dividend of 1 per cent., payable January 16. Books closed January 6 and reopen January 17.

The New York & New Jersey Telephone Company has declared a quarterly dividend of 1½ per cent. and an extra dividend of 1 per cent., payable January 15 to stock holders of record January 5.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 21/625; New York Electric Vehicle Transportation, 11@114; New Elegland Transportation, 64%7.

The New Haven Electric Company at d the Bridgeport Electric Company have been absorbed by a new corporation, the New Haven Illuminating Company. The latter will issue \$1.00,000 in stock to cover purchase.

Gross earnings of the Metropolitan Street Railway Company (New York) for the month of December, were \$1.268.54!—whead of December, 1898, by \$164,389; from July 1 gross aggregates \$7,140.614, a comparative increase of \$948,667.

Exports of manufactures from the United States for the calendar year 1897 were \$279,652.00, and in 1899 \$3.7 925.00. For eleven months of 1899 to December 1 the total is \$344,88,000—indicating for the full year, approximately, \$389,000,000, an increase of 23 per cent.

The N w York State Railroad Commissioners have consented to the assuance by the Coney Island & Brooklyn Railroad Company of \$200,000 mortgage bonds. The bonds are to be issued under a mortgage dated May 20, 1898, under which but \$890,000 bonds were issued at the time.

The directors of the People's Tramway Company of Killingly, Conn., have authorized an issue of \$600,000 thirty year five per cent. first mortgage bonds, of which \$200,000 are to be put out by the Colonial Trust Company of Waterbury. Later reports go to confirm the acquirement of control of the property by the New Haven Railread Company.

Stockho'ders of the Consolidated Traction Company of Jersey City will receive, on January 15, a dividend of two per cent, which the directors declared at a meeting held in Jersey City last week, on the capital stock of \$15,000,000. The dividend will be paid out of \$300,000 which the company received from the North Jersey Street Railway Company, which has leased the Consolidated's plant

On January 8 the Mayor of New York City signed the resolution of the Municipal Assembly granting franchises to the Metropolitan Street Railway Company and the Third Avenue Railread Company for extension of their present lines north along Broadway, Eleventh avenue and Kirgsbridge road to the city limits. The franchises will not have to be sold at auction, because they are extensions of existing roads. The grant is for twenty five years, with compensation to the city at the rate of four, six, eight and ten per cent. of gress receipts.

The gross earnings of the Chicago Union Traction Company for December were \$621,614, an increase of \$33.635 over the earnings of the North and West Chicago systems in the same month of IS98. Of this increase, \$22,958 was derived from the West Chicago lines and \$10,677 from North Chicago. The total earnings of the Union Traction for the half year it has operated the North and West Chicago systems are \$3.868.666, an increase of \$262,782, or a fraction above 7 per cent. over earnings in the same period of IS98.

The Consolidated Gas Company of New York City has acquired the controlling interest in the New York Gas & Electric Light, Heat & Power Company. The xact basis on which the Consolidated bonds will be exchanged for the other company's stock has not yet been determined. The authorized capital stock of the New York Gas & Electric Light, Heat & Power Company is \$36,000.000, and it is supposed that most of this is curstanding. It is believed that \$5,000.000 of the Consolidated Gas bonds will be more than ample to acquire a controlling in erest in the New York Gas & Electric Light, Heat & Power Company's stock.

with a capital of \$16 000,000 the Consolidated Railway E actric Light & Equipment Company was incorporated on January 7 at Trenton, N. J. The company is empowered to make use of electric light and power and also to manufacture gas. The incorporators are William W. White, New York; Frank C. Rowley. Booklyn, and Walter C. Butler, West Orange. The object of the company is to combine the various concerns now engaged in the electric ard gas lighting of steam and electric cars. In time it is understood that the Pintsch Light Company will become part of the new combination.

A million dollar mortgage, given by the Utica Electric Light and Power Company to the Trust Company of America was filed with the Obeida. N.Y., county clerk recently. After the consolidation of the Utica Electric Light Company, the the Utica Electrical Manufacturing & Supply Company and the Trenton Falls Electric Light & Power Company into the Utica Electric Light & Power Company, it was decided to issue first mortgage five percent sinking fund 50 year gold honds of \$1,000 each, payable January 1, 1959. Only \$1,000,000 of the bonds have been issued. There was also filed a mortgage, given by the Clinton Electric Company to the Kings County Trust Company of Brooklyn for \$50,000 each; gas percent interest and payable December 15, 1919. The mortgage was given to secure first mortgage bonds of \$1,000 each,

### EDITORIAL NOTES.

Too Much Stock and Too Much Manipulation.

The sudden drop, just before the holidays, in the value of the securities listed on the New York Stock Exchange, and to

which we referred in a shortarticle in our issue of December 20, has elicited an interesting article from the Philadelphia "Manufacturer," which appears in the January 1 issue of that journal. After referring to the fact that the sudden decline was brought about through the reverses met by the British in South Africa and to a stringency in the local money market, and that the prosperity of the country generally was not affected in the least, the article referred to says:

"The situation is every bit as healthy as it was, and in most manufacturing industries the position of the companies is becoming better all the time, as not a few are just beginning to get into the work which was taken at the higher price level. As for the railroads, they are the servitors of industry. They catch freights going to and coming from the busy mills. They reap benefits from the prosperity of the people, both in passenger and goods accounts, and they are getting higher rates for traffic, which will assuredly increase the income and general strength of the properties. There may be a few companies which intended to pay dividends by selling stock that they still held in their safes. Such as these will not be pleased at the outlook, but the sooner they are out of the way the better it will be for everybody concerned."

In other words, our contemporary takes the stand that we always have, that a concern that is obliged to add water to its stock in order to pay a dividend, is far better out of business than in, and it might be added that the securities of such a concern have no business to be listed on any reputable exchange. The principal cause of the trouble is aptly summed up in the following paragraph:

"We all know, and attention has been called to the fact again and again in the newspapers, this one among them, that the development has been going forward too rapidly. Too much stock was being issued. There was too much manipulation in the share markets and prices were being realized for many securities far out of proportion to their value. Plants were brought together which were passé and obsolete. Property was valued at \$30,000,000 which was only worth \$10,000,000, and although the public was in some cases on its guard and was only paying the price of \$10,000,000 for the stock, in other cases there was eager buying on a much higher scale of valuation. These stocks, as might be expected, were the first to suffer. Those which had risen most rapidly and the farthest, exhibited the same symptoms when the start was made in the other direction. The conditions in this respect were not healthy, and the market has been hyper-sensitive on this account ever since the present financial movement in the industrial world first began. There comes a time, as every chemist knows, when a thing absorbs all it can take in. It reaches the point of satiety. So with the investment market. The people had got full of stocks. All the money available for this purpose was placed, and trouble was not far away. Deaths of leaders in politics or finance, famines, or other disorders, which are of a very slight or indirect bearing upon the market, were liable to produce sudden and marked fluctuations in value."

And that was just what occurred in December and that will occur again. Trusts have been organized in every conceivable line of industry and without the least excuse for their existence. The stock of amalgamated companies has been increased far beyond the value of the assets, with the result that there are numerous financial bubbles floating about today that will some time burst and cause widespread panic and financial disaster. Fortunately, most of the banks are extremely conservative so far as loaning money on industrial securities is concerned, so that when the crash does come, as it inevitably will, the principal sufferers will be the speculative public, who, in spite of ample warning, continue, as our contemporary once said, to bite at red rags.

\* \* \*

Incandescent Lamps. In a recent lecture before the Brooklyn Institute of Arts and Sciences Mr. William S. Barstow, well

known to the electrical fraternity, discussed the incandescent lamp and gave among other things some interesting statistics as to the growth of this branch of industry. During the talk Mr. Barstow showed various types of lamps and filaments and explained in a general way their method of manufacture. Referring to the methods of lighting now generally in

vogue in large communities, Mr. Barstow said:

"In large cities we know of two distributed methods of illumination—gas and electricity. In the gas business the quality of light depends upon the quality of gas, the 'tip' only controlling the quantity. In electric light the quality of the light is dependent mainly upon the burner; that is, the lamp. Hence, what is good practice in the gas business is often entirely wrong in the electric light industry. Unlike the gas light, the consumers control to a large extent the performance of the lamps in their premises, the central station simply keeping the energy at a constant pressure."

The speaker then commented on the growth of the incandescent lamp industry in this country as follows:

"The incandescent lamp is now in its twentieth year, and from its beginning, at Menlo Park, the progress has been rapid, until at the present day the total production in the United States alone is about 20,000,000 per year, and the different varieties and forms in which the lamp appears number over 147,000. From a few hundred dollars during the first year, the amount expended for lamps has annually increased, until during the past twelve months there will have been expended about \$4,500,000. The price of the lamp itself has been reduced from \$1 to an average of 18 cents per lamp, and even at this low figure the profit is quite as much as in the early days."

The fact that the manufacturer reaps as large a profit now with lamps selling at about 18 cents as in the early days of incandescent · lighting when the Edison lamp sold for \$1 is readily explained in the improvements of manufacture that have gradually been inaugurated. And yet, although improvement after improvement has been made in the method of manufacturing the incandescent lamp, until it sells for one-fifth less to-day than what it did eighteen years ago, the efficiency of the lamp in its present shape is but three times that of the lamp of twenty years ago. In other words, the improvement in the lamp itself would scarcely seem to have kept pace with its method of manufacture. In his lecture Mr. Barstow said:

"Yet, during all this advance of twenty years, the shape or principle upon which the lamp is manufactured has remained the same. While revolution after revolution has occurred in the electrical engineering field, the incandescent lamp to all intents and purposes has held its own, and to-day the vacuum lamp is the only type in general use."

That this type of lamp has, as Mr. Barstow states, held its own is due to the fact that in the past fifth of a century no better lamp has been brought out, but that there is room for improvement may be inferred from the fact that but a small fraction of one per cent, of the power liberated from coal or derived from running water is converted into luminous energy or light. Whether the Nernst lamp will ultimately prove the illuminating medium of the near future, as some seem to think, remains of course to be seen. Mr. Barstow referred to it in the following words:

"This lamp is of exceedingly high efficiency, almost twice that of the present lamp. Its main difficulty at present is the fact that some outside method of heating the incandescent portion must be used before it becomes a conductor. Within the last few months a thermostat socket has been used which causes the current, when the lamp is first turned on, to flow through a small coil of wire placed beneath the incandescent material, and as soon as this

material becomes heated and becomes a conductor, the coil of wire is cut out of the circuit What the outcome of this lamp will be it is hard to state, but for the immediate future the present form of lamp will continue to furnish electric light in its incandescent form."

\* \* \*

No Need of a
"Telephone Bill"
This Year.

At every session of the New York Legislature for the past half dozen years there has been introduced one or more

telephone bills looking to the reduction of telephone rates in New York City. These bills, which have appeared as regularly as the Legislature has met, have been as regularly killed or relegated to the so-called "Committee on Cold Corpses,"

So far this year, to the best of our knowledge, no such telephone bill has been introduced into the Legislature now in session at Albany, and truth to tell there would seem little need for such a measure. As we have several times stated in these columns, relief from high telephone rates, would in all probability, be brought about through healthy competition and not by a drastic legislative measure, and the present condition of affairs in the telephone field in this city would seem to bear us out in our original opinion.

The Telephone, Telegraph & Cable Company of America, through the Knickerbocker Telephone Company, which latter organization bears much the same relation to the former that the New York Telephone Company bears to the American Telephone & Telegraph Company, is making active preparations to furnish the residents of this city with a first-class independent service at reasonable rates. Referring to this subject recently, Col. William H. Eckert, president of the new independent company, is reported as saying:

"We will charge for unlimited service in the boroughs of Manhattan, The Bronx and Brooklyn \$120 flat for business offices and \$60 a year for residences. In the boroughs of Queens and Richmond we will charge business houses \$48 and residences \$36 for unlimited service in certain districts, with toll charges for points outside those districts, and the option of taking an unlimited service on the same basis as that offered in Manhattan, the Bronx and Brooklyn. With the lower rate a man living at Flushing, for example, could telephone at will in Flushing, but there would be toll charges to points outside of that place. The basis of tolls in Queens and Richmond will be about six or eight cents a message at the outside, as compared with the Bell company's charges of 15 cents.

"We are now actively at work laying our cables in the conduits. In Manhattan we are using the ducts of the Empire City Subway Company. In Brooklyn we will have our own ducts. Within a few days I expect we will have about four miles of cables laid, and perhaps we will be able to send, experimentally, the first independent message in this city. We are equipping as a main central exchange the building at 416 Broome street, and are also equipping another exchange on East Twentythird street, between Fourth and Lexington avenues. There will ultimately be, perhaps, twenty exchanges in Manhattan and Brooklyn. We have not yet begun canvassing for subscribers, but will do so at once. We won't charge for our telephones until we have wellequipped exchanges in operation and a large number of subscribers; probably we won't charge until we have at least 5,000 instruments in operation."

The apparatus that will be made use of by the Knickerbocker Telephone Company is covered by patents that in no way infringe on those owned by the Bell monopoly, so that no trouble need be apprehended on that score. It is also safe to say that one of the chief stumbling blocks encountered by other independent companies who have tried in vain in the past to compete with the local Bell concern, namely, no long-distance service, will be removed through the efforts of the Telephone, Telegraph & Cable Company of America, which is rapidly arranging for long-distance independent service to innumerable points throughout the country.

That it will take some time to install the necessary exchange apparatus and run the cables there is no doubt, but Col. Eckert expects the independent system to be in working order in from six to nine months, when the reasonable rates asked, about one-half those charged by the Bell concern, should insure the Knickerbocker Telephone Company a large and appreciative number of subscribers.

#### UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

WE are pleased to be able to announce authoritatively that notwithstanding rumors to the contrary the Wagner Electric Manufacturing Company's stock holdings have not been disposed of to any of its Eastern competitors. A detailed account of the annual meeting recently held by this company will be found elsewhere in this issue.

AFTER innumerable and protracted delays it now looks as though the residents of New York City are destined in the near future to enjoy real rapid transit, as bids looking to the construction of the underground system have just been opened, and providing of course no unlooked for hitch occurs at least a section of the line should be in operation in the course of a couple of years. Two bids were received from responsible contractors, one of \$35,000,000, the other of \$39,300,000. It is rumored that Vanderbilt interests are back of one of the bidders and Whitney interests back of the other.

The Delaware, Lackawanna & Western Railroad has equipped sixteen locomotives with electric headlights. Several were put in service on Monday. The Lackawanna is the first Eastern road to use this style of light. Storage batteries furnish the necessary power.

The Cascade tunnel of the Great Northern, one of the great railroad tunnels of the West, is rapidly nearing completion. The tunnel will be 13,253 feet in length, and its cost will exceed \$3,000,000. This tunnel has been excavated at a point where the Cascade range is the highest, and the distance from the roof of the tunnel to the pinnacle of the mountain through which it runs is 2,300 feet. When the tunnel is turned over to the railroad company, which it is expected will be in October next, the cars that will run through it will be operated by electricity.

SEVERAL schemes are now under consideration for the erection of new electrical works in Mexico. Two capitalists in the City of Mexico have applied to the State Government for a concession to establish two electric light plants there. The Topo Chico Street Railway, in the

City of Monterey, is being extended to the Mexican International Railroad depot, a distance of three miles. The street railway in Morelia is to be extended two miles. The San Luis Potosi Street Railway, which is at present a horse road, will soon be converted into an electrically-equipped line. The major portion of the material and equipment for the construction of all these enterprises will be purchased in the United States.

A COUPLE of Western inventors have recently brought out an electrically-operated railway crossing gate, which is said to be simple in operation, durable, and what is even more important, reliable.

PREPARATIONS are rapidly being made for holding the automobile show in Madison Square Garden, New York, next week. It is understood that a number of the largest automobile manufacturers in the country have taken space, and that many types of electrically-propelled vehicles will be on exhibition.

A RESIDENT of Syracuse, N. Y., is said to have invented and patented in the United States and foreign countries an improved apparatus for detecting a "break," or "ground" in a telephone, telegraph or electric light wire. The device as nearly as can be ascertained consists of a telephone receiver connected to the line, and of a graduated scale, the break apparently being located by means of resistances, in a somewhat similar way to the break in an ocean cable.

The Calcutta Tramways Company, Limited, which at present operates a single-track horse tramway in Calcutta, India, has, after protracted delays, received the necessary consent from the Bengal Government to run a double line, and to convert the road into electrical power. The new line will run from the heart of the city directly to the docks. The cost of the electrical equipment is estimated to exceed \$1,750,000. The bulk of the necessary material and apparatus will, it is understood, be purchased in this country.

The new United States cruiser Albany, formerly the Brazilian cruiser Admiral Abrouall, bought by this Government just before the beginning of the war with Spain, was given an official trial off Newcastle, England, last week. The test was most successful, the Albany averaging 19.54 knots per hour. A feature of this vessel is the searchlights, the reflectors of which are of metal instead of glass, made by a method devised by Mr. Cowper-Coles, and described in the issue of ELECTRICITY of March 2, 1898.

THERE are about fifty women in the United States, says the N. Y. "Commercial," who have taken a full or partial course in electricity, and are delving into the intricacies of the science for a living. The electric plants at Ellenville, N. Y., Bay City, Mich., and Saginaw, Mich., are run by women. There is one factory in New York that employs 300 women in making electrical goods. The large factory at Schenectady, N. Y., employs several hundred girls. Some are mere mechanical specialists, working day by day on the same part of electrical machinery, while many are well versed in the science of electricity and fill important positions in the factory. The best-informed woman in the world in regard to electricity is said to be Mrs. Bertha Ayrton, of London, wife of Prof. W. E. Ayrton, the noted electrical authority. She is distinctly a scientist, and her discoveries are recognized as being of great value. Miss Bertha Lamme of Pittsburg, is well known as an electrical engineer of high standing. She is on the staff of engineers of the Westinghouse Manufacturing Company of Pittsburg. Dr. Margaret Cleaves, formerly of Iowa, but now of New York, has won renown by her knowledge of electricity as a curative agent.

A RESIDENT of Brooklyn, N. Y., has invented a so-called serpentine boat by means of which he fondly expects to be able to cross the Atlantic in three days. The outside of the vessel is cigar-shaped and resembles an Archimedean screw, and is supposed to be driven through the water in much the same way that a revolving handle corkscrew pulls a cork. The nature of the power to be used in turning the vessel is not made public.

The defective insulation of an electric light wire resulted in the ignition of some woodwork in a Hillsdale, Mich., factory a short time ago. One of the employes threw a pailful of water on the blaze to extinguish it. The strong electric current passed through the connection made by the stream of water between the wire and the man holding the pail, giving him a shock that knocked him down.

ELECTRICITY is beginning to play an important part in church decoration, for at the present time there are at least two places of worship in New York City that have crosses that are electrically illuminated at night.

A NEW use has been found for electricity in the preservation of meat. It has been known for ages that meat could be preserved almost indefinitely by completely drying it, and meat so preserved has been in use in many countries. In America this product is known as pemmican, in the Argentine and most of South America as tasajo, in Chili as charki, in Africa as biltong, and by the Arabs as kilia. A chemist, says a daily paper, has discovered that electricity can replace the sun, besides being more effective. He exposed meat to the action of an electric current, and at the same time to a current of hot air. The meat was by this process welldesiccated. Not only this, but the electrically prepared pemmican is easily powdered, and is much more brittle than that prepared by any other method, making it better to pack and more handy for transportation. The electrical pemmican also has none of the disagreeable flavor which is a standing objection to most all of the other forms of its preparation. There is no reason why it should not form an agreeable substitute for canned beef for army rations.

The use of electricity is becoming more appreciated in almost every walk of life, remarks the London "Electrical Engineer." For instance, a man was recently arrested charged with being found on the roof of a jeweller's shop, for the purpose of committing a felony. On being searched, besides some some very fine specimens of housebreaking implements, there was also found a portable electric light set. This we should suppose was a great improvement on the usual means of lighting by members of this profession, comments our contemporary, owing to the ease with which it could be switched on and off, and the entire absence of smell.

The spectacle of men and women flying over the roofs of tenements to escape fires caused by the explosion of gas meters has become common in the neighborhood of upper Second avenue, New York City. The tenth recent fire of such origin occurred early Friday morning, and several tenants barely saved their lives. The officials of the Fire Department, inspectors of gas meters and employes of gas companies declare that they will exert their energies to furnish a remedy.

A BILL has been introduced into the Legislature at Albany providing for the placing under ground of electrical wires or conductors in New York City. If the owners or operators of any electrical conductors refuse to remove their poles, wires or other electrical conductors within the time limited by the Commissioner of Public Buildings, Lighting and Supplies, the said commissioner shall cause them to be removed and the expense of such removal shall be borne by the respective owners. The act, however, shall not affect any elevated railroad operated by electric power.

Nowhere have Signor Marconi's successful experiments with wireless telegraphy attracted more attention than in Germany, and soon after his work in this country during the international yacht races was completed the semi-official announcement was made in Berlin that similar experiments would be made in Germany in the near future. These tests have just taken place on the steamship Prince Sigismund and on a land station, which was erected at Laboe, near the entrance of the Kiel harbor. The tests were conducted under the auspices of the German Naval Society, and are said to have proved entirely satisfactory.

The results of the experiments recently conducted by MM. Jean and Louis Lecarme to determine the practicability of space telegraphy between two points of different altitudes, with the consequent difference in atmospheric pressure, have been presented to the Paris Academy of Sciences. The region chosen was that of the Alps, and the transmission was carried on between Chamouni and Mount Blanc. The transmitting station was established at the substation of the observatory of Vallot, at Chamouni, having an altitude of 3,000 ft., the receiving station being installed at another substation of the observatory on Mount Blanc; this point is at an altitude of 13,800 ft., thus giving a difference of level of 10,800 ft. between the two stations, which were about seven miles apart. The soil between these two points, says "Industries and Iron," London, is covered with ice, except at the part immediately surrounding the stations. The information obtained by these experiments may be summed up as follows: 1. The signals were very clear under the conditions named, with a distance of oscillator spheres equal to one inch. 2. The absence of water in the liquid state did not prevent communication. 3. The presence of clouds between the stations had no effect upon the signals. 4. The atmospheric electricity could not, on the whole, be said to have had an injurious effect upon the practical transmission of signals. 5. Another point observed was the action of the three-phase, 2.500 volt electric lighting system at Chamouni, which had a decided effect upon the apparatus, and it was impossible to work while the station was in operation.

#### THE FUTURE OF ELECTRIC ILLU-MINATION.

BY JEAN WETMORE.

#### PART III.

The wrong tendencies of Underwriters' rules and lack of backbone on the part of insulated wire manufacturers have not been the only ills that electric illumination has fallen heir to, or the only causes of expensive and involved construction.

The lowering of the grade of these necessary adjuncts called for more complicated and expensive additions as supernumeraries to guard against the evils that resulted. The cure was found in the old homeopathic maxim, similia similibus; thus another evil was indicated to counteract the first cure. Poison with poison that was the idea, for when the degenerate insulations failed to insulate it was found an expensive and troublesome undertaking to repair them, so the birth of another idea occurred as a nightmare to cheap construction—it was an asphalted paper tube to be buried in the walls. The architects became enthusiastic over the idea of being able to replace defective insulation with little trouble, as well as to be able to draw in wires at any time after the completion of a building. Such constructions possessed the additional advantage of wiring suburban structures at a future time when there should be an extension of the electric mains.

The manufacturers of this new product claimed that their paper tubes were sufficient insulation of themselves, and that simple cotton covered wires and even bare wires could be used in this wonderful tube with absolute safety. These tubes were fireproof, of course, and salesmen made demonstrations that convinced the unsophisticated; but one of the foremost installations, the Edison Building on Broad street in this city, had its paper tube conduits burned out through imperfectly insulated wires and the fire was carried from floor to floor as through an elevator shaft, and thus the city came nearly losing another one of its fire-proof structures.

These tubes were claimed to be waterproof, but it was early discovered in a Pittsburg building that water soaked them through and through, and when the old wires were withdrawn the tubes pulled apart and the patience of a Job could not thread new ones through them again.

These conduits we loudly heralded as proof against lime, and yet an installation in the Edison station at Milwaukee soon proved that vestiges of them only remained when the plaster was removed.

They were also claimed to be rat and mice proof, but these animals found them, when seeking runaways, easier to destroy than the concrete and iron construction.

It was also found that moisture condensed within, when the warm atmosphere circulated through them from without.

So defective were they found at last that the promoters of these shams finally declared that bare and cotton covered wires could not be recommended as at first proposed, and two wires in one duct were prohibited, while the best insulation was declared to be none too good for the contained wires in these highly vaunted acid, rat, moisture and lime-proof cure-alls, for cheaply insulated conductor diseases, and so rubber insulation became again in use, but at this junction, after the hard competitive struggle for recognition, aided by the undiscrimina-

ting Underwriters' rules, there were no longer any best insulated wires.

Soon these tubes were discovered to be of little protection to the contained wires from the hammer, nails and saws of the workmen, so another "improvement" was made by wrapping an "armor" of thin metal about the tubes; but still nails, hammers and saws encountered no perceptible difficulties in producing mechanical injury, so another improvement was inaugurated by drawing the tubes through heavy gas piping: thus the cost of installations was further increased and the equipment of buildings with electric lights became more of an expensive luxury, and the "lag" when alternating currents were used came to be considered detrimental.

At this stage these ideas became so serious that some sensible electricians proposed to do away with paper tubes entirely, by placing the insulation where they considered it belonged, around and on the wire directly and to make it of durable high grade quality and then use plain iron pipes for the sole purpose of mechanical protection.

There have been no class of people so stubborn to electrical common sense construction and so readily carried away with foolish and expensive innovations as architects and our friends in the various underwriting departments.

To their methods of protecting themselves against the poorer class of insulations and giving no advantage or protection to manufacturers of high grade materials, we owe mainly the many mistakes, failures and the great expense of electric equipments as compared with gas.

(To be continued.)

#### IS ELECTRIFICATION DUTIABLE?

#### BY HARRY L. TYLER.

From some points of view it is strange that a discussion should arise over the question "Is a current of electricity subject to tariff duty?" At the outset the question itself is baseless: for there is no such thing as a current of electricity. It is, moreover, very likely that few well-informed people think that there is such a thing. The fault is that altogether too many eccentric words have been elbowed into electrical diction. Custom is usually a good thing, but the truth is often better; and in science we should always choose the diction that expresses the truth.

In the contention between the Niagara Falls Power Company and the Ontario Power Company, any one is unfortunate that asserts that 'electricity is a thing that can be measured as accurately as potatoes, wheat, cloth and the like." Electricity is a science—the science that treats of electrification. Electric things are operated with electrification, and not with electricity. It is true that electrification can be measured as accurately as can anything that is measured in degree; but the mentioning of substance, which is always measured in quantity (potatoes, wheat and the like) makes a contrast—not a comparison. Electrification does not involve the addition, the removal nor the transportation of substance. Electrification consists in a conditional change in whatever substance is affected. Electrification is induced--not manufactured.

What is the Ontario Power Company doing? It is electrifying (inducing a condition in) substances that are in the United States. In no sense can the company be accused of either im-

porting or exporting. The real questions are: Should the Ontario Power Company be required to pay tribute that it would not have to pay if its generators were in this country? Should there be a law to require the owner of an electric circuit to pay tribute to whatever country his circuit might extend into, if his generator were not in that country?

There is another matter that likewise owes its confusion to the haphazard use of electrical words—i. e., the so-called "stealing of electricity." Every one with any moral sense knows that the unauthorized dissipation of electric energy is a vice. To make the act a crime, however, we should do more than enact laws; we should be careful of the diction that composes the laws.

When a person has stealthily lighted his house for a season or two at the expense of some electrical station owner, the owner can not get sentence passed upon the offender. Even the recent State laws are so weak that they are useless in that they require the victim to prove a theft-which he can never do. History shows that in the legal trial of such cases there is always a good deal of testimony and no evidence. It would be very easy to convict an offender if the laws were worded to conform to the facts, thus making it a crime to affect the energy of an electric circuit by surreptitiously placing substances in inductive juxtaposition thereto or in contact therewith. or by making use of the electrification of substances so placed.

#### Utilization of Electricity in Mining.

The introduction of electricity into mining, as a power, has become an important factor in Cripple Creek. Two central plants are now in successful operation, running hoisters, compressors, mills, samplers, lights and pumps, and a third immense plant is in process of construction. The time seems not far distant when the mines of the district will be entirely operated by electric power.

The Colorado Electric Power Company has had its plant in Canon City in operation for eighteen months. Power generated forty miles away is transmitted to Cripple Creek and distributed from two sub-stations to various clusters of mines. For the past year this company has supplied power without a moment's suspension. At present its entire 2,000 horse power is utilized by the seventy hoists, the Economic mill in Eclipse gulch, the Taylor & Brunton, Rio Grande and Cripple Creek samplers and other enterprises it is supplying. The company has orders for power for fully forty additional hoists, and as soon as possible the plant at Canon City will be enlarged to double its present capacity. This company was the pioneer in supplying electrical power and its success has attracted the attention of the electrical world. The adaptability of electricity as a motive power in mining has been thoroughly proven. No electrical drill entirely satisfactory has yet come into use in Cripple Creek, but the Lillie and Tornado mines are adapting electricity to their air compressors and so operating drills with the power on an economical basis. The oddest use of electricity in mines is in pumping, the Portland now operating a small pump in that way. The plant at Canon City represents an investment of \$350,000, and the company has found its venture highly profitable.

In August the La Belle Mill, Power & Water Company was put in operation. It is declared

by experts to be the most complete electric plant in the United States, and in addition to generating 2,000 horse power in electricity for distributing to various users, expends 1,000 horse power in operating air compressors, which send compressed air for drills to the Victor, Golden Cycle and other mines in the Moffat-Smith combination, and also to other compan-The plant entailed an investment of \$400,000. Electric power is distributed to the District Electric Railway for the running of cars, to the National sampler for crushers, and to the Gold Belt Electric Company, a branch organization which recently absorbed the Fremont Electric and Victor Lighting Companies for supplying lights to the cities of Cripple Creek, Victor, Anaconda and various mines and towns within the district. This plant and its companies were recently merged into the Denver & Southwestern Company. The plant will be enlarged during the coming year.

Manufacturers of mining machinery and supplies have for years found the Cripple Creek district their, best patron. The past year was no exception. A careful estimate of the expenditure for new mine, mill and sampler plants during 1899 shows fully \$1,500,000 added to the permanent equipment of the camp, and the demand increasing rather than diminishing as the years go by. There is not another mining camp in America that requires as many hoisting plants as Cripple Creek, there being fully 250 in constant operation. In the line of candles, giant powder, fuse, caps, steel and hammers, the camp consumes them by the trainload.

## THE APPLICATION OF THE TELEPHONE TO MINES\*

In almost every department of commercial and public use the telephone and various adaptations of its principal features have become a necessity, and yet its utility seems to have been entirely neglected so far as mining in Victoria is concerned, except in a few isolated cases. This is the more surprising, as a reliable means of speedy communication between surface and underground workings would be of vast benefit, a saving of time, which means money, and possibly on occasion a saving of life, which means more than both. But hitherto some weighty objections have barred the way. In other words, there have been some "lions in the path," representing severe conditions under which practical operations seemed almost prohibited. About two years ago the writer began a series of inquiries at Bendigo and elsewhere, and the following is a summary of the principal "lions": First and foremost, a system had to be found that, while allowing for all possible requirements, would yet be simple, and not liable to go wrong mysteriously, for any telephone system for use in a mine cannot afford a trained expert waiting around to cure electrical faults: and finally, if this ideal system proved costly to erect or maintain, then it was no good anyhow. Eventually a scheme was arrived at which promised to comply with most of the conditions, one wire only to be used, properly insulated, any number of levels to be able to "get in" to this one wire and raise surface at all times. Here "lion" No. 1 arose, thus-Each of these telephones at levels would, under usual practice, require a battery to work it; but when you come to put batteries underground in a damp and variable atmosphere, sometimes above 80 or 90 deg., it is soon found that their output will fall off or vary from time to time. Every such variation passing into a telephone while in use will set up business on its own account, to the confusion of audible speech. So at the very outset something entirely novel in the way of "circuit" or internal arrangement of apparatus within each instrument had to be performed. That such was eventually found was owing to a host of brilliant failures which preceded the final success; and yet, looking backward, a slow progression was visible in most of these apparent retrogressions.

There is evidently a law of evolution which controls invention, like most other things. However, all batteries could now be placed on surface, and "lion No. 1" had vanished. But there are few mines where mineral water is absent, and woe betide any copper conductor it touches. Corrosion, helped by electrolytic action, is the certain result to a variety of kinds of insulated wire, suspended for weeks together, in some of the worst mineral water, that could be found. They were tested before going down. and tested when they came up, with the result that a lead-covered rubber insulated wire came out best of all. It was entirely unaffected and the conductor problem was solved. Then the worst "lion" of the lot appeared. A position had to be determined on for placing the main telephone at surface, and the only proper place for it is close alongside the winding engines, within easy reach of the driver; and that is just the place where a telephone seemed impossible to operate. The din of stampers, a few yards away, perhaps, of air-compressors close alongside, together with the winding clank of gears and pump connections, seemed to render any kind of hearing a delusion.

After repeated trials it was found that the receivers, one at each ear, only required to be fitted with rubber cones or short funnels, and the surrounding noise became a distinct rumble. The remaining difficulties were soon overcome; an easy method for attaching the wire to sides of shaft was devised; porcelain insulators fixed with specially coated screens, the flexible conductor taking a half turn around each. For joining ends of leads electric light fittings were found to be just the thing-small porcelain boxes with screwed caps, technically known as "cut-outs," Under ordinary conditions a rate of erection of 600 feet per 8 hours was found possible with two men, one to carry the end past obstacles, the other to carefully lower at the reel. And it must be remembered that this successful result was arrived at largely owing to the interest taken and assistance given by Mr. W. B. Gray, of Maldon (V.), who allowed the use of apparatus at the South German mine, at Maldon, where, with the generous help of the mining manager and staff, the final experiments took place. This famous mine has now the honor of being the first to use the system for deep levels, a length of 1,600 feet having been in successful operation for some time. There remained one result which was not even hoped for, viz., a means of speaking from a hand telephone in each cage in case of anything going wrong with the haulage. This meant using the wire rope and knocker line as emergency conductors, and is only possible by a system where all batteries are concentrated at end of circuit, as in this case. For this purpose a switch is employed in enginehouse, by means of which the current can be diverted from the usual conductor and sent along the knocker lines. Then, a telephone attached to the wire rope at one side and temporarily connected to the signal line on the other becomes capable of being used, in spite of the general leakage along the sides of the shaft from the uninsulated knocker lines.

As this telephone system for mining is entirely novel, and a distinct advance on anything hitherto attempted, patent rights have been secured for the essential features, and it is in the hands of the India-Rubber, Gutta-Percha and Telegraph Works Company, Melbourne.

## MOTOR VEHICLES FOR HEAVY TRAFFIC.

The report of the judges on the recent trials at Liverpool, England, of motor vehicles for heavy traffic has been submitted to a meeting of the Liverpool Self-Propelled Traffic Association. The document, says an English contemporary, is one of exceptional interest, the trials with which it deals marking a distinct advance in this important movement. The judges, all of them engineers of eminence who have given special attention to the subject, report that the vehicles competing were generally superior to those submitted for trial last year, and had arrived at such degrees of mechanical excellence and efficiency that their use in practical trade operations would be attended with success and economy as compared with horse traction. The effective speed on set pavements was double that of horse drawn lorries carrying equal loads, and the difficulties at present experienced in ascending or descending hills were overcome by the motor wagon. The vehicles were capable of competing advantageously for the transport of loads varying from four to six and a half tons, over distances up to 40 miles, over which distance a working day of 12 hours should suffice for collection, transport and delivery. The general control, starting, steering and stopping of the vehicles, when working on the road and amongst traffic, was superior to the best types of horse-drawn vehicles. Four tons of load, carried on the legal tare of three tons at the legal speed of five miles an hour, was the maximum performance that had so far been obtained satisfactorily by a four-wheeled vehicle, but a load of seven tons could be carried if a single trailer was used. The difficulties imposed by meeting the limit of three tons tare under the Locomotives on Highways Act, 1896, were again serious drawbacks to ideal construction The judges were unanimously of opinion that the raising of the limit of tare to four tons was eminently desirable in the interests of proper economy and efficiency, and they were further of opinion that such an increase in the tare weight was for the safety of the public and in their interests. The judges hold strong views that the requirements of trade in large manufacturing and distributing centers cannot be met with the load limit of four tons, which these and the previous trials clearly indicated as the working maximum. To satisfy such requirements fully it was necessary to carry from six to ten tons on one It was clear to them that the heavy motor wagon industry could not in this country attain its legitimate proportions until the esent restrictions were modified, so as to enable manufacturers to supply vehicles capable of carrying loads of the same weight and bulk as those now drawn by horses. Self-contained vehicles capable of transporting regularly loads of from six to eight tons at from four miles an hour, and up to ten or twelve tons at reduced speeds, would shortly be available were a four ton tare sanctioned. Gold medals were awarded in two of the classes for the vehicles entered by the Steam Carriage and Wagon Company, Limited, Chiswick, while silver medals were voted to the wagons forwarded by Bayleys, Limited, Newington Causeway, London, and the Lancashire Steam Motor Company, Leyland.

<sup>\*</sup> From the Austra'in Mining Standard.

#### A GERMAN ELECTRICITY WORKS.\*

An electricity supply works has been erected in Bonn, utilizing a 2 x 220 volt three-wire system, with not only an earthed middle wire but a bare middle wire. This station, which has now been running since the middle of February, 1899, was described in detail in the Elektrotechnische Zeitschrift of December 7th. Another somewhat new feature in the distributing system is, that although the station itself is on the borders of the district supplied, a main feeding point has been chosen in a central position of the town, which is fed directly from the station by four heavy cables each of one square inch section, and from this feeding point 13 pairs of feeders radiate out to the actual feeding points on the distributing network.

Dr. Paul Bauer, who is the writer of the article, states that Bonn is the first town in Germany to adopt a 2 x 220 system of any large size, although there are several smaller systems employing 220 volt two-wire systems in that country. Since the erection of the Bonn station was started, the towns of Crefeld and Basle, Switzerland, decided to employ similar systems, and these will shortly be in operation. The expectation that the weight of copper employed would be a quarter of what was necessary on a 2 x 110 volt system was not absolutely fulfilled in practice, although of course there was a great saving. There were two reasons for this. In the first place, increasing the load in this proportion would mean that the current density in the copper would be doubled, and, especially in the case of short feeders, this would result in a current density exceeding what is generally considered permissible. In the second place, some small and lightly loaded distributing mains would, according to this calculation, have sections smaller than would be advisable from practical considerations. These points apply especially to a 2 x 220 volt system with a bare middle wire, as the bare middle wire itself cannot be greatly reduced, on account of possible electrolytic or direct chemical action upon it. Moreover, the earth currents emanating from the adoption of the middle wire would, if a great fall of pressure were allowed on it, cause disturbances to the telephones (which are on the single wire earth-return system in Germany) and cause electrolytic action in other conductors under the streets. In addition, the cost of cable does not increase in proportion to the section of copper, but at a slower rate, and the cost of cable fittings is practically the same for the two pressures. So that, taking all in all, one can reckon that the cost of a 2x 220 volt network amounts to from half to threequarters that of a 2 x 110 volt one for the same supply.

After pointing to the advantage of a 2 x 220 volt system, that the same machines can be employed both for lighting and traction (although of course not from the same 'bus bars if the full pressure is employed for the traction with an earthed return), and the disadvantage in the necessity of having so many arc lamps in series of constant pressure mains, the writer proceeds to describe the generating station, which has some points of interest. The water in Bonn cannot be employed directly in the boilers, on account of its extreme hardness, and has first to be freed of lime and carbonates. For this purpose solutions of caustic soda and quicklime are employed to precipitate the lime and carbonates respectively. The two solu-

tions are kept in separate wrought-iron vessels and they are fed automatically into the water. After this mixing in a special vessel, the filtering takes place in two cylindrical vessels with funnel-shaped bottoms, in which the precipitate collects. The vessel is so constructed that this slime can be conveniently removed from time to time. Thence the water is led to two tanks, from which it flows directly to two feed-pumps beneath. This water-softening and cleaning plant can deal with 2,640 gallons of water per hour. Steam is led to the four-throw Weise and Monski feed pumps (capacity of each 3,170 gallons per hour against a pressure of 147 lbs. per sq. in.) through wrought-iron ring mains with copper bends. The water condensed in the various steam mains is, when clean enough, allowed to flow into the feed tank; and the feed is further heated by leading the exhaust from the feed pumps through the mixing vessel into the open air. A cooling tower is employed for the circulating water of the condenser.

The boilers are two in number, by Messrs. A. Büttner, of Uerdingen, and designed for quick steam raising. Each contains 117 inclined water tubes 3.74 in. in diameter, 0.14 in. thickness, and 16 ft. 5 in. long. Each boiler is fitted with a superheater of 520 sq. ft. heating surface, consisting of a number of thin wroughtiron tubes placed in the path of the furnace gases, and through which the steam from the boiler is led to the mains. This increases the temperature of the steam by 40° to 60° C. Two different systems of "smoke-consuming" stokers have been put in, to enable a comparison to be made between them. One is by Kowitzke, of Berlin, and the other by Fröhlich, of Leipsic. In the former a sufficiency of strongly-heated air is automatically led through a cast-iron fire bridge of peculiar formation and provided with hollow spaces. This supply is regulated automatically by a stop valve controlled by gearing for a certain time after fresh fuel has been added, and in this way perfect combustion is attained. The Fröhlich stoker is briefly an inclined grate, which the fuel reaches through a hopper without the entrance of cold air. The fuel slides down the grate as it gradually burns, and finally falls into the ash-pit through a trap at the end of the grate. Above the grate is a bridge of refractory material in which are air channels, and the glowing walls of this, in conjunction with the air entering through these passages, are said also to effect complete combustion. A convenient arrangement is provided for removing the ashes. Two similar boilers are now being erected in addition to those already working.

Wrought-iron duplicate steam mains with copper bends lead to the engine room, where there are at present two vertical compound engines running condensing at 150 revolutions per minute, and with an average output of 200 hp. and a maximum of 250 hp. each. They are from Messrs. G. Kuhn, of Stuttgart, and their main dimensions are: Horse-power cylinder 18.3 in., L. P. cylinder 27 in., stroke 17.7 in. They have piston valves, and regulate by variation of the cut off in the high-pressure cylinder. The condenser pump is also of Messrs. Kuhn's construction, and is worked from the cross-head. The engines are arranged to work condensing or non-condensing. According to the guarantee, the engines are to develop 200 hp. with steam at a pressure of 132 lbs. per sq. in., using 17.2 lbs. of steam per ihp. per hour, and 17.6 lbs, of steam at the maximum load of 250 hp. A half per cent, speed variation is allowed dur-

ing one revolution. A Swiderski triple expansion engine, rated at 650 hp., is being erected.

The engines are directly connected to the dynamos, which are of the Siemens-Halske internal pole multipolar type, capable of generating 175 kw. each at a pressure of 440 to 550 volts when running at 150 revolutions per minute. A maximum temperature rise of 50° C, is guaranteed, and an efficiency of at least 90 per cent. For the Swiderski machine, a Siemens & Halske dynamo will also be provided.

The battery consists of 200 (E 23) Tudor cells, with a capacity of 540 ampere-hours at the maximum charge or discharge rate of 180 amperes, or a capacity of 700 ampere-hours at 70 amperes discharge. Four hundred amperes may, however, be taken from the battery without injury. The cells are erected in two rooms above one another, and two similar rooms above these are provided for a similar battery which will eventually be put in as a "buffer-battery" for tramway work. Thirty-eight regulating cells are provided at each end of the battery, two to each contact of the regulating switch. A combined set of balancing transformer and boosters is employed in much the same way as is done in a number of modern stations in this

The switchboard is of marble mounted on an iron framework, and is placed at a distance of 5 ft. from the wall on a platform 8 ft. 3 in. above the ground. All the fuses for the machines, battery and feeders are fixed on the wall below the platform, and shut off from the rest of the engine room by an oaken wall with a side door at the end. Here are also meters and switches controlling the pump motors. The back of the main switchboard is also accessible through a door at the end. An innovation is the insertion of bells across the resistances bridging the contacts of the battery regulating switches, so that a bell rings if the switch is left between two contacts. The station pump-motors, and station lighting are arranged so that they can be switched on to either side of the three-wire network, and thus aid in balancing the load.

The arrangement of the feeders has already been referred to. At the central feeding point is a small iron tower, similar in form to the transformer houses so common on the continent, and from here all the feeder circuits are branched off through fuses. Two ammeters are arranged with plugs to fit into contacts on either side of the fuses, so that an ammeter can be cut in and the current through the feeder measured without interrupting the circuit. Pilot wires run from the feeding points to this central switching point, and thence to the station, and there is also telephonic connection to the station, so that testing is greatly facilitated. The distance of the farthest point of the network to the station is about 2.4 miles and the whole length of streets in which cable is laid is 18 miles. At all feeding points and branching or crossing points of the network disconnection boxes are provided, but in making house connections it is unusual to disconnect, it being found that an experienced jointer can do the work while the cables are live. The network is designed for an equivalent of 8,000 16 cp. lamps, on the basis of  $2 \times 50$ volts drop of pressure from station to feeding points and 2 x 3 volts on the distributing network.

All the house connections are made as threewire connections. Up to about 20 lamps the wiring is connected to one side of the threewire network, and the service cables end in a

<sup>\*</sup> From the Electrician, London.

switch fuse which enables either outer to be connected to the wiring, the free pole remaining covered by a protecting cap. Connections of over 20 lamps two separate single-pole fuses are employed, and the circuits of the house wired on two absolutely separate circuits, one on each side of the three-wire system. No fuses or switches are connected on the middle wire. Motors over 2 hp. are connected between the outers.

When supply was started in February there were 350 consumers, and the number now exceeds 400. This is considered a large demand for the first year's working in a town of 40,000 inhabitants. No trouble has been experienced with the new system of distribution.

#### THE TELEPANTOGRAPH.

The "telepantograph," the invention of R. Greville-Williams, may be described as an electrical instrument by means of which a drawing, letter, photograph, shorthand, diagram or other graphic matter can be automatireceiving instrument will print two copies or more at the same time; and thus undisputed records of all messages are obtained and can be used for future reference. Should a large number of copies of the reproduction be required, the receiver will engrave it directly on copper, zinc, etc., instead of writing it on paper, and in this way thousands of copies can be printed from the plate. In this case the marker or the receiver is replaced by a graving tool and the paper by a sheet of metal.

The letter or drawing to be transmitted is written or drawn on a sheet with a specially prepared ink and as soon as this ink is dry the instrument may be started. When the message arrives at the receiving station it is complete. The ink made use of is a compound of gelatine and a bichromate and is covered by patents taken out several years ago in Great Britain, Germany, France, Russia, Austria and the United States.

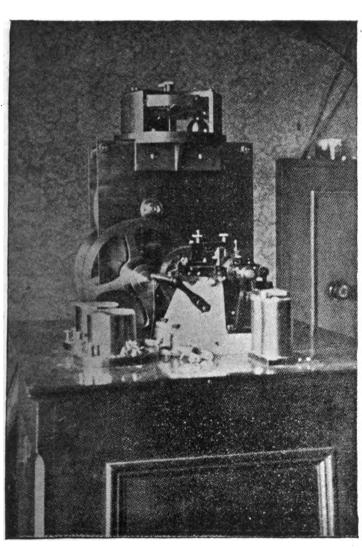

A decided advantage of the telepantograph over some of the other systems of transmitting pictures, recently brought out, is that the pro-

sages. The cost of news can be greatly reduced if telegraphing in shorthand be resorted to, for a message written on the metal sheet in shorthand is as easily transmitted as one in which words are used.3

Commenting on the field of usefulness of Mr. Greville-Williams' invention, the paper quoted above says:

"That the telepantograph will prove of great value in many different ways cannot be doubted. We have space to hint at only a few of them. The special correspondent of a newspaper will be able by its aid to send to the printing office sketches, diagrams, photographs, etc., of events happening in all parts of the world, for wherever the telegraph wire goes, there the telepantograph will find a sphere of action.

"Pictures of some great battle in Egypt, China, or any part of America could then be sent by war artists, and the reader would find in his evening paper sketches of a battle fought but a few hours before. All this seems to point to the fact that the newspaper of the

TELEPANTOGRAPH RECEIVER.

cally telegraphed to any distance to which an ordinary telegram can be sent through the medium of one wire. tions and consequently no loss of time.

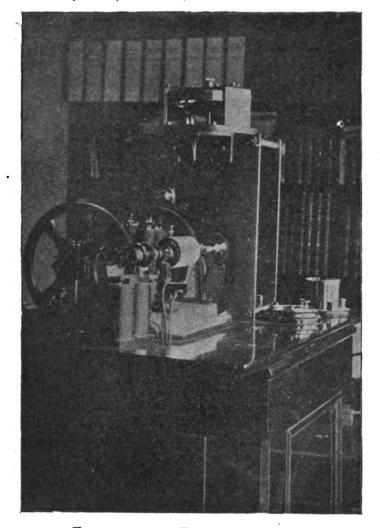

When you desire to send a message all you have to do is to write it, draw it, or have it photographed on to a thin metal sheet, and place this in the transmitter. You then simply turn a switch, and the inscription, whatever it may be-drawing, photograph or letter-is automatically recorded by the receiver at its destination on paper, wood, metal, etc., as desired.

If the message is to be received on paper, the

cess invented by R. Greville-Williams is a mechanical one, requiring no chemical manipula-

The West-End, a London publication refers to the telepantograph as follows:

We may imagine that in the future each postoffice will contain a telepantograph, which would be placed beside the ordinary telegraph instrument and switched on to the same wire used for ordinary telegraphing. On the duplex system now in use, the two machines could be worked on the one wire at the same time without in any way affecting their respective mes-

TELEPANTOGRAPH TRANSMITTER.

future will be much more profusely illustrated than is the journal of to-day; in our daily paper we shall then find photographs, sketches and pictures illustrating events that took place in all the four quarters of the globe but the day before.

"To the detective and police force the telepantograph will prove a serviceable ally, for in the event of a convict being 'required,' his counterfeit presentment could be telegraphed all over the country so that however quickly he might arrive at a port with the intention of taking ship to some foreign part, his picture

would be there before him and he would be at once recognized and captured."

As regards the practicability of this method of transmitting pictures and messages it is stated that many telegraphic experts in Eng-

PICTURE RECEIVED ON THE TELEPANTOGRAPH

land are of the opinion that with the telepantograph practical results have been produced never before obtained.

#### USE OF ELECTRICITY IN SOUTHERN IN-DUSTRIES.\*

BY SAMUEL J. SMITH, Charlotte, N. C.

One of the best things about the progress of electricity in the South is the demand for a higher standard of electrical apparatus, as the better grades are being more commonly required and the best quality of workmanship is wanted.

This is due to the fact that much costly experience has been gained in past years, by users of the cheaper and generally high speed dynamos, and inferior design in wiring and engineering construction.

The call now is for electrical apparatus of the higher grades, and wiring put in of not only good electrical design, but also of good workmanship, and closer observance of insurance rules.

Slow speed apparatus is more largely in demand, and there is some tendency to direct connected, because such sets are easier handled, saving wear and annoyance of belts, economizing floor space and giving a somewhat higher power efficiency.

Most of the dynamos of fair size and larger are now run by special engines, as this not only insures better regulation and so saving of lamps, but also provides light after the main engine has shut down.

The cotton mill is largely responsible for the higher quality of plants, as many of the mills run at night, and those of the day runs require light during a number of months, and it is absolutely necessary to have the most perfect of plants, as a shut-down of all, or even a part, of the lighting system means much loss in production and consequently money loss.

The mills during the past year, and especially the latter part, have kept the electrical men busy, putting in more modern machinery in place of the old, installing plants in new mills and correcting the wiring in old mills.

Perhaps one advance worthy of note in cotton mill lighting is the use of the arc lamp, i.e., the enclosed arc, which consists, in addition to the usual outer globe, of an inner globe or bulb in which burn the positive and negative carbons, and a life of 100 to 150 hours is thus gained for one trimming of the lamp.

This long burning quality has made the arc lamp practicable, and because of its light being nearest sunlight, it is especially useful for colored goods. The better light gives less "seconds," and poor light, as one superintendent remarked, "gives no goods at all."

There is also a more general call for motors for pumping water, or running any machinery removed from the shafting or steam lines - and this is simply in the line of greater economy and perfection.

A new thing projected this year and which will be watched with interest, is the electrically-driven mill, i.e., in which the electricity is generated from steam and then transmitted to motors at various points in the mill buildings.

There is good reason to believe that such an equipment will give not only better regulation and more uniform speed, but what is important to the mill man—an increased output with the same machinery and labor.

The tendency in plants for light and power seems to be the use of larger units, because of higher economy and being easier handled—a greater use of improvements on the steam side and more practice of system in the management of such plants.

Power circuits are being found profitable, because of the many uses for the electric motor, and the consequent upbuilding of many small industries.

Many of our railway and light plants have been consolidated and the combination gives better service to the town in which they are located, and is also more profitable to the stockholders.

The work of the past year makes it evident that there is a good investment in a light or power plant, or both, when such a plant is laid out with proper engineering design and reference to the service to be given.

Perhaps the electrical development that attracts most attention is the transmission of electricity from water power. There are a number of powers already developed in the South, now building and projected and space forbids a description of the more important, especially as these have been already described in the 2 adesman.

The transmission of electricity is limited largely by the cost of the transmitting copper lines, and the maintenance of such lines, and as high as sixty and seventy miles are in use; but for practicable commercial-use about twelve to fifteen miles is the limit, though under especially favorable circumstances twenty or even twenty-five miles might be covered.

The use of large powers is not necessarily the most profitable, as many small ones exist all over the South that could be easily and cheaply developed, and furnish power for a factory, cotton mill or other industry, and which in turn will furnish employment to the neighboring population, and this is the best possible development of a country.

There are situations where an electric railway could be operated by such power, and thus connect some isolated town or mill to a main line of railroad. When one thinks of the much hauling through winter mud, in such situations, it seems especially profitable.

An electric railway can haul freight, express and passengers cheaply under such conditions, for the power is cheap, the equipment of rolling stock is moderate in expense, and rails can be laid and routes chosen not practicable for a steam railway.

For the above reasons also an electric railway connecting good-sized towns is better than steam service, even if the power is generated by steam; for such a plant can be operated in connection with local power and lighting plants.

The most expensive part of a transmission plant is generally the water or hydraulic development, and this cost varies per horse-power very much, while the cost of the electrical part per horse power is more constant, varying only by total power.

In short, it may be said that whenever the water part can be done at a moderate cost, then by all means develop it.

In conclusion, 1899 has been a very good year for the use and practice of electricity, and much credit is due to electrical men of the South in making a higher standard of work, and it can be well said that good, representative firms can be found in several sections of the South, who can build and install up-to-date plants, based on experience and engineering training.

In the coming year there are excellent opportunities for the use of electricity in an ever widening field, and greater encouragement than ever will be given to the man who is thorough in his work and "building for the future."

If 1900 will continue the prosperity of the last of 1899, then such men will be well rewarded; and good electrical men require a training and experience that merits reward

#### American Electrical Apparatus in the Orient.

Three years ago the electrical apparatus furnished in the Orient was almost exclusively of German or English manufacture. During the last year, however, the greatest portion of the electrical apparatus furnished in the Orient has been of American manufacture, this being the case regardless of the higher prices of American machinery, the orders being placed with the American firms on account of the superiority of their product.

The Commercial Electric Company of Indianapolis, Ind., has recently furnished an electric lighting plant for the illumination of the river front of the city of Shanghai, the order being placed directly by the Chinese Government.

This company has also completed the installation of a complete lighting plant for the Japanese Government for the penitentiary at Yokohama.

Another recent installation is the complete electrical equipment of the new Government ice and refrigerator plant in the city of Manila.

## The New York Electrical Society-201st Meeting.

By courtesy of the New York & New Jersey Telephone Company, the Society will visit the company's main exchange, at 81 Willoughby street, Brooklyn, on Wednesday, January 17, at 8:30 P.M. Mr. F. O. Runyon, the engineer of the company, will deliver an address on "The Common Battery System," and describe the features of interest in the exchange. The visitors will assemble on the fifth floor. After Mr.

<sup>\*</sup>From the Chattanooga Teadesman.

Runyon's address they will be escorted in groups over the building.

The exchange is three blocks from the City Hall. Passengers on Fulton street or Myrtle avenue cars will get off at Lawrence street and walk one block to Willoughby street.

#### LONDON NOTES.

(From our London Correspondent.)

#### Standardizing Copper Conductors.

Not long since a committee was formed, consisting of representatives of the Institution of Electrical Engineers, the General Postoffice, and the principal manufacturers of rubberinsulated cables to consider the question of including copper conductors among the standardized engineering products. The committee has now issued its report. It says among other things that "the advantages of standardizing are being largely advocated for almost all classes of engineering products, but copper conductors have hitherto not been included in the list, as everyone has assumed that they were already standardized, and that Matthiessen had settled the resistance and temperature coefficient of copper in his researches nearly 40 years ago." This assumption, says the report, is far from being true, and the catálogues of various electrical cable makers, as published before 1899, show considerable discrepancies in the resistance and weight of nominally the same cables, while the Postoffice issued a specification differing from all others. To remedy this confusion the committee was appointed. It had as its chairman Sir W. H. Preece, K.C.B., F.R.S., with Messrs. Gavey and Hartnell, representing the General Postoffice; Prof. Ayrton and Messrs, Mordey and Taylor for the Institution of Electrical Engineers, and a number of cable manufacturers' representatives. Mr. A. H. Howard was secretary. The committee reports:

- 1. Resolved, That Matthiessen's standard of .153858 standard ohms resistance for a wire 1 meter long, weighing 1 gramme at 60° F., be taken as the standard for hard drawn high conductivity commercial copper.
- 2. Hard drawn copper to be defined as that which will not elongate more than 1 per cent, without fracture.
- 3. Resolved, That Matthiessen's standard of .150822 standard ohms resistance for a wire 1 meter long, weighing 1 gramme at 60 F., be taken as the standard for annealed high conductivity commercial copper.
- 4. Copper to be taken as weighing 555 lbs, per cubic foot at 60° F., which will give a specific gravity of 8,912.
- 5. Resolved, That Messrs. Clarke, Forde & Taylor's temperature coefficient, as published in their pamphlet dated February 20, 1899, be adopted, and that the average coefficient of .00238 per degree F. be adopted for commercial purposes.
- 6. Resolved, That the resistance and weight of conductors be calculated from the actual length of the wires.
- 7, Resolved, That a lay of 20 times the pitch diameter be taken as the standard for the calculation of tables.
- 8. Resolved, That 2 per cent, variation of resistance or weight be allowed in the conductors.
- 9. Resolved, That an allowance of 1 per cent. increased resistance as calculated from the diameter, be allowed on all tinned copper between Nos. 22 and 12 guage inclusive.

NOTE TO FIRST AND THIRD.

The figures inserted have been calculated for

60° F. from the figures .1469 per meter gramme for hard drawn and .1440 for annealed at 32° F. by Matthiessen's formula.

 $\frac{1 - .00215006 (t - 32) + .00000278 (t - 32)^2}{1 - .00000278 (t - 32)^2}$ 

From the above data formulæ are obtained giving the standards, but a variation of 2 per cent, in resistance or weight is allowed for losses in manufacture. The figures have been adopted by all the parties represented on the committee and the hope is expressed that they may become the universal standard for Great Britain. The Postoffice specifications are to be issued in accordance with the report and the same figures will be included in all manufacturers' catalogues, so that there is little doubt about the adoption of these standards in Great Britain.

#### Funeral of Mr. and Mrs. S Dana Greene.

The funeral services of Mr, and Mrs, S. Dana Greene, who were drowned on the evening of January 8, were held in Schenectady last Thursday. They were attended by scores of distinguished persons, including Gov. Roosevelt and his staff and Naval and National Guard officers. A special train from New York brought a detachment of the Naval Reserves and a number of prominent electrical engineers.

The bodies of Mr. and Mrs. Greene were viewed by friends in the parlor of their late home during the morning. They were in plain coffins covered with black broadcloth. In the right hand of the husband was a small picture of the wife, which Mr. Greene had carried for several years. The coffins were surrounded with flowers. A short service of prayer was conducted at the home at half past 12 o'clock, and then the bodies were escorted to St. George's Episcopal Church by Company F. Second Regiment, and a detachment of the First Naval Battalion, under Lieutenant Andrews. The Naval Reserve detachment served under Lieutenant Greene on the Yankee during the Spanish war. The services at St. George's were conducted by the Rev. Dr. J. Philip B. Pendleton and Bishop Doane, of Albany.

The pallbearers were Captain J. W. Miller, commander of the Naval Militia: Charles A. Coffin, president of the General Electric Company; Joseph P. Ord. W. L. R. Emmet. Hinsdall Parsons, Howard C. Levis, R. S. Sloan and Douglass Campbell, of New York; James Refield, of Utica: the Rev. J. Russell Stevenson, of Schenectady; C. Whitney Tillinghast, of Troy, and Arthur Clark, of Batavia.

Afterward the bodies were placed on a train bound to Bristol, R. I., where the interment took place.

The business houses of the city of Schenectady were closed during the funeral hours, and the streets through which the procession passed were jammed with spectators.

## Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended January 13:

Antwerp, 80 cases, \$6,232; Barcelona, 65 cases, \$2,797; Bremen, 210 cases, \$3,162; British East Indies, 2 cases, \$118; British Possessions in Africa, 52 cases, \$4,080; British West Indies, 11 cases, \$269; Charleroi, 1 case, \$40; Chili, 13

cases, \$29; Cuba, 228 cases, \$1,229; Dutch West Indies, 1 case, \$12; Ecuador, 1 case, \$17; Glasgow, 57 cases, \$3,967; Hamburg, 109 cases, \$9,410; Havre, 733 cases, \$76,496; Hong Kong, 1 case, \$8; Japan, 44 cases, \$4,209; Mexico, 65 cases, \$2,844; Peru, 13 cases, \$340; Philippines, 16 cases, \$5,127; Porto Rico, 7 cases, 97; Siam, 56 cases, \$893; Southampton, 20 cases, \$950; Stockholm, 1 case, \$120; U. S. Colombia, 90 cases, \$2,566.

#### BIG INCREASE'IN BUSINESS.

## The Wagner Electric Manufacturing Co. Re-elects Its Old Officers and Declares an 8 Per Cent. Dividend.

The annual meeting of the Wagner Electric Manufacturing Company, whose general offices and factory are at 2017-2023 Locust street, St. Louis, Mo., occurred January 8th. The old board of directors, as well as officers, were reelected as follows:

S. M. Dodd, president; James Campbell, vicepresident; S. B. Pike, secretary and general manager; W. A. Layman, treasurer and assistant general manager; Ferd Schwedtmann, general superintendent; E. H. Abadie, manager sales department. Directors; S. M. Dodd, James Campbell, James W. Bell, J. C. Van Blarcom, S. B. Pike, Ferd Schwedtmann and H. A. Wagner.

The reports of the officers there represented showed an increase in the company's business during 1899 as compared with 1898 of 68.5 per cent. By vote of the board a dividend of 8 per cent., payable March 10, was declared.

During the year there have been many rumors current to the effect that the majority of the stock holdings of the Wagner Company had been disposed of to some of its Eastern competitors and that the business was now fully under control of these competitors. All these rumors have been absolutely without foundation. The stock is held entirely by St. Louis parties and the officers and directors of the company are all representative St. Louis business men. The year just closed has been one of the most successful in the history of the company, being specially marked by a large number of important contracts calling for a high grade of engineering work.

### TESLA IS NOT SICK

#### And He Says He is Going to Telegraph from New York to Paris Without Wires.

Denver, Col., Jan. 14.—Nikola Tesla proposes to telegraph from New York to Paris without wires. He arrived yesterday from Colorado Springs, where he has been working secretly, and announced that he had perfected a system of wireless telegraphy vastly superior to that of Marconi. He left for New York last night.

Said Mr. Tesla: "I didn't come to Colorado for my health, but to learn the effect of dry air and high altitude upon the machine I have perfected. The benefits of my machine during a sea fight cannot be estimated. It will aid in doing deadly work.

"The beauty of my machine is that it can transmit power over several thousands of miles without wires. Now the Marconi system is useless at distances of more than one hundred miles. Any operator can read a message in transit by the Marconi system. It is impossible to do this with my machine. I expect to send messages to Paris during the Fair."

#### LEGAL NOTES.

A jury, before Justice Geigerich in the Supreme Court of New York, gave John Jacob Goetz a verdict for \$8,000 and costs against the Metropolitan Street Railway Company. Goetz was employed by the company and was injured by an explosion of compressed air at the Lenox avenue depot.

Judge Andrews has decided in favor of Charles Cohen, the Watertown, N. Y., real estate man. The Thomson-Houston International Electric Company must pay him \$8,000 and the costs of his suit. Mr. Cohen went to South Africa in 1889 as the representative of the Thomson-Houston Company, for the purpose of putting in electric street railways, lighting and mining plants. He returned in 1894 and claimed that the company had violated its contract with him by withdrawing his agency after he had worked up a large amount of business for them and had then gone on and closed up, the business themselves. reaping the fruits of his labors and refusing to allow him any compensation. He commenced suit against the company and the trial came off in Watertown in October, 1898. The jury passed upon the contract only, and the computation of the amount due was referred to W. S. Andrews. The decision allows the plaintiff damages in the sum of \$14,000, subject, however, to a counter claim by the defendants of about \$6,000.

## CANADIAN NOTES.

(From our Ottawa Correspondent,)

Mr. Howard C. Symmes, a New York electrician, has joined at Guelph, Ont., the second Canadian contingent for the war in South Africa.

The receipts of the Toronto Electric Street Railway increased from \$1,187,662 in 1898, to \$1,315,049 for last year, a gain of \$127,387. The average daily receipts increased \$349. For the month of December last the receipts amounted to nearly \$120,000 as against \$84,000 in December, 1896.

Mr. Raymond F. Prefontaine, and a number of associates will apply to the Quebec Legislature for an act to incorporate themselves as the Labrador Electric light and Power Co., to acquire and develop water power on the Murray Bay River, and to build electric railways in the counties of Charlevoix, Chicoutimi and

Messsrs. R. and W. Conroy, of Deschesnes, Que., have contracted with E. B. Eddy, of Ottawa, to deliver 2,000 electrical horse-power at the Eddy mills at Hull. Que. The contract is for a period of ten years renewable afterwards for a further time if desired. The price per horse power is \$15, making a \$30,000 yearly contract. The Conroy Bros. will put up the necessary power-house and other buildings at Deschesnes, and Mr. Eddy will use the power supplied for running his pulp mills and his other factories, at which the power was to be delivered.

The Cataract Power Company of Hamilton, Ont., is considering the extension of the radial railway system of that city to Oakville. It is also probable that the Toronto Electric Railway Company will extend its road to Oakville. thus completing an electric line between Hamilton and Toronto.

The Bell Telephone Company has just completed and opened for business a new heavy long-distance copper metallic circuit line be-

tween Ottawa, Carleton Place, Smith's Falls and Brockville, in the Province of Ontario. Work on this line was begun last May at Ottawa, and was expected to be completed in October, 1899, but owing to the quantity of rock encountered on the road, the work has been delayed a month. The company used a portable steam rock drill to drill the holes before blasting, and about 10,000 lbs. of dynamite were employed. The completion of the line required upwards of 3,500 poles, 4,000 cross-arms, and 75,000 lbs, of copper wire. This line gives Ottawa a most direct and perfect long-distance service with Buffalo, N. Y., and other western points, and a material reduction has been made in the rates to such places, as formerly business had to be carried on via Montreal to reach them. Ottawa has now direct connection with Utica. Watertown, Ogdensburg and other central New York points by telephone.

#### PERSONAL MENTION.

Mr. E. P. Sanford has been appointed manager of the Montelair (N. J.) Electric Light & Power Company.

Mr. Samuel Wilkinson has been selected city electrician for the new municipal lighting plant at Northville, Mich.

Mr. William K. McAlister, superintendent of the West Jersey & Seashore trolley line at Atlantic City, died last week at his home in that city

Mr. Jacob C. Rogers, president of the Edison Electric Illuminating Company of Boston, died recently at his home, 231 Commonwealth avenue.

Mr. George M. Kummerlein, who has been superintendent of transportation for the Milwaukee Electric Railway & Light Company, has been appointed superintendent of the company's lines in Racine, Wis.

Mr. Anthony N. Brady, formerly head of the New Amsterdam Gas Company of this city, was elected president of the New York Gas & Electric Light, Heat & Power Company last week.

Mr. W. F. White, formerly general manager of the Omaha Electric Light Company, has succeeded Mr John I. Beggs, who for six years held the office of general manager of the Cincinnati Edison Electric Light Company. Mr. Beggs will fill a similar position with the Milwaukee Electric Railway & Light Company.

## INCORPORATIONS.

The Eaton Rapids Electric Company, Eaton Rapids, Mich. Capital stock, \$10,000.

The San Francisco Electric Light & Power Company, San Francisco, Cal. Capital stock, \$1,000,000. Incorporators: W. Angus, W. H. Crocker and W. F. Pierce.

The Emerson Electric Light Company, Grand Encampment, Wyo. Capital stock, \$60,000. Incorporators: Chatterton, H. A. Frambach and Willis George Emerson, all

The Bellefontaine, Kenton & Lima Railroad Company, -to operate an electric road. Capital stock, \$100,-000. W. N. Miller, F. B. Williams and R. Dunlap are interested.

The Alabama Electric Light & Power Company, Opelika, Ala. Capital stock, \$50,000. Incorporators: H. S. Parsons, T. S. Parsons, H. C. Davidson, J. W. Parsons and J. S. Pou, all of Montgomery.

The Clarendon Electric Light & Ice Company, Clarendon, Ark. Capital stock, \$10,000. J. S. Thomas president, M. J. Manning vice-president, Ike Bondi secretary and treasurer, W. M. Graham business manager.

The Consolidated Railway, Electric Light & Equipment Company, Trenton, N. J.-to make use of electric light and power, also to manufacture gas. Capital stock, \$16,000,000, Incorporators: William W. White, New York City; Frank C. Rowley, Brooklyn, and Walter C. Butler, West Orange.

The Russell Electric Mallet Company of Frederick County, Md.-to manufacture an electric mallet to be used by dentists in driving gold fillings. Capital stock, \$10,000. Incorporators: Percy Russell, Isaac S. Russell, Louis O. Willis. Aggie R. Russell and Anna Mary Willis, all of whom are residents of New Market.

The Victor Euclasure Company, Saco. Me.—for the purpose of manufacturing and dealing in devices to produce light, heat or power from electricity. Capital stock, \$10,000. President, S. A. Bemis of Philadelphia, Pa; treasurer, Chas. F. Munder of Springfield, Mass,

The Stanley Electrical Manufacturing Company, Trenton, N. J. to make and deal in dynamos, etc. Capital stock. \$2,000,000, Incorporators: Frank O. Briggs, William H.

Gandy, Duncan Anderson, William Anderson, John Janeway, L. H. Taylor and William Taylor, all connected with the John A. Roebling Wire Mill.

The National Electrical Appliance Company, New York City-to make electrical and chemical engines. Capital stock, \$50,000.

The New York & Nassau County Railroad Company. Long Island City, N. Y.—to build and operate an electric street railroad. Capital stock, \$150,000. Directors: Daniel Noble, Daniel Callahan, Matthew J. Smith, William L. Woodill, Long Island City; Joseph Bermel, Middle Village; Frederick Bowley, Astoria; Joseph Meycrose, Evergreens; Edward J. McKeever, Brooklyn; Henry P. Keith, Hempstead.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 802 and 804 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City. N. Y., or 639 F street, N. W., Washington, D. C.

Copies of any patent published can be furnished upon paynent of ten cents. When ordering give name, date and title of invention wanted.]

## GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Anderson, Ind.—The electric light plant owned by the city will be greatly cularged.

Baltimore, Mi.—Mayor Hayes has appointed Prof. Jacob H. Hollander, of the Johns Hopkins University; Mr. Edwin G. Baetjer, attorney-at-law; Mr. Charles E. Phelps, Jr., chief engineer of the municipal electrical subway commission, to inquire into the fessibility, practicability and expediency of establishing a municipal electric lighting plant.

Carthage, N. Y.—A New York electric light company has been making inquiries and doing some corresponding in regard to the advisability of locating a plant in this place.

Chelsea, Is.—There is a movement on foot here for an electric light plant.

Columbus, Ga.—This city is considering the advisability of erecting its own electric lighting plant.

Dayton, O.—Bids will be received by L. Traxler for the erection of a 6) horse pow r electric light plant. Address L. Traxler, corner Main and Fifth streets.

De Smet, S. D.—The citizens of this place are agitating the question of building an electric light plant. H. W. Mason is interested.

Elbow Lake, Minn.—The subject of putting in an electric light plant to light the city is being talked of. The question will probably be submitted to the people.

Elkader, Ia.—Messrs. Schmidt Bros. & Co. will ask the town council to submit to a vote of the people the question of granting to them a 20 years' franchise to put in an electric light plant.

Fredericksburg, Va.—This city will issue \$12,000 bonds for a street lighting plant.

Fulshear, Tex.—H. E. Thompson of this city wants estimates on an electric light plant of 200 thirty-two candle power incandescent lamps, and 15 2,000 candle power arc lights.

Greensborough, Pa.—The county commissioners propose to purchase an electric light plant for the courthouse and jail, to cost about \$1,700.

Harrisburg, Pa.—E V. Sinstein & Co. propose to install an electric lighting plant at this place.

Henderson, Ky.—The city council has authorized the employment of an electric light expert to make an estimate on an electric light plant to be owned by the municipality.

Irvine, Ky.—This city is preparing to grant a franchise for the construction and operation of an electric light plant, etc. Bids will be received until January 22. Address S. L. Tudor.

Jamestown, Ind.—Steel & Richmond contemplate the erection of an electric light plant in this place.

Manchester, Is.—An electric lighting plant will soon be erected in this city.

Morristown, Tenn.—In all probability this city will erect a new and larger electric light plant in the early spring.

Ocean Springs, Miss.—E. W. Wickey of Indiana is in the city looking over the field with a view of erecting an electric light plant.

Omaha, Neb.—Mayor Moore urges the city council to take immediate action to acquire an electric light plant.

Peaks Island, Me.—The electric light station at this place is to be entirely remodeled for service next season.

Perrysburg, O.—The electric light plant will soon be equipped for incandescent lighting.

Philadelphia, Pa.—The Woodbury Electric Light

Philadelphia, Pa.—The Woodbury Electric Light Company has decided to put in a plant for incandescent lighting.

Bichmond, Va—An electric light plant is to be erected on the site of the old Haxall Mills, to cost about \$1,000,000.

San Leandro. Cal.—The board of trustees of this city will advertise for bids to light the streets with electric lights. Parties interested in furnishing electric lights are invited to make propositions.

Sing Sing, N. Y.—A new electric lighting company has asked the village trustees for a franchise to put in an electric light plant here.

St. Louis, Mo —A \$6,000,000 corporation will erect a \$3,000,000 electric light and power plant to compete for the city lighting and furnish light, heat and power throughout this city and suburban towns. Plans have been prepared and bids will be advertised for in a few weeks. The stockholders are J. S. Walsh, A. Gehner, E. Benoist and others.

Syracuse, N. Y.—The Mayor recommends that the council and residents of this city unite in beginning preparations at once for the municipal ownership of an electrical lighting plant, which shall be ready for use at the end of the present seven years' contract for public lighting.

Tallahassee, Fla.—The city council has decided to erect a municipal electric light plant.

#### STREET RAILWAYS.

Allentown, Pa.—The Allentown & Bangor Street Railway Company is to construct an electric road from Catasauqua to Bangor, a distance of about twenty miles.

Amsterdam, N. Y.—A plan is on foot to connect this city with Ballston Spa by an electric road, a distance of 18 miles.

Defiance, O.—The People's Gas & Electric Company of this city, has enlarged the scope of its purpose so as to authorize it to operate an electric street railroad.

Jamestown, N. Y.—A letter has been received here from parties in New York City asking councils if a liberal proposition fer the building of an electric road in Corry and from that city to Chautauqua lake via Findley lake, would receive consideration. The New York parties will no doubt receive a satisfactory reply.

Joliet, Ill.—The Joliet Railway Company has been granted two 20 year franchises, one for an electric line from this city to Manhattan, a distance of eleven miles to the southeast, and one for a line from Joliet to Plainfield, a distance of nine miles to the northwest. The company is also preparing to build its line from Lockport to Chicago.

Joplin, Mo.—A new electric railway is projected for this city. The probable course will be via Galena Empire City. Baxter, Columbus and Weir City to Pittsburg. F. W. Blees of Macon, Mo., and J. F. Schaefer are interested in the enterprise.

Kansas City, Mo.—A company has been formed to build an electric line between here and Warrensburg, Mo., a distance of 38 miles. A. E. Holmes and A. M. G. ssett, of Kansas City, are among the promotors.

Logansport, Ind.—The directors of the Logansport, Richester & Northern Traction Company have authorized a bond issue of \$2.5.10,000. The proceeds will be utilized in the construction and equipment of the electric line to Kendallville.

Menominee, Mich.—Several Menominee County capitalists are considering the plan of building an electric street car line through the county at least to Powers. Power stations would be built in this city and at Powers. The line would necessitate the expenditure of \$200,000. I Carley, of Ingalls, G. T. Werline, of Nadeau, and others are interested in the project.

Milan, Mich.—An electric railway between this village and Ypsilanti is being projected and it is the intention of its promotors to extend the line to Adrian. R Hemphill of Ypsilanti has applied to the York township board for a franchise for the road through the township.

Milwaukee, Wis.—E. O. Humphrey, a promoter of Chicago, was in Milwaukee lately for the purpose, he says, of interesting capitalists in an elevated electric railroad which he expects to build between this city and Chicago.

Ortonville, Mich.—Messrs. Lau & Winters have secured a franchise through the township of Brandon for an electric railroad running from ()xford to Flint. Surveys are now being made.

Waukegan, Ill.—The Chicago & Milwaukee E ectric Railway may double-track its road to this city and build north. A new electric line from the harbor to the country west is also projected.

Wellsville, N.Y.—The village board has granted a franchise for the Wellsville & Bolivar Electric Railway, seventeen miles long, which Wellsville men, backed by New York capitalis's, propose to build. The cost of building and equipping the line is estimated at \$20,000.

Whitehall, N. Y.—This town has granted a franchise to the Whitehall & Granville Electric Railroad to run its lines through the streets.

#### MANUFACTURING, ETC.

Casey, I'l.—The council has awarded the contract for the erection of a joint system of waterworks and electric lights to the Commercial Electric Company of Chicago at a cost of \$36,000, the plant to be completed and turned over to the city June 15.

Dayton, O.—The Toledo Traction Company has placed an order with the Barney & Smith Company of this city for thirteen new street cars, to be delivered May 1.

Norfolk, Va.—The contract for the erection of an electric lighting plant at the navy yard, has been awarded to the firm of L. L. Leach & Son of Chicago, at their bid of \$73,371.

Pittsburg, Pa.—Lucin Marechal, chief engineer of the Paris, Lyons & Mediterranean Railroad of France, who is in this country on a tour of inspection, has placed an order with the Pressed Steel Car Company of this city for five hundred steel gondola cars of a special design. This order marks the introduction of American steel cars on the European Continent, and may be considered a new epoch in railway equipment in the Old World.

Schenectady, N. Y.—One of the largest of the recent contracts undertaken by the General Electric Company was closed January 11, when a \$600,000 order for electrical equipment and material was received as the result of competition with several foreign comparies. The order is from several Italian cities, one of which is understood to be Turin.

Trenton, N. J.—The Trenton Gas & Electric Company are about to make an addition to their works located on Chauncey street. It will consist of a building 89x 100 feet. One of the features of the new building will be a traveling crane with a capacity of fifteen tons, that will be placed so that it can be run the whole length of the building. The improvement will cost about \$200,000.

#### COMPANY MATTERS.

Auburn, N. Y.—The Auburn Electric Light, Heat & Power Company has purchased the English property in Steam laue adjoining its plant, for the purpose of constructing an addition.

Clear Lake, Ia.—The Clear Lake Electric Light & Power Company has decided to double the capacity of its plant. The power house will be rebuilt. The capital stock was increased from \$10,000 to \$20,000.

Colorado Springs, Col.—The El Paso Electric Company of this city passed into the hands of the Union Gas & Electric Company of New York City. The New York Company is in other words the trust, and the price it pays for the last company in this city holding out against the trust is \$385,000.

Galesburgh, Ill.—The Farmington electric light plant is likely to pass into the hands of Chicago capitalists.

Hammond, Ind.—The barns of the South Chicago Railway were destroyed by fire last week. Thirty-two cars were also destroyed. The loss, fully covered by insurance, is put at \$230,000.

Electric Light, Heat & Power Company has been sold to Newtown Jackson, of Stranton, representing, it is said, the United Heat, Light, Power & Transportation Company of Philadelphia.

Park City, Utah.—It is expected that the Park City Electric Light, Heat & Power Company will soon be merged into the Outario electric system.

Princeton, Ill.—The Princeton Electric Light Company has offered its plant for sale and the city may buy it.

Radford, Va.—The Radford Electric Light & Power Company contemplates the purchase of more dynamos or else the erection of another plant.

St. Louis, Mo.—The Imperial Electric Light, Heat & Power Company and the Consolidated Electric Company of this city have fied a certificate of consolidation under the name of the Imperial Electric Light, Heat & Power Company.

Trenton, N. J.—It is now said that the Stanley Electric Company, which has been bought by the Roebling Company of this city, will be operated by that company in connection with the Cramp Shipyard Company.

Warren, () —The Warren E'ectric & Specialty Company has doubled its capital stock, making it \$200,000.

#### POWER AND TRANSMISSION PLANTS.

Asotin, Wash.—An electric power plant, costing about \$400,000, will soon be installed on Asotin Creek. It is designed to run an electric street railway in Lewiston, Idaho, Clarkston and Washington. The electric power plant will also have sufficient power to supply several factories and flouring mills in Clarkston, as well as to furnish illumination for the town.

Warsaw, Ind.—The immense principal power house of the Logansport, Rochester & Northern Traction Company's electric line will be located here. It is estimated that the building will cost \$100,000.

## MINES, ETC.

Angels Camp, Cal.—It is learned on good authority that the Uvica Company will extend its lately installed electric-power line to Sonora, Tuolumne county, in the spring. This means a great thing for the mining industry in that county.

spring. It is means a great thing for the mining industry in that county.

Chamberlain, S. D.—The Chamberlain Electric Light Company has practically closed a contract with Mahanna & Johnston for drilling a new power artesian well in the near vicinity of the old one.

Pittsburg, Pa.—The Monongahela Consolidated Coal & Coke Company has decided to erect three electric power houses at Gastonville, Brownsville and Monongahela, along the river, to furnish power for the operation of its mining machinery. The stations will cost about \$150,000.

#### AUTOMOBILES.

Cleveland, O.—The Elwell-Parker Electric Company of this city will make automobiles. The president, F. C. Phillips, said "We shall have one of our vehicles running on the streets in a month or two."

Milwaukee, Wis.—It is reported that a company is being organized to run lines of omnituses in this city in competition with the street-car service. These 'buses are to be propelled by electricity and to have pneumatic tires. The estimated cost of each 'bus is \$1 600.

New York.—Cyrus Field Judson, president of the reorganized General Carriage Company of this city, has announced that the company will put into service 100 omnibuses and 200 cabs and carriages. Some of the conveyances will be operated by electricity, others by air power and others by gasoline.

## THE TELEPHONE WORLD.

### The Missouri Independents Meet.

The second annual convention of the Missouri Independent Telephone Association was held recently at the Lindell Hotel in St. Louis, Mo., and about twenty companies were represented. J. A. Hudson, of Macon, presided at the meeting, and Theodore Gary, of Columbia, acted as secretary.

Among those present were W. N. Wicks of Glasgow, C. E.

Among those present were W. N. Wicks of Glasgow, C. E. Betts of Fayette, John M. McCulley of Shelbina, George R. Armstrong of Pierce City, A. R. Ponder of Cape Girardeau, John Enoch of St. Charles, John E. Brooks of Cape Girardeau, A. A. Tibbe of Washington, John W. Lane of Carthage, and M. A. King of St. Louis. Mr. King and John W. Lane, president of the Carthage Electric & Telephone Company, were elected to membership in the association.

The question of incorporating the association was discussed and also the question of levying an assessment of 10 cents per year on each 'phone in use, the money to be used as a fund to defend the independent companies against the encroachments of the trust. After considerable discussion the president was authorized to appoint a committee to arrange for the incorporation and assessments, and John Enoch, John W. Lane, Theodore Gary and C. E. Betts were appointed on this committee. President Hudson is an ex-officio member.

A proposition to eliminate the clause in the by-laws which provides that no company represented in the association shall be entitled to more than three votes was also discussed, but no definite action was taken. The Kinloch Telephone Company of Missouri, which is not a member of the association, has, it is said, refused to join on account of this restriction, as it deems that on account of its relative size and importance it should be allowed more than three votes.

The attention of the delegates was also directed to the plans of the Kinloch Company to organize a company for the purpose of constructing an independent long-distance telephone line across the State of Missouri from St. Louis to St. Joseph and Kansas City, and thence down to Joplin and the adjacent towns.

A meeting of the directors of the Kinloch Telephone Company was held after the regular meeting, but President Kennard is reported as saying that only routine business was transacted, and that no proposition to join the Missouri Independent Telephone Association was discussed. Another meeting of the association will be held in the spring.

For weeks past there have been rumors of an attempt by outsiders to secure a controlling interest in the Detroit Tele Company for the purpose of consolidating it with other independent concerns to fight the old companies. It is now stated that these attempts have not been made by any other independent company, Lut by C. J. Glidden, of Lowell, Mass., president of the Erie Telephone Company, a corporation which has purchased the Bell lines in Michigan, Texas, Wisconsin, Minnesota, North and South Dakota, Oklahoma, and the city of Cleveland. Mr. Glidden has been in Detroit frequently of late, and made overtures to stockholders in the Detroit Company for the purchase of their stock. The stockholders say the offers are too low, and that there is no danger of their selling at any price unless the purchasers will make some sort of an agreement to protect the new State Telephone Company. Practically no attempt has been made to secure control of the latter, for the reason that the stock is scattered all over the State in small holdings.

The Citizens Electric Light & Power Company of St. Louis, which was organized three years ago for the purpose of laying telephone wires and conduits in that city, but which has been inactive since its incorporation, has decided to commence operations, and will increase its capital stock from \$1,000,000 to \$3,000,000. At the time of its formation the city granted it the frai chise for the laying of subways. Its charter also permitted it to make and sell electricity for lighting, heat and power purposes. The company has decided to go into the electric business on a large scale, and a plant will be receted in East St. Louis. C. J. Hopkins Hanford, a director of the People's Telephone Corporation of this city, who formed the Kinloch Telephone Company of St. Louis, which is the owner of a majority of the stock of the Citizens' Electric Light & Power Company, is reported as saying that the company intended to be a strong competitor for electric business in St. Louis.

Judge Goff, of the United States Circuit Court has rendered an opinion in the case of the city of Richmond, Va., against the Southern Bell Telephone Company, which is a victory for Richmond. Some years ago the franchise of the telephone company expired, the city declined to renew it and ordered the company to remove its poles and wires. The company refused and secured an injunction restraining the city from interfering with the company on the ground that the streets are post roads of the United States. The case went to the Supreme Court. Judge Goff was reversed, and the matter was remanded. Judge Goff rendered an opinion in accordance with the Supreme Court's mandate, dissolving the injunction and dismissing the bill.

#### Kansas City's Telephones.

The growth of the telephone has been phenomenal, says the Kansas City (Mo.) Journal. Its importance as a factor in the mercantile world was acknowledged long before it had been perfected for practical use and as soon as its successful operation was assured it became an absolute necessity. To the professional man it was equally indispensable and almost simultaneously it found its way into private residences and homes. Now its installation is almost universal. The busy man of affairs must have it right at his hand at all hours of the day and night, the society woman and the careful housewife is no longer content to make a trip to a neighboring drug store when she wishes to use it. The person without a telephone is practically buried in a large city.

The telephone has been a prime factor in the building up of large cities. It makes a suburban residence even endurable. It annihilates time and space with equal facility. The housewife need no longer make countless tiresome trips downtown doesk and hold personal conversation with a patron in any part of the country. Its agency makes a resident in any other city, North, South, East or West, a next door neighbor. It has never been a luxury and its necessity is now universally conceded. No less than 440 toll stations, or stations outside the city, are now connected with the local system.

Kansas City has now 4,800 telephones in daily use as compared with 3,500 at the commencement of 1899, and so far from the demand showing any signs of being fully supplied, it is increasing constantly. In addition to the large number of local 'phones, the system is connected with over 400 thriving towns in the adjacent and tributary country. The long-distance service is being constantly added to until now its tentacles of wires embrace the entire country. Direct communication is now had by Kansas City with all principal points in thirty two States.

The minority stockholders of the Newark (N. J.) Telephone Company, says the N. Y. Tribune, propose to organize for the purpose of engaging counsel to look into the recent sale of a controlling interest in the company and to protect the minority interest. The sale of the majority of the stock was effected last November by Thomas A. Nevins and Samuel Doty to Colonel J. B. Curtis, who lately secured control of the Hudson Telephone Company of  $\,$  Jersey City. It is alleged by minority stockholders that the New York & New Jersey Telephone Company is back of Colonel Curtis, and intends to reorganize the Newark Telephone Company, have it sold out and buy it in on terms that will leave the minority stockholders out in the cold. Mr. Nevins holds a claim of \$86,910.36 against the company for construction and it is feared that the concern will be closed out at a figure just to satisfy that claim. There is a question whether the company has not by non-fulfilment of its franchise forfeited its rights and also the ownership of the subways laid. The Board of Works has the option of revoking the franchise under certain

Six inches of snow has caused the suspension of work on the long distance telephone line under construction by the Sunset Telephone Company in the Bradshaw mountains of Northern Arizona, says the Los Angeles. Cal., Heral I. The force has been transferred to a point still farther north, and preparation has been made for rechanging it to the extreme southern end of the line, building south from Tucson in case of more snowing north. At places where hills and mountains are being crossed by the line, burro trains are put in operation. They make an important auxiliary to the force in carrying poles over the mountains. The telephone system recently established in Tucson is meeting with success beyond former expectations of the manager. There are more than 200 phones in operation.

A new telephone line, connecting Middleport, N. Y. with Johnson's Creek and Jeddo, has been constructed by E. B. Crosby of Lockport, N. Y. The line has been named the Ridge Road Telephone Line. There are now about eight miles of poles and wires up and the line is in fine working order. The residents and shippers along the ridge are enthusiastic about the new line as it is the first electric communication the town of Hartland has ever had with the outside world. The enterprise is enjoying a good patronage and will, it is said, be extended as soon as the weather permits.

A dispatch from Waupaca, Wis., states that the Wolf River Telephone Company has completed the purchase of the lines and franchises of the Badger Telephone Company. The latter had about fifty miles of toll line besides an exchange in Waupaca. The Badger line extends from Waupaca into Waushara County and will make an important feeder to the Wolf River system.

There is said to be strong talk of extending a telephone line from Mason City, Neb., to Ansley and then to Broken Bow. There is now a line from Mason City to Loup City via Litchfield. The East Tennessee Telephone Company, which operates in Bristol, Va., has advanced the price of service from 100 to 200 per cent. Residence phones have been raised from \$1.50 each per quarter to \$3, and business house phones from \$1.50 to \$4.50. The advance has resulted in a kick, and the company is losing subscribers. The situation is said to be pleasing to the Bristo! Telephone Company, which has an exchange in Bristo!

The Mississippi Valley Telephone Company announces that over one half million of dollars has been invested already in the exchange in Minneapolis, Minn., that it is connecting up the instruments as fast as possible. The company has now in operation in Minneapolis 1,300 phones and by the 20th of this month will have 300 more. In St. Paul 700 'phones have been connected and by February 1 there will be from 1,300 to 1.5(0 in operation).

The supervisors of San Francisco, Cal., have passed an amended telephone tax ordinance to meet the objections of Mayor Phelan, who vetoed  $\alpha$  previous ordinance some weeks ago. The new ordinance places a tax on all telephones instead of on nickel-in-the-slot machines alone. The tax amounts to 50 cents per quarter.

Probably the world's first aluminum telephone system is in operation between Pittsburg. Pa., and New Kensington, a distance of eighteen miles, and is so much of a success that it is said the Pennsylvania Company, operating lines west of Pittsburg, has ordered a similar system to be used in connection with the heavy copper system now in use.

The independent telephone companies of Michigan will hold their annual meeting at Battle Creek on February 9. There will be at least one hundred representatives composed of hustlers in the independent field. The association will be entertained by the Calhoun County Telephone Company.

The Cumberland Telephone Company has completed a toll line into Bowling Green, Ky. It is an extension of the line from Central City and includes Rochester, Morgantown and other Green River points. At Bowling Green connection was made with Franklin, and forty or fifty other points.

At a special meeting on January 11 of the Gloucester, N. J., city council an ordinance permitting the Telephone Company of New Jersey to erect poles and string wires through that city was passed on its final reading. The new company has been organized in opposition to the Bell Cempany, and will cut rates.

The wire mileage of the Erie Telegraph & Telephone Company system was increased during the year 1889 as follows: Long distance poles set 3,127 miles; long distance wires strung, mostly copper, 25,552 miles. Grand total miles in operation: Pole lines 19,123 miles; wire 196,349 miles.

The Fairmont Telephone Company, of Fairmont, Minn. held its annual meeting on the 2d inst. and reported a prosperous state of affairs, declared a 12 per cent. cash dividend, elected the old board of directors, and adjourned.

The Knickerbocker Telephone Company of New York City, is making preparations to build a telephone line through the Borough of Queens and to all the principal villages of Nassau and Suffolk counties.

The Cumberland Telephone & Telegraph Company will put in an exchange at Earlington, Ky.

### TELEPHONE INCORPORATIONS.

The American Telephone Repeater & Quad Company, Dover, Del. Capital stock \$200,000.

The Saline County Telephone Company, Galatia, Ill. Capital stock, \$10,000. Incorporators: Charles Temple, George H. Mitchell and T. E. Webber.

The Carolina Telephone & Telegraph Company, Tarborough, N. C. Capital stock, \$50,000. Incorporators: George A. Holderness, W. H. Powell and W. H. McNair.

The Black River Telephone Company—to operate a telephone system between Utica and Watertown, N. Y. Capital stock §25,000. Incorporators: John J. Dollser, Philip Dollser, Frederick F. Myers, S. C. Capron, Benedict Gautner, H. C. Markham, David Swoncott and Frank Harrington.

The Canal Dover Home Telephone Company—to operate a system in Tuscarawas County, O. Capital stock, \$40,000. Incorporators: D. T. Croxten, D. Defenbacher, A. Deis, C. H. Slingluff and C. D. Juvenill.

The Mugg Telephone Company—to operate in Owen County, Ind. Capital stock, \$1,000. Incorporators: Joseph T. Mugg, B. Frank Mugg and Thomas H. Morris,

## \_ECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

## NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 15%@16c.; Lake, 16@16\2c.; casting, 15\2\\@15\2c.

The stockholders of the Harrisburg (Pa.) Traction Company will receive a quarterly dividend of  $1\frac{1}{2}$  per cent.

The Mexican Electric Vehicle Company was incorporated at Trenton, N. J., on January 11 with a capital stock of \$500,000.

The Berliner Gramophone Company of Philadelphia paid on January 12 a dividend of \$1 per share to stock of record January 11.

The General Electric Company will pay a dividend of \$3 59 per share on its preferred stock on January 31 to stockholders of record January 15.

The Citizens Electric Light & Power Co. of St. Louis, Mo., has decided to

issue \$2,000,000 worth of new stock and will enter the electric business.

The stockholders of the Warren Electric and Specialty Company of Warren, O., have decided to increase the capital of the company from \$100,000 to \$200,000.

The Electric Company of America has declared a semi-annual dividend of 50 cents per share, payable January 30. Books close January 20 and reopen January 30.

It is understood that the United Power & Transportation Company has purchased the plant of the Kennett Electric Light, Heat & Power Company in Chester county, Pa.

The committee on securities of the New York Stock Exchange has ruled that transactions in Brooklyn Rapid Transit certificates may be settled by the delivery of the new stock.

The rumor that was current last week to the effect that the Metropolitan Street Railway Company of New York had gotten control of the Third Avenue Railroad Company is denied.

It is reported that Edwin Gould has bought a controlling interest in the General Carriage Company, which will operate electrically propelled cabs and omnibuses in New York City.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 20@23; New York Electric Vehicle Transportation,  $9@@10\frac{1}{2}$ ; New England Transportation,  $6@6\frac{1}{2}$ .

A dispatch from Washington, D. C., states that the Industrial Commission expects to make a report February 1 in regard to trusts. The report will recommend Government supervision similar to that of National banks.

The directors of the Logansport, Rochester & Northern Traction Company of Logansport, Ind., have authorized the issue of \$2,500,000 first mortgage bonds, which will be sold and proceeds applied to building and equipping the line.

There is a strong rumor that Mr. Appleyard, of Boston, president of the Chippewa Valley Electric Bailway Company, has bought the plant and franchise of the Eau Claire (Wis.) Light & Power Company, which is bonded for \$200,000.

The Consolidated Railway Electric Light & Equipment Company, with a capital of \$16,000,000, has been incorporated at Trenton, N. J. The company is empowered to make use of electric light and power and also to manufacture gas.

The Lynn Gas & Electric Company of Lynn, Mass., has voted to increase the capital stock of the company from \$400,000 to \$600,000. The new issue is being made to take care of their floating debt and to provide funds for the erection of a new plant.

Directors of the Chicago Edison Company have voted to issue \$1,000,000 of new stock in accordance with the authorization of the shareholders. The issue will be equal to 20 per cent. of the present capital stock and will be offered at par to stock or record January 25. It is payable February 1.

The 20,000 shares of Erie Telegraph & Telephone Company's treasury stock, offered to stockholders by circular on January 8, will, it is reported, participate in the quarterly dividend, No. 66, of 1½ per cent., which will be declared in the latter part of March, payable the second Monday of April.

The transfer of the control of the Perkins Electric Switch Company of Hartford, Conn., to the Bryant Electric Company of Bridgeport, Conn., has been completed. It is understood the works will remain in Hartford. The price paid for the stock is given out at \$116 for each \$100 share. The capital of the Perkins Company is \$125,000.

The two electric light plants in Kansas City, Mo, have passed into control of the Armours and the men who are associated with them in the ownership of the street car systems of that city. C. F. Holmes, general manager of the Metropolitan Street Railway Company, has been elected president of the two light companies. The two light plants represent about \$1,000,000 invested.

The Harrisburg, Pa., Light, Heat & Power Company will not declare a dividend before April 1, if then. During the year there was a reorganization, the stockholders of the Harrisburg Electric Company disposing of their holdings to the present company, which has just expended about \$70,000 upon a new power plant. A 4 per cent. dividend from the start was expected.

The South Brooklyn Railway Company of Brooklyn was incorporated at Albany, N. Y., on the 13th inst., with a capital of \$150,000, to operate by steam or electricity a railroad twelve miles long, intended for summer travel, from Second avenue, near 39th street, Brooklyn, thence parallel with 39th street to the boundary line between the Eighth and Thirtieth wards, and thence northeasterly to the Kings County line at Liberty avenue in the Twenty-sixth ward.

To determine the best motive power for use on the Boston Elevated Railway, as between the General Electric, Westinghouse and Sprague systems, the elevated company is constructing a shed and two spur tracks in the vacant space inside the North Station loop to be used in making tests with dummy trains in the subway between the hours of midnight and 6 \( \lambda \). M, when the subway is closed to regular traffic. The Manhattan Elevated officials will be represented at the tests.

The New York "News Bureau" says it understands on good authority that the assessment of \$5 per share, due February 15 on Electric Axle stock will be the final call. This payment will make \$10 per share paid in. The company has decided to issue its certificates at a par value of \$10 a share, which will be fully paid in, instead of at a par of \$100, with only \$10 paid in. The stock, as it is now proposed to issue it, will be non-assessable. It is expected that the stock certificates will be ready for delivery between February 15 and March 1 next.

A dispatch from Lyons, N. Y., states that the plant of the Clyde Gas & Electric Company has been taken in charge by Sheriff Wheeler under six judgments aggregating \$1,642, obtained by Syracuse creditors. The stockholders of the company have petitioned Justice Dunwell for voluntary dissolution of the corporation and Justice Dunwell has issued an order to show cause why the corporation should not be dissolved, the order being made returnable February 1. The value of the part is placed at \$71,344; uncollected accounts, \$990; liabilities, \$50,279. The Clyde G.s & Electric Company supply electric light, heat and power as well as steam heat.

## EDITORIAL NOTES.

# The Northwestern Electrical Association Convention.

The Eighth Annual Convention of the Northwestern Electrical Association was held on Janu-

ary 17, 18 and 19 at the Hotel Pfister, Milwaukee, Wis.

As usual the papers presented and topics discussed were of a high order and of vital interest to the electrical industry. A former criticism of ours, to the effect that the subjects presented at the meeting of this Society were usually too technical in character, would scarcely apply to the papers presented at the meeting just drawn to a close, for generally speaking most of the subjects were handled in such a way as to be of benefit not only to the theorist, but to the practical worker as well. That the influence of the Society, which embodies the best electrical talent of the Northwest, is spreading, is not to be doubted, for while formerly the interest taken in its Conventions scarcely extended beyond Chicago and neighboring cities, at the present day the papers read and discussions indulged in are looked forward to with interest by electrical workers all over the country.

The social features of the Convention recently held were everything that could be desired. No pains were spared to make the visitors' stay enjoyable—theater parties being indulged in on Wednesday evening, while on Thursday night the customary annual banquet was held.

\* \* :

Rapid Transit in Sight.

Elsewhere in this issue will be found an illustrated article descriptive of one of the underground

railways of London, which in view of the fact that after some four years of discussion and uncertainty New York City is about to begin the construction of a somewhat similar road, would seem both timely and interesting.

Like all great enterprises, especially those put through by a municipality, the arranging of financial and other matters looking to the construction of a much needed rapid transit system for this city, has been handicapped by an immense amount of red tape. First the city was to build the road as a municipal enterprise and lease the privilege of operating it for a given term of years to the highest respon-

sible bidder. After considerable delay this plan was abandoned, as it was found on investigation that the city was not in a position to issue bonds to the extent of some \$30,000,000. Next a proposition was made looking to the construction of the road with private capital, but after a lengthy discussion the bidder withdrew his proposition owing to the onerous conditions imposed by the Rapid Transit Commission and city authorities. Steps were then taken to have the county debt separated from the city debt, with the result that the municipal fathers were in a position to sanction the issuing of the necessary amount of bonds. Bids were then called for and, as stated in our last issue, two were received. One was \$35,-000,000 the other \$39,300,000. Needless to say the lower bidder's proposition was accepted, with the result that work is actually to begin about the first week of next month.

The building of the underground rapid transit road in this city will undoubtedly prove one of the most gigantic railway undertakings ever attempted in this section of the country. The principal difficulty will lie in the fact that almost 21 miles of road will have to be excavated or tunneled through a soil saturated with water and through which radiate in all directions sewer pipes, water mains, gas pipes, and subways for electrical conductors. Some idea may be had of the immense amount of labor the construction of this underground road will entail when it is stated that a force of 8,000 to 10,000 men will be constantly employed and that even with this army of workmen it will take three years to complete the work.

When the road is in working order the tunnel will be lighted throughout by electric lights sunk into recesses in the walls. To ensure thorough ventilation a system of electrically-driven ventilating fans will be adopted, and as electricity will be made use of for running the trains no trouble will be experienced with smoke or cinders, as was the case in the underground roads of London a few years ago.

The signaling devices will be of the most approved character, and preference will be given to a system which will automatically bring a train to a stop in the event of a motorman failing to obey a danger signal. That a reliable automatic system is of vital importance may be inferred when it is stated that it is proposed to run express trains at a speed of forty miles an hour with a minimum headway of two minutes.

Referring to the fact that increased facilities

for travel usually means an increase in the number of passengers carried, Mr. William Barclay Parsons, chief engineer for the Rapid Transit Commission, is reported as saying:

"The number of 'strap hangers' between here and Harlem will not be diminished by one. The city will grow with the added transit facilities, just as it always has done, and there will be as many to ride on this new road as there will be to ride on the old roads.

"It is true that this new road will be able to carry more passengers than the elevated roads, but there will be more people to carry. The elevated roads are limited to five train cars. In the tunnel we may run as many cars to a train as we like, because there will be nothing to give way under their weight. The cars will be bigger and the trains will be more frequent. The trains in the tunnel can run on forty-five seconds headway for the locals and about two minutes for the express trains. There are no grade crossings or switches to interfere with their movements.

"This will be but the advance guard of the coming extension to South Ferry, and when that has come, and perhaps before, there will be tunnels under the East River to connect with Brooklyn and Staten Island."

\* \*

The Advantages of the Metric System of Weights and Measures. At almost every session of Congress during the past half dozen years a bill has been introduced looking to

the adoption of the metric system of weights and measures. The bills have invariably failed to reach a vote, owing to the general laxness of manufacturers and merchants in failing to impress upon their representatives in Washington the importance of sustaining and urging the passage of such a measure. A bill of this nature is again before Congress, making it obligatory on the Government from and after January 1, 1901, in the transaction of all business requiring the use of weights and measurements, except completing the survey of public lands, to employ and use only the weights and measures of the metric system, and prescribing that from January 1, 1902, the metric system of weights and measures shall be the legal standard weights and measures in the United States.

That both England and the United States are seriously handicapped in seeking foreign trade by the system of weights and measures now in vogue there is little doubt, as price lists and catalogues gotten out by English and American firms are necessarily more or less confusing to foreign merchants. That Great Britain appreciates this fact may be inferred from the following paragraph that appeared some time ago in one of our English contemporaries:

"Operations are hampered in many foreign markets, owing to the insistence with which we continue calculating in pounds, shillings and pence, and measuring by yards, feet and inches. Deputations have called upon the Government, and the whole press has filled its columns with advocacy of the metric system. But still the old plan is continued. We understand the first practical step is now being taken in the London Board schools, and at the meeting of the school board recently the school management committee reported the receipt of communications with reference to the adoption of the metric system, which was to a certain extent being taught in the Board schools.

It was resolved to send a memorandum to the department containing proposals for amplifying the teaching of the system by a definite curriculum for each standard."

The principal obstacle in the way of the introduction of the proposed system lies in the attachment of the people to familiar terms, processes and things. They have a definite idea what a pound or a yard means, while they have a very indefinite or uncertain idea of what a kilogram or a meter means, and they fear they never will understand. They are accustomed to the ordinary division into halves and again into quarters; they understand the movement by tens and tenths in numeration and notation, but they are a little dazed by what they suppose is its necessary application to all operations of measurement or weight. In practical life they will undoubtedly use the half kilogram, approximating the pound; the half liter, approximating the pint, and the half meter, approximating the half yard, and very likely the quarters of each, as we do the half and quarter dollars.

Gradually and imperceptibly these designations will fade away as the generation into whose life they have been so thoroughly inwrought fades away, as was the case in Germany and has been the case with our currency system here. Our fathers adhered to the use of their diverse shillings, differing in value in almost every State, but it gradually became in each State a local custom not affecting the general symmetry or general national use of our decimal system, and gradually faded out of use altogether.

The fact that our foreign trade is extending so largely has much to do with the appreciation of the fact that the use of the metric system is desirable. Many of our progressive and enlightened manufacturers, especially in the electrical line, are already prepared for it, and some, who have entered extensively into foreign trade, would welcome it as relieving them from the necessity of keeping double standards and double sets of measures and weights.

A nation ordinarily progressive can not longer afford to linger in the rear of this movement. The metric system, by reason of its decimal scale, its simplicity, its international character, and its unquestionable superiority to any other system of weights and measures, is worthy of universal adoption, and January 1, 1901, the opening of the new century, would be a good time to introduce it in this country.

Attorney General Griggs has advised the Treasury Department that no further proceedings will be directed by the United States in the case of the United States vs. Hugo Reisinger of New York. The question at issue in this case, which was tried before the Circuit Court of Appeals for the Second Circuit, was as to the proper classification for dutiable purposes of carbons for electric lighting. The importer contended that carbons were dutiable at the rate of 90 cents per hundred in the lengths in which imported (36 inches), under paragraph 97 of the present tariff act, as "articles composed of carbon, not specially provided for." The Government contended that the carbons should be assessed for duty at 90 cents per hundred carbons of the extreme length for lighting, viz., 12 inches, under paragraph 98 of the same act. The Government's contention was sustained by the United States Board of General Appraisers, but upon appeal t) the Circuit Court of Appeals for the Second Circuit this decision was reversed, and a verdict given for the importer. The Collector of Customs at New York has been authorized to forward to the Treasury Department the usual certified statement for refund of the duties exacted in excess.

## UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

THE two automobile stages which the Fifth Avenue Stage Company of New York City put on its line a short time ago have been a distinct success. Their superior speed and comfort were obvious at first, and the fact that they have not yet had a runaway or breakdown shows that they are quite practicable. At present there are only two in operation, but two more are in process of construction to be put on within a month, and after that others will be added gradually until the old stages have been displaced. The two new motor stages are running between 62d and 4th streets instead of from 88th street to Bleecker street, as do the old horse stages, but even in this distance it is found that about twenty minutes' time is saved each way.

A Lynn (Mass.) paper says that Prof. Elihu Thomson has pending, ready for issue, a patent on what he calls the "sun furnace," which he claims is adaptable to smelting ores and generating heat far intenser than the electric furnace. Metallurgists say that it is well adapted to glass making and manufacturing of carbide. The application made by Prof. Thomson is a wide one, and after carefully studying it at the Patent Office he has been granted a complete novelty. The invention is likely to interest mining men and large smelters of ore.

The Western Electric Company of Chicago has started seventy-two of its operatives for its plant in Belgium for the purpose of teaching native workmen the uses of American machinery and the manner of constructing telephone and other electrical devices after American methods.

Mrs. Mary T. Leiter, wife of L. Z. Leiter of Chicago, has brought suit for a receiver for the Metropolitan Street Railway of Washington, D. C., and to enjoin its transfer to the Washington Traction and Electric Company. She holds 1,270 shares.

Mr. L. F. Cook, the inventor of the Cook elevated electric railway system, which consists of a narrow elevated structure on which cars are suspended on either side, is at present in Milwaukee, Wis., endeavoring to organize a company to construct a mile of road through that city, which if successful it is proposed to ultimately extend to Chicago. The inventor claims that with his system a speed of sixty miles an hour can be attained.

GOVERNOR BRADY of Alaska proposes the use of electricity as a substitute for the cumbersome fire heated iron used in the branding of seals. He claims that if every female seal was electrically branded with the letters "U.S.," four inches in length and half an inch in width, the pelagic sealers' business would soon become so unprofitable that the seal question would be settled, for, argues the projector of the plan, 80 per cent. of the seals illegally killed are females, and the brand would ruin the skin for the use of the prospective furrier. The In-

terior Department is urged to send a force of men, fully equipped for the work, to Alaska and let them take the project in hand. The stockmen of the plains have found electricity to be infinitely more expeditious than the old method, and it would be doubly so with the thin-coated seal. "The branded seals suffer as little from the operation as do quadrupeds," says Governor Brady, "and the introduction of this system will speed the branding, which appears to be the only method by which we can prevent extinction of the species."

A RECENT issue of "Indian Engineering" states that a new telegraph line between Madras and Calcutta has now been practically finished, and that it will be ready for use in a short time. Copper conductors are used entirely for the new line so as to increase its working capacity. The route chosen is via Dhoud and Mannad. A third line will also be constructed to connect up Bombay to these lines. The copper wires along the new route are supported on oil insulators of the Johnson and Phillips type, so as to minimize the effect of the saline atmosphere along the coast.

THE submarine arc lamp, brought out a little over a year ago by Messrs. Hall, Jr., and Burdick, and described in the issue of ELECTRIC-ITY of October 19, 1898, was recently tested in New London, Conn., for the benefit of the Russian Government. An expert diver, who is familiar with deep-sea work, was engaged to conduct the experiments. The arc light was 2,900 candle power, and the power was furnished by the New London Electric Lighting Company by means of a flexible wire cable. The bottom of the river was explored, and by means of the light was discerned clearly. Small objects, which were thrown into deep water, were located quickly, and the experiments were successful in every particular. It is rumored that the Russian Government will order a number of the lamps.

The commissioners of the District of Columbia have received a letter from the mayor of Odessa, Russia, asking to be furnished with copies of contracts between a municipality and companies relative to railways and electric and gas lighting. The Russian pays the District quite a compliment in regard to its management of such matters, and the commissioners will furnish the desired information, together, probably, with a copy of their last annual report.

A SPECIAL cable dispatch to the N. Y. "Sun" from London states that the Secretary of the Wireless Telegraphy Company says that Inventor Marconi will make extensive tests in England in 1900 in behalf of the United States Government, with which negotiations are merely in abevance. Marconi thinks that the present limit of eighty-six miles in communication will shortly be raised to 150 miles. He has no belief in Nicola Tesla's promise to communicate across the Atlantic. He believes that science, while gradually progressing, will be unable to obtain such great results before the preliminary difficulties have been surmounted. Personally, he does not expect, yet, to girdle the Atlantic. Meanwhile, the "Daily News" reports that Emilion Guarini, a native of Puglia, Italy, who is little more than 20 years of age, has discovered a means of utilizing Marconi's invention at the greatest distances. He accomplishes this by means of his own invention, which is called a repeater and which he says receives the electric waves and is capable of transmitting them to other repeaters for continuous repetition. He says he needs a repeater only at every five hundredth mile. He further claims that his invention will enable polar expeditions to keep in constant communication with civilization.

THE electrical congress, held at Como, Italy. the birthplace of the immortal Volta, was marked by many incidents illustrative of the veneration in which the memory of the great Italian electrician is still held by all ranks of people, and not the least by those who cannot possibly understand one iota of his achievements. Some of the visible signs of this feeling were as amusing as they were sincere. The window of a large store would be filled with chocolate boxes made up in the form of "piles," and toy piles would be used to decorate almanacs or serve as pepper boxes. The vogue in handkerchiefs was one of silk in which Volta's portrait was woven, and cheap chromo-lithographs of "Volta discovering the pile" were on sale everywhere. One of the most impressive communications to the congress, which brought together many of the first electricians, physicists and engineers in Europe, was a paper by Senator Blaserna upon the secular changes of the magnetic inclination in the ancient times. He finds that the Etruscan and other urns of burned clay all have inclined magnetic axes of their own, and this he attributes to their having been magnetized by the earth's magnetism at the time of their being fired, thus preserving for centuries a record of the past dip in the terrestrial field. The deduction was drawn that at the date 690 B. C. the magnetic dip in Italy was zero,

WITHIN a few days the new building of the Ottawa Carbide Works will be opened at the Chaudiere Falls, Ottawa. The old structure was badly wrecked, two months ago, by a terrific explosion caused by water running into a super-heated crucible. The new building is entirely fireproof, the only inflammable material in it being the wooden sashes of the window frames. The builders consider that there are few such fire proof structures equalling this on the continent. Subsequent to the explosion referred to, the Civic Committee of Investigation in its report, recommended that in carbide manufacture, the pigs should be cooled in a room separate from the furnaces, and this feature has been followed in all its details. The new plant consists of six large furnaces, double that of the old plant, all of which will be operated. This will give an immense daily output of calcium carbide.

A CABLE dispatch from London states that the British Government Post-Telegraph departments have already contributed to the army in South Africa nearly 500 men, of whom more than 200 were skilled telegraph operators. Reports to the War Office state that the telegraphers are rendering splendid service. It is said that the use of the Wheatstone automatic system on the field of battle is the first in the history of warfare. Moreover, it was worked duplexed, which at the outset was prophesied to be impossible under the rough circumstances of campaigning. At the Modder River the telegraphers were under fire for a whole day. Then they worked through the night on official and press messages. Later, despite the rules limiting the number of correspondents and the length of a message each man can send, the operators sent 100,000 words. The total after the Magersfontein battle was much greater, but the operators got it through without a hitch at the high average speed of about 200 words per minute.

THE many attractions of Waupaca, Wis., as set forth in the following speech by Mr. Lord before the Northwestern Electrical Association, were so enticing as to cause that place to be chosen as the rendezvous for the members next summer: "Inasmuch as it has been decided to hold a summer meeting and the question of place is as yet undetermined, I wish on behalf of the city of Waupaca and the Waupaca Electric Light & Railway Company to extend to you an invitation to hold your summer meeting at Waupaca and the chain of lakes. Waupaca is in the central part of the State of Wisconsin. It is 225 miles from St. Paul and 221 miles from Chicago. It is half way between the eastern and western boundary of the State. The city is a small one of 3,000 people, but four miles from town we have the beautiful chain of lakes known as the Killarneys of Wisconsin. To this point and through the Wisconsin Veterans' Home of Waupaca the Electric Railway line runs. There are several hotels at the chain of lakes, principally the Grand View, which can take care of 250 to 300 guests. They have 12 or 15 cottages around the lakes and there are numerous other cottages. The lakes are 12 in number. They extend from one extremity to the other, a distance of about 12 miles. The shores are thickly studded with timber. The banks are high and dry and boating, bathing and fishing are good. In five minutes time you can walk out into the woods where you cannot be seen and cannot be heard. You can have a royal good time. The facilities of the railway are placed at the disposal of this Association and its friends. You are welcome to everything we can do to give you a good time. Waupaca is a summer resort. Come up and bring your wives and your daughters and your sons. Come yourselves and have a glorious summer meeting and a good time. Come up there and we will be glad to make it pleasant and interesting and give you a summer meeting that you will never regret having."

WE desire to acknowledge the receipt and to express our thanks for a number of handsome and tastefully gotten up calendars received from Alfred F. Moore, manufacturer of insulated electric wire, 200 North Third street, Philadelphia, from the Western Electric Company, New York, and from the Warren Electric & Specialty Company, Warren, O.

The following members were elected at the 201st meeting of the New York Electrical Society, held on the 17th inst: J. L. Kruger and Frank H. Roth, Brooklyn, N. Y.: George H Watson and Joseph Hoffman, New York City.

## Proposals Invited.

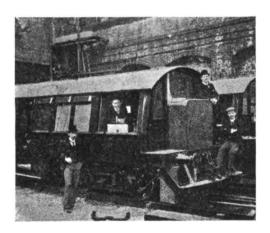

The Supervising Architect of the Treasury Department is inviting sealed proposals until February 10 for all the labor and materials required for fixing in place complete the conduits, electric wiring system, telephone conduits, electric pump, etc., in the U. S. Court House Building at Norfolk, Va. Prospective bidders desiring specifications and drawings may obtain same upon application to James Knox Taylor, Supervising Architect, Washington, D. C.

## AN UNDERGROUND RAILWAY OF LONDON.

In view of the early prospect of an underground electric railway for New York City the following description of the Waterloo & City Electric Railway that has been in operation in London since July, 1898, and for which we are indebted to the "Electrical Review," London, will be found both timely and interesting:

The steam-raising plant consists of five Paxman "Economic" steam boilers, each fitted with a Vicars' patent mechanical stoker, with suitable engine, shafting and pulleys for working the same.

The boilers are 14 feet long x 8 feet diameter and each is fitted with two flues (2 feet 8 inches diameter), and provided with two circulating tubes. There are 92 smoke tubes of 3 inches external diameter. The heating surface is about 1,180 square feet, working pressure 160 lbs. per square inch, hydraulic test 260 lbs. per square inch. Each boiler will evaporate 7,500 lbs. of water per hour. Each flue is provided with Paxman's patent expansion boiler flue, the form of which gives it such strength, that

FRONT VIEW OF MOTOR CAR, SHOWING CAB.

thinner plates can be used in the construction than it would be safe to use in the plain flue. This is a great advantage, as it is a well-known fact that the heat passes more rapidly through thin plates, which are thus rendered more durable, because they do not become overheated. In this way the full excellence of the materials is retained for a great length of time. The strength and durability of a boiler depend greatly on there being proper provision for expansion and contraction. When this is not provided for, furrowing and ripped seams are the inevitable results. Paxman's patent expansion boiler flue provides completely for this, without injuring its efficiency as a stay. The flue is made up of a series of short lengths, which are made of fine, soft and exceedingly tough steel. The plates are bent in such a way as to be when finished perfectly cylindrical, thus adding to the strength of the flue. They are then carefully welded, after which the ends are heated in a suitable furnace and enlarged in a powerful flanging machine in such a way that the end of one plate fits exactly within that of the next; the holes are then drilled through both and riveting completes the work. Both the laps, or doubling of the plates at the seams, as well as the rivet heads are removed from the line of draught and consequently escape the scouring action and intense heat of the gases as they pass along the flue. Flues made on this principle have withstood severe tests most successfully, and the collapsing strength is almost doubled.

The generators consist of six Belliss T.E.C.4 high speed, vertical engines, direct coupled to a two-pole direct current generator of Siemens'

bined sets at full load is 86.7 per cent., and at half load 81.7 per cent.

The train service is conducted almost entirely through twin tunnels, one for the "up" and one for the "down" service. The length

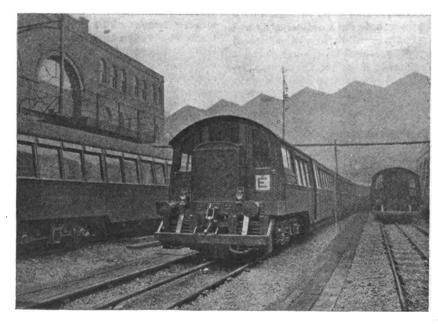

MOTOR BOGIE, SHOWING MOTORS AND COLLECTOR SHOE,

well-known type, each provided with a flywheel weighing about 6 tons.

The engines govern excellently, the momentary variation in speed being less than 4 per

from Waterloo Station to the City station, situated at the end of Cheapside and Queen Victoria street, is 1½ miles.

In regard to the line construction, the steel

ELECTRIC TRAINS IN SIDINGS AT WATERLOO.

cent. when the full load is suddenly taken off, and under 2 per cent. when the full load of 380 amperes is switched on after the set has been running light, the permanent increase of speed from full load to no load is only 0.8 per cent. The efficiency E.H.P. /I.H.P. of the com-

conductor rail, which is of channel section, weighs 39 lbs. per yard, and has a specific electrical resistance equal to eight times that of copper. It is carried on porcelain insulators, which are mounted on iron stalks screwed to the sleepers.

The insulated conductor rail is placed between the two running rails of the permanent way. It is laid in 30 feet lengths, these being connected by copper bonds of 1.5 square inch section, the bond serving the double purpose of fishplate and electrical connector. The copper rivets by which the bonds are attached to the channel steel are expanded into the rivet holes under hydraulic pressure, so that the electrical resistance between the surfaces in contact is negligible.

The running rails, which are used as the return path of the current, are bonded with copper bars of 1 square inch section, which lie outside the fishplates, and are connected with the rails by coned copper rivets in a manner similar to the bonding of the conductor steel.

The feeders and central conductor for the "up" and "down" lines are independent of each other, and accidents occurring on one line (r tunnel do not affect the supply of current to the other. The tunnel lighting is effected by an independent system of feeders and mains while the train lighting is managed from the circuit supplying power to the motors, the track rails being used for the return. A motor carriage is at each end of the train with two trailers between them. The former have collector shoes. There are two four-wheeled bogies to each carriage, and on one bogie of each motor carriage there are two Siemens' series wound motors. The motor armatures were built directly on the driving wheel axles, the field magnets surrounding them being fixed in position, so that they move in a horizontal plane with the bogie, but cannot rotate. No reduction gearing is employed.

Each motor carriage has its driver's cab, shown in one of the accompanying illustrations. Here there are fitted up a Siemens series-parallel controller, brake regulators, an automatic cut-out for 600 amperes, and gauges for indicating the current, voltage, air pressure and speed of the train. The height of the interior of the cab is rather less than that of the passenger coaches, the floor being raised 16 inches to give room for the motor on the bogie below.

The controllers and motors at each end of the train are connected by rubber-insulated cables laid along the roofs of the cars. The coupling used for connecting these cables has 13 distinct sets of contacts, separated from one another by "stabilit" insulators. The two halves of the coupling are bolted together, and pressure is put on the interlacing contact pieces by tightening the screws at the ends of the co inling.

One of our photographic views shows a motor bogie with two motors and collector shoe on the front end. When the photograph was tiken the car was jacked up to allow for the removal of the bogie.

Messrs. Siemens Bros. & Co. were the contractors for the entire electrical equipment of the Waterloo and City line. Mr. D. Heap is the resident electrical engineer at the generating station.

## Telegraphy on the Yukon.

A special dispatch from Skagway to the "Oregonian" of Portland, Ore., states that the first experiment in the far north in winter telegraphy over a modern line is to be watched with interest, now that the Arctic winter is on. Since the advent of the cold season, the wires between Ogilvie and Dawson have been down the greater part of the time. The first time they went down it was more than a week before they were restored. Whether they were

not given slack enough in the summer to al low for construction under the extreme cold, or what is the true cause of the trouble, is not

The receipts of the line the first two months of its operation, October and November, were \$13,000. One day this month \$400 worth of business passed through the Skagway office. Messages of commercial nature come and go not only between the States and Lower Canada, but also Germany, France, Belgium and even New Zealand. So far as possible, connections in the United States are made with the Postal Telegraph system.

The line to Dawson cost \$250,000. Next season it will be connected with the outside world by a line to be built north from Quesnelle, and for which an appropriation of \$350,000 has been made by the Dominion Government. Communication with the outside world will then be reduced to minutes or seconds. Now it requires four or five days for messages to be carried by steamer to Puget Sound after they reach Skagway.

#### THE STEAMSHIP OCEANIC.\*

The steamship Oceanic is at present the largest steamship afloat, having a total length of 704 ft. and a displacement of over 30,000 She has been built and luxuriously fitted for the White Star Company and runs between New York and Liverpool. As may be gathered from the following particulars, the electrical installation of this ocean greyhound is very complete. The generating units are four in number: the engines, which are of the compound twin type, have cylinders eleven and eighteen inches diameter by eleven inches stroke, driving direct dynamos with an output of 100 volts 600 amperes at a speed of 240revolutions per minute. The dynamos are compound wound, of the four-pole type, with two sets of brushes. Absolute steadiness of light has been ensured by exceptionally heavy flywheels. Each dynamo has a capacity for 1,000 16 cp. incandescent lamps, the aggregate of 4,000 lamps being as large as that of many small central stations on shore. Two engines and dynamos are on the starboard and two on the port side, being separated by a central bulkhead. By closing a watertight door in this bulkhead the two compartments can be isolated, so that in an emergency the two pairs can be worked quite independently of each other, thus minimizing the risk of a failure of the entire installation. There are two switchboards, one in each dynamo room, constructed so that one or more of the dynamos can be run in parallel or, if necessary, entirely separate. The power and lighting circuits are connected to separate 'bus bars, rendering it possible to connect one or more dynamos to the power and heating circuits whilst the others run the lamps; or, on the other hand, the power and lighting circuits may be paralleled. In practice it is usual to run the whole day-load in parallel on one or two machines, whilst at night two machines are run in parallel on the lighting and another independently on the power circuits.

All the switches on the boards are of the quick-break type, and the main dynamo switches are provided with auxiliary equalizing contacts to prevent a reversal of polarity. Each board has a voltmeter of the illuminated dial type with volt divisions between 83 and 120 volts, and can be connected by a four-way

switch to either light or power 'bus bars, or to either of two dynamos. There are also four ammeters of Evershed's circular marine pattern reading to 700 amperes, one for each dyna-The ammeters are in circuit with the return cables, which are connected to the ship's hull through massive gun-metal castings bolted to a steel bulkhead. This arrangement has been found advantageous with compound-wound dynamos running in parallel. The main dynamo fuses are of 1 x 0.013 tinned copper, and are covered by hinged plate glass shields. The circuit fuses are of stranded No. 33 tinned copper wire, and their sizes and descriptions of circuits are engraved on corresponding brass name-plates.

The wiring of the ship has been carefully planned to ensure that the lamps in the saloons, libraries, smoke-rooms, emigrants' spaces, and in fact all the principal accommodation, receive current from at least three independent circuits. This arrangement is to guard against total extinction of light should one circuit be put out of action through a main fuse blowing or from any similar cause. One of these circuits runs on the portside, the other on the starboard, and the third feeds police lights, which in small groups remain burning all night when the other lights are switched off. There are 28 circuits in all.

The wiring is carried out on the distribution fuse box system, there being on the different circuits over 100 distribution boxes, some single pole, others double pole; those for the engine rooms are of cast iron, and in the boiler spaces of cast brass, whilst on the decks they are of teak. The boxes for the saloons and the engine room contain, in addition to fuses, switches for controlling groups of lights. The fuses themselves are mounted on detachable porcelain bridges, which can be quickly replaced. There are no isolated fuses. The wiring is on the single wire system and the fittings make "earth" to the skin of the ship through concentric blocks. In the vicinity of the compasses, however, and in the elaborately decorated saloons, where direct attachment to the steel hull is not advisable on account of its inaccessibility, the return cables are taken to double-pole distribution boxes and the 'bus bars connected to the beams by # in. brass terminal screws. Three types of cables have been employed, those in the engine room of vulcanized rubber, lead-covered and armored, having a minimum insulation resistance of 2,500 megohms per mile, and these are clipped to the bulkheads. On exposed decks the cables are lead-covered and braided, whilst elsewhere ordinary vulcanized and braided cables are run in teak casing. The fittings and electroliers generally are of brass, gold-plated, silverplated and bronzed, except in the emigrants' quarters, where they are of cast iron, with massive hinged covers, which are closed when cargo is carried.

The total number of lamps installed is 1,975, of which some 350 are fixed in the engine and boiler rooms, whilst the motors, heaters and other apparatus demand current approximately equal to that taken by the lamps. The illumination of the stained glass domes in the libraries and smoke rooms is effected by inverted 32 cp. incandescent lamps on the principle sometimes adopted with arc lighting.

A large proportion of the first class staterooms on the upper and promenade decks are electrically heated. The radiators absorb from 74 to 10 amperes each at 100 volts, and the switches controlling them have four positions

<sup>\*</sup> From the "Electrician," London.

of contact—viz., one-third, two-thirds, full-heat and off—so that the temperature of any room can be regulated to a nicety by its occupant.

The fan motors are of the enclosed watertight design, direct coupled to centrifugal fans, and move each 11,000 cubic ft, of air per minute at a water pressure of  $\frac{1}{2}$  in. Their output and speed can be varied by means of multiple contact rheostats in series in the armatures.

The stores hoist motor, on the other hand, is of the semi-enclosed type, and is operated by a controller of the construction usually associated with traction work. The motor gears by worms and wheel to a drum, and is reversible in direction of rotation, whilst a magnetic switch cuts off the current automatically when the rope has reached two predetermined positions. Simultaneously it closes a low-resistance circuit across the armature terminals as a brake. The signal lamps are protected by an automatic indicator which, when a lamp burns out, brings into play a second one, at the same time calling the officer's attention to the fact by ringing a bell, lighting a red lamp, and dropping the corresponding indicator shutter.

The fog whistles are actuated by a magnet relay and time mechanism, which causes them to blow for a few seconds at regular intervals. thus avoiding continual personal operation during a fog. These last-named novelties, as are also the cooking apparatus, which comprises griddle cake plates, coffee heaters and hotwater urns, are of American origin. The bell installation includes 1,130 pushes and 15 separate indicators, each so fitted with a singlestroke and trembling bell that either can be switched into action. The single-stroke bell is used at night, and the trembling one during the day. Multiple change-over switches are also employed for transferring groups of rooms from one indicator to another.

## RECENT ADVANCE IN PHYSICAL SCIENCE.\*

BY JOHN TROWBRIDGE, S. D.

Scientific investigation in the department of physics for the year 1898-99, has very little to show that may be considered epoch-making, such as the work of Rayleigh on argon, and the discovery of the X-rays by Roentgen. Nevertheless, there are many interesting developments in mines already opened. The international yacht race has brought forcibly before the American people Marconi's system of wireless telegraphy; and one finds much literature on methods of communicating between stations which are not connected by wires. Marconi has shown that it is perfectly practicable to send messages by the Morse alphabet by means of electric waves over distances of between 30 and 40 miles. These messages are not impeded by fog or bad weather, and the waves apparently pass through hills and through walls of masonry. We say apparently, for it may be that such long electric waves roll around the surface of such obstructions very much as waves of sound and of water would do. It was demonstrated that Marconi's system will prove of use in communicating between ships at sea and between lightships and the shore. It is not yet possible, however, to send the messages in a definite direction, or in other words, to individualize the calls. Every one within the radius of 30 or 40 miles can obtain the wireless messages; and any one by erecting a tall pole,

provided with a wire with simple apparatus for producing electric sparks, could have confused the messages on the occasion of the last vacht race.

The outlook for wireless telegraphy at the close of the year 1899 did not, seem very exten-Until some method is discovered by means of which electric waves can be directed, wireless messages will be of little aid in obviating collisions at sea in a fog: for information in regard to the course on which a vessel is sailing is of no use unless the bearing of the vessel can be determined. This bearing would be given, if the electric waves could be received only in a definite direction. It is said that an English inventor has succeeded in steering a torpedo boat from a distance by means of electric waves. These waves set in action a relay circuit by means of which the rudder is turned in one direction, and when the waves cease, a mechanism reverses its movement. The practical applications of such waves have led to renewed interest in their study. G. V. Maclean, in the Jefferson Physical Labratory of Harvard University, has measured their wavelengths in air, and has determined their velocity (which is almost exactly that of light) to be 180,000 miles a second. It is interesting to reflect that before we hear the crackling sound of lightning, the electric waves excited by the discharge have traveled many hundred miles. One of the desiderata in the subject of electric waves is a more efficient method of producing rapid electrical sparks. The practical method of exciting them at present employed in wireless telegraphy is to suddenly interrupt an electrical current by mechanical means. Great interest has been excited during the year 1899 by a chemical interrupter called the Wehnelt interrupter from the name of the discoverer. It consists of a plate of lead and platinum wire, both immersed in dilute sulphuric acid. An electrical current enters the acid by the wire and leaves by the plate of lead. The bubbles of gas given off from the point of the wire suddenly interrupt the flow of the electrical current for an instant. This interrupter is placed in the primary circuit of a Rhumkorf coil, and a torrent of sparks is produced in the secondary of this coil. The reader will understand that this same Rhumkorf coil consists merely of a coil of coarse wire, through which the electric current flows in an intermittent way, and a coil of fine wire which surrounds the coarse coil. The intermittent action of the current in the coarse coil excites sparks between the ends of the wire of the fine coil. Many papers have appeared on the Wehnelt interrupter and several modifications of it have been suggested. It unfortunately requires considerable energy to set it in action. What is needed in wireless telegraphy is high electromotive force and a quick disturbance of the ether. Some success has been obtained by the use of the Wehnelt interrupter in wireless telegraphy.

The subject of the X-rays is closely connected with that of wireless telegraphy, for it is only another manifestation of electrical impulse or waves. The same energy which is manifested in the form of electrical sparks, and which generates electrical waves sufficient to effect electrical instruments 30 miles from the Rhumkorf coil in which the sparks are excited, is also capable of producing the X-rays in a vessel exhausted of air. While the waves which are instrumental in wireless telegraphy are between 3 and 4 feet long, those that are supposed to characterize the X-rays are less than one one-hundred thousandth inch in length. When

the spark which is competent to excite the long waves of wireless telegraphy is discharged through a rarified space, the peculiar pale yel-" low light of the thus excited Crookes tube appears, and it is no longer possible to send messages to a distance. In place of these messages there is given information in regard to the recesses of the human body, and various molecular movements are called into action which, if properly interpreted, would disclose to us some of the inmost mysteries. The investigation of the X-ray phenomena has not been very active during the year 1898-99. Various attempts have been made to prove that these waves are due to very short waves of light. No one has yet obtained conclusive evidence of this, H. Haga and C. H. Wind believe that the length of the wave is below one one-millionth inch, and M. Maier gives a similar estimate. When we reflect that wavelengths of the luminous portion of the solar spectrum are in the neighborhood of one fiftythousandth inch, we can form some conception of the small size of the waves which penetrate the flesh and throw shadows of the bones.

The practical use of the X-rays has steadily increased, and every hospital now makes use of them to determine the nature of fractures of bones of the extremities of the human body. Unfortunately, not much advance has been made in the use of the rays to study the thicker portions of the human body. The practical range of the rays remains much as it was when Roentgen made his discovery. Skilled observers, however, can now study the progress of disease in the lungs and can investigate the movements of the heart. More use is being made daily of the X-rays in dental surgery. The method employed consists in placing sensitive films, protected from moisture, in the mouth, and in exposing them to the rays which emanate from the Crookes tube situated outside the mouth. X-ray shadows of the teeth and jaw are thus thrown on the sensitive films. Many severe burns have been caused by the exposure of the flesh to the X-rays. The effect seems at first to be like a severe sunburn, but the injury is much deeper seated and the injurious action is progressive; it seems to attack the organs of nutrition of the tissues, and in many cases is very serious. The action can be prevented on the hands by wearing leather gloves or by interposing a sheet of cardboard covered with powdered aluminum which is connected by a wire to the ground. The most surprising development of the X-rays is in the discovery that they are given off by various substances, such as the salts of uranium and certain compounds from pitch blende. These substances have been classed under the name of radioactive substances, and certain of them in the form of powders, strewed on cardboard, can penetrate substances opaque to ordinary light, like wood, thin sheets of metal, etc., and can throw shadows of the bones of the hand on photographic plates. Indeed, they can produce all the phenomena of the X-rays, including the lighting of fluorescent screens, the dissipation of electrical charges, and the rendering of air or gases better conductors of electricity. It would certainly be a strange development in the study of the strange Roentgen light if the costly glass tubes, the induction coils for producing electrical discharges in these tubes, the batteries or dynamo machines should all be discarded, and if simple powders strewn on cardboard should come to suffice for locating bullets in the flesh or determining the nature of the fracture of bones.

<sup>\*</sup> From the "International Monthly," January, 1900,

Although we have not reached yet this praccal development by the study of radio-active substances, we have greatly extended our conception of the nature of radiations, visible and invisible. One of the most mysterious features of the radio-active system is the power to emit the X-rays, without apparent loss of energy. They resemble magnets in exerting an effect without apparent diminution of their original strength. A certain sulphide has been obtained from pitch-blende, which is more than 400 times as active as the uranium earth which was first studied. This sulphide has been called polonium, and it is supposed to be a new metal. It is not characterized by new spectral lines which can be identified. This, however, can also be said of uranium, thorium and tantalum, which give very few lines in their spectrum.

Much interest has been awakened by the production of liquid air on a large scale, and various popular articles have appeared in American magazines describing remarkable experiments which have been performed by the aid of it. The articles have been as remarkable as the experiments, and certain loose statements have led to the hope that liquid air may have a commercial future. These hopes have not yet been realized. The greatest use of liquid air seems to be in scientific investigation; by its aid Prof. Ramsey has added neon and metargon to the list of new gases. These gases were obtained by a species of fractional distillation of liquid air. The residue, after a certain duration of the evaporation, was examined, and in this way the lighter constituents of the air were separated from the heavier.

Spectrum analysis still continues to be a powerful method of investigation. In the hands of Prof. Crookes it has added a new metal to the list, of known metals. Prof. Crookes has called it victorium. The metal was obtained from the rare earth, yttria. In the Jefferson Physical Laboratory of Harvard University, instantaneous spectra of gases have recently been obtained. Formerly it was necessary to expose sensitive plates for several minutes in order to obtain a negative of a gaseous spectrum. It is now possible to obtain such negatives in less than a thousandth of a second. The heat of the electrical discharge which is employed for this purpose is far beyond that previously obtained, and it seems possible to study under very favorable conditions the types of spectra presented by the stars.

Rubens has continued his interesting investigations of the red end of the solar spectrum, and by repeated reflections of heat waves from surfaces of quartz and the mineral sylvine, has succeeded in isolating very long waves of heat. Prof. Langley, who is also continuing his investigations of the red end of the spectrum, has succeeded in rendering his measuring instruments 400 times more sensitive than the form he previously employed. The progress in photography may be said to be in the direction of the red end of the spectrum. The ordinary dry plate is sufficiently sensitive to the blue and violet rays. It is now possible to obtain plates which will also give the red, yellow and green of the spectrum, and the steady improvements in photographic processes leads one to hope that color photography may soon be realized. The increasing perfection of biograph pictures, and the improvement in microscopes, by means of which study of bacilli has been made possible, testify to the advance in the art of making lenses. Prof. Michelson has

described a new spectro-scope for the minute study of portions of the spectrum. It is competent to widely separate lines which seem single into doublets and even triplets—in one sense, to perform the function of a microscope for the spectrum.

The student of light has been much absorbed by investigations of a singular action of magnetism upon light discovered by Zeeman. If the source of light is placed between the poles of a powerful magnet and is examined in the direction of the lines of magnetic force and also in the direction of right angles to these lines-remarkable differences are observed in the character of certain lines in the spectrum of the light. What were considered single lines become doublets and triplets, and a new method of analyzing vibrations of light results from the discovery of this phenomenon. The experiment supports the view of the electro-magnetic nature of light, and the result was predicted by Lorenz from a mathematical discussion of the electrical theory of light. Rhigi has also found that light is absorbed in a peculiar manner when the source is placed between the poles of a magnet. The student, in reviewing the work of the year on the subject of light, can see that the theory that light and heat are electrical phenomena is steadily growing in importance.

The rise in the price of copper has led to renewed interest in the metal aluminum as a substitute for copper, and it is being employed on a large scale. At Niagara Falls, great conductors of aluminum are used to transmit electrical currents from the power house to the works. These conductors are aluminum bars. 25 feet long, 6 inches broad and 1 inch thick; four of these are riveted together at the ends, and each group of bars is connected to aluminum cables: the core of each cable is about 14 inches in diameter. The amount of aluminum in the conductors is 22,000 pounds. The same work in copper would require 48,000 pounds. The conductivity of the aluminum compared with copper is 63 per cent., but for the same weight it is nearly double. Aluminum cables require more insulation, but enable longer spaces to be used, thus reducing the number of poles and insulators. No practical method, however, has been discovered of soldering together bars or wires of this metal, and this fact is a serious obstacle to its rivalry with copper. The size of the cable in telephone circuits would be largely increased if aluminum were employed, and an obstacle would thus be created to the perfect transmission of speech, for the electrical capacity of the line would be greatly enlarged. If aluminum should take the place of copper, most of the tools and mechanical appliances now used for working copper and brass would have to be modified or changed, and this would lead to great expense. Aluminum, however, is much affected by moisture and by the salts contained in water and in soils. It has been discarded in the construction of yachts, especially in those parts liable to be wet by salt water. Attempts have been made to construct storage cells from aluminum in order to take advantage of its lightness, but the results have not been successful. The disintegration of aluminum by liquids seems to be an effectual bar in this direction.

The progress of the practical uses of electricity continues to be a marked feature of the times. This progress is remarkable in the direction of the employment of alternating currents of electricity instead of steady or direct currents. The latter can not be transmitted

without great loss or great expense from one station further than 5 or 6 miles. A to and fro current, on the contrary, can be sent 30 or 40 miles, or even farther, and can be transformed into a direct current at the receiving station. This transformation is necessary at present, for the electric motors on street, railways, are adapted for direct currents. This use of to and fro or alternating currents has led to the utilization of water power on a great scale. During the past year there has been much discussion of this comparatively new field in electrical engineering, and the technical journals have contained many articles on what are called polyphase motors and the transmission of power by their means. The student of the applications of electricity must evidently devote himself assiduously to this new branch of the subject, for it contains far greater possibilities than the old method of direct currents. The subject is a difficult one, both from the side of theory and experiment, and to thoroughly digest the literature which has appeared during the last year on the subject of alternating currents would absorb the entire attention of a competent student. When one reviews the progress of physical science in America one must. follow the practical applications of this science; for the employments of electricity on a large scale bring to light new phenomena or shed powerful light on old ones.

In theoretical physics the most striking hypothesis has been enunicated by Prof. J. J. Thomson on the size of atoms. His remarkable investigation of the action of the X-rays on gases has led him to believe in the existence of masses smaller than the atoms. Several lines of research enabled him to determine the ratio of a mass of the atom to the electrical charge carried by the atom. This ratio was found to be about one-thousandth of that calculated from previous determination by physical chemists on the lines of the old hypothesis of the size of atoms. He therefore investigated the question whether the atom carried an electric charge greater than is reqired by the laws laid down by Faraday, or whether the charge is carried by only a portion of the atom-in other words, whether a small fraction of the atom which carries a negative charge can be separated from its mass. From his experiments Prof. Thomson concludes that ordinary electrification consists in the removal from the atom of a smaller atom or corpuscle negatively charged, leaving the remainder positively charged. Attraction and repulsion merely consist then in a surplus in any point of the mass of an atom, or a deficit. This hypothesis. makes the mass of an atom a variable quantity instead of an invariable one. Prof. Thomson believes that his view is supported by evidences from spectroscopic observation. A careful study of his researches and of those of his students will convince one that the most brilliant work in electricity and the X-rays has been done in England during the year now closed. One is struck, however, by the fact that the X-ray phenomenon has broadened so far as to include the subject of the ultimate constitution of matter.

#### The Ft. Wayne Electric Light Works.

Superintendent J. J. Wood of the Electric Light Works at Ft. Wayne, Ind., recently said that the sales of the factory's product had averged \$17,000 per week from the day the plant was opened up under the new company to the present time. Considering that at first but forty-five men were employed the number being gradually increased, an average of \$17,000 weekly means that since the works have been run with a full force the sales must have been very great. In fact, some weeks the sales aggregated as high as \$28,000. The men at the works are very busy, indeed, and there is a general aspect of prosperity about the plant.

## THE FUTURE OF ELECTRIC ILLU-MINATION.

#### BY JEAN WETMORE.

#### PART IV.

In preceding articles we have briefly reviewed wires, insulation, conduit tubing and the effects of Underwriters' regulations toward producing an increased cost and the complexity of present electrical practice viewed from an independent vantage ground and in the light of future improvements.

We now consider light producers and find that the contest between electricity and gas to be more evenly balanced when all the advantages and disadvantages are considered.

The arc lamp, one of the most efficient and cheapest of electric light producers, must be fed by a heavy No. 6 wire of copper at 164 cents per pound; its light rivals the sun for purity and penetration, but it finds its principal uses restricted to out door work and in lighting large interiors, its machinery is expensive, and complicated to construct, with its main regulating coil, shunt cut out, rods, levers, springs, cogs and clutches, heavy frame and supports and its ever consuming and constantly renewed carbons, that cost money from night to night; then come the repairs and fine adjustments, broken globes to renew and to keep clean.

All these items do not well compare in economy and attention with the refractory mantles over Argand burners, that are coming so plainly in evidence lately in street lighting.

For the smaller more diffused light we have the incandescent lamp, with its yellow, dim light in an often smoky glass bulb, containing often a barely red hot hair pin of fragile filament, of inconstant durability and constantly decreasing efficiency, trying hard to do its duty in an uncertain vacuum.

We can not turn the light up brighter or down lower and save expense.

With this lamp as with the arc it is the whole thing or nothing—no intermediate graduations or house wifely economy.

How do these two classes of electric lamps compare with the brilliant white light of the lately improved refractory mantles, two for twenty cents, that last a year, and a burner that is practically indestructible?

Then there are the improvements that are coming along, such as automatic lighters and no matches used; improved mantles that nearly double the amount of light with the same gas consumption; while we have no improvements in the incandescent glow lamps since the Westinghouse Company used a glass stopple to evade the Edison patents, a mere makeshift with no light producing increase.

Vacuum tubes have so far proved to be practical delusions, and the Nernst lamp has only given some erudite professors an opportunity to make themselves conspicuous by their learned dissertations.

We seem to be at the end of our string, and we are face to face with the fact that the gas

men have been silently stealing a march on us.
What must we do to be saved? Where is the
Moses to lead us out of the wilderness?

When the National Electric Light Convention was held in St. Louis several years ago, we saw glow lamps made to burn without wire connections; has it never occurred to any one to use copper threads and make the idea a tangible commercial fact?

Why confine ourselves to our present heavy amperages, and expensive conductors, to carry a current that will melt anything that it will not consume, and will take human life if one gets in the way of it, when there are other forms of electricity, that produce light and like the biblical burning bush, that burns and is yet not consumed.

We should convert our amperes that are so expensive to carry about into volts that do not have to be carried on or in anything, but would run around without any substantial props, the kind that have millions in them, that are beyond the jurisdiction of the Fire Underwriters, and are life givers and microbe killers, instead of human life takers and insulation requirers.

If properly utilized we have enough scientific facts about these highly attenuated forms of electricity chopped out by our non-practical investigators and posers for notoriety in the Sunday editions of the sensational press, to make the gas people sore afraid, and cause them to be buried in commercial oblivion.

Our great investigators should not spend the hard earned increment of our gullible millionaires trying to send motive power to London or Paris by means of the Aurora Borealis from the summit of Pike's Peak, or fritter away their time teaching the inhabitants of Mars the English language, when we are in need of an electric light that requires no carbon consumption, no machinery, no vacuum surrounded by glass bulbs; but a lamp that produces a white, pure light, without heat, or air consumption and does not require a copper rod as large as a marlin spike to feed it.

Do they not know that the price of copper gas gone up, and that the gas trusts are making the electric men feel melancholy?

(To be continued.)

## American Institute of Electrical Engineers.

The 139th meeting of the Institute will be be held at 12 West 31st street, New York City, this (Wednesday) evening at 8 o'clock, and a paper will be presented by Chas. P. Steinmetz, of Schenectady, entitled "Notes on Single-Phase Induction Motors and the Self-Starting Condenser Motor."

A paper will also be presented by Fitzhugh Townsend, of New York City, on "A New Method of Tracing Alternating Current Curves."

Applications have been received from the following candidates for associate membership, which will be acted upon by the Executive Committee at its meeting February 28:

H. S. McVay, Wichita, Kan. George L. Wiley, New York, Morris M. Menrath, Chicago.

J. L. McCreary, L. W. Henry, C. W. Evans, J. M. Zapata, H. H. Barnes, Mexico City, Mexico.

F. O. Renstrom, Pachuca, Mexico.

M. L. Schiaffino, Guadalajara, Mexico.

A. M. Hunt, San Francisco, Cal.

W. G. Lawrence, Hudson, Mass.

W. Eugene Smith, Philadelphia.

John D. Boyd, Marysville, Cal.

## NORTHWESTERN ELECTRI-CAL ASSOCIATION.

PROCEEDINGS OF THE EIGHTH ANNUAL CONVENTION HELD AT MILWAUKEE.

Fair Attendance and an Interesting Programme-The President's Address—Carcfully Prepared Papers Read and Discussed-Mr. Norcross Elected President.

The Eighth Annual Convention of the Northwestern Electrical Association was held at the Hotel Pfister, Milwaukee, Wis., on January 17, 18 and 19.

FIRST DAY'S SESSION—WEDNESDAY, JAN. 17.
The Convention was called to order at 11 o'clock by the President, Henry L. Doherty.

The minutes of the last Convention were accepted as printed.

The Committee on By-Laws, Prof. D. C. Jackson, chairman, submitted a long report, which was debated at considerable length.

#### President Doherty's Address.

The President then delivered an interesting and lengthy address, in which, referring to the progress made during the last year in central station appliances, he said:

"The progress made in steam and electrical appliances has been all that could be reasonably expected, even though not all that might be desired. The most substantial progress in all lines has been towards the improvement of former developments, by the lessons of experience and better mechanical work. The steam turbine has been Americanized and bids fair to supersede, in a great measure, our present engines. Experimental work has indicated a marked economy of steam consumption with other desirable advantages. American built high speed engines, capable of being directly coupled to arc dynamos, are in successful operation, and steam economy equals most modern multi-expansion engines. The older types of engines have nearly all been greatly improved in detail, and there is a constant tendency for smoother running and better regulation. The exploitation of the electrical business has done much toward the development of steam prac tice. While there have been no marked improvements—except, possibly, for the steam turbine and the higher speed engines-the general operating results have been materially bettered.

"The constant current transformer is here to stay, and street illumination by series alternating enclosed arc lamps seems to be a decided improvement over the old series continuous current open arc. The distribution of light is very materially improved, and the serious objection to the old open arc of lack of uniform illumination has been partially obviated.

"Gas engines are now being built with satisfactory regulation and of any desired size. Two central stations, to the writer's knowledge, have adopted them as prime movers, and have selected sizes as high as 650 B.H.P.

"Aluminum wire is already in satisfactory use as a substitute for copper conductors, and, in view of the inflated price of copper, it would seem advisable to use aluminum as much as possible, to assist in bringing the price of copper to a more reasonable figure.

"The use of exhaust steam for heating neighboring buildings, either by its direct transmission or by the circulation of hot water, is being adopted by numerous plants. The Programme Committee has provided for a care-

, y -

ilar.

ilian

1.7

[en

(đíc

C F

ful consideration of this matter, so I shall not dwell longer on this subject, although one of great importance.

"The distance and high voltage limit of transmission is being constantly increased, and one of the recent plants exploited will transmit current for an extreme distance of 155 miles at 60,000 volts. Two installations will be made during the coming year of 25,000 volt cables underground."

The causes tending to retard development were enumerated as follows:

- "The average central station is handicapped for the following reasons:
- "First—Improper and insufficient education of operators.
  - "Second -Poor accounting.
  - "Third-Lack of capital.
  - "Fourth-Inequitable rates.
- "The ultimatum of perfection in central station operation requires education in all branches of engineering, accounting and business methods. Good judgment and diplomacy are such necessary attributes that their mention here would be superfluous.

"Unfortunately the American people are too easily influenced by the statements of well known men, and read and accept their views without stopping to consider whether they are competent to know whereof they speak. Two well known financiers have, during the past year, stated that the young man of to-day is over-educated, and we now hear much about so-called super-education. I think this idea has taken greater root amongst central station men than any others. All of us cannot follow the vocation of financiering; and what special knowledge do these financiers possess of the needs of other vocations not known to others? Financiering is a profession-if it can be dignified by that term-requiring the same talent as required by a pawnbroker or a country storekeeper, and the testimony of a man with a reputation only as a successful financier should be no more quickly accepted on the merits of education, than on the technique of piano playing. These men unconciously aim to tear down all higher education for the sake of airing an unstudied whim.

"Education, in its broadest meaning, cannot curtail a man's ability; and, if modern education proves harmful, it merely renders present methods questionable, and, in turn, indicates lack of proper education in psychology, pedagogy and kindred sciences on the part of our educators. Public men occupy positions of great responsibility, and the expression of ill-considered ideas is a worse sin than simple indiscretion. True, higher education is the factor which promises to make the American nation supreme, and opposition to education in general dismantles the vehicle of progress.

"Perfection in the electrical business will never be made by following the advice of these accepted oracles, and placing ignorant men in positions of responsibility. Select employes with the usual requisites as to knowledge, truthfulness and judgment; but, by all means, when these talents are equal, choose the most highly educated talent the position will command. I would also recommend further education of present employes. Many correspondence schools are springing up all over the country, and I know some of them are good. The promoters of this method of education are doing a great philanthropic work. They may be unconscious of it, and are, undoubtedly, prompted by personal gain; but, nevertheless, correspondence schools bid fair to do much towards our progress, and have many advantages peculiar to themselves. They reach the man who wants an education, and the man who knows what kind of an education he wants. They reach the man who is probably engaged in the very work he is studying and his education and practical experience gc on simultaneously, and his work is apt to keep him interested in his studies. They place within the reach of all the means to take advantage of the opportunities that are apparent to them."

In concluding, President Doherty referred to the work of the Association in the following words:

"The Northwestern Electrical Association is experiencing a substantial and healthy growth, and is capable of doing much valuable work for the benefit of the central station business. Every central station in the Northwest has and will be benefited to a greater extent than the cost of membership in this Association and the sending of a representative to all of our conventions.

"While our membership is already large, there is no reason why it should not be trebled and an organized and earnest effort should be made this coming year to induce all central stations within our territory to join the Association. When our representatives go before a legislative body or a traffic association, their influence is proportional to the membership they represent; and the larger our membership, the more apt we will be to accomplish whatever reforms are undertaken, and the greater will be our confidence in undertaking new and important work.

"There are numerous other associations, and I sincerely trust that at no distant date a strong effort will be made for a closer relationship between these various associations, which will greatly increase the usefulness of all of them."

Wednesday—Afternoon Session.

The President called the Convention to order at 2:30 P.M.

The Secretary-Treasurer's report was read, accepted and placed on file.

The next order of business was the report of committees, and Mr. Norcross, chairman of the Protective Committee, said: "We have had fair success, but generally not very good, but we did better the last year. I beg to call your attention again to the fact that members of the Legislature paid no attention to whether our plants paid anything at all, the depreciation, income, outgo, etc., it never seemed to enter their heads, and I say nothing against them, but they said, 'Well, we will raise the tax on all electric lighting plants 2 per cent., and they were very much surprised when we asked for a hearing. Our Secretary mailed to each one of them a card or letter suggesting the propriety of giving the representatives of the electric lighting industry in this State a hearing, and to that is largely due the fact of our being given a hearing. I may say without conceit that the members of the different electric lighting stations who were present in Madison, had some influence in getting the Legislature to appoint this committee before whom we could appear or write, and bring to them the knowledge that we were entitled to some notice."

The report of the committee was accepted and placed on file, and the President appointed Messrs. Debell, Hammond, Livermore, Pearce and Frund, as a committee to investigate the matter of taxation and report at the next Convention.

The Secretary then read the following applications for membership:

Joseph M. Brooks, Chicago; Sangamo Electric Co., Springfield, Ill.; E. Kuhlman, Elkhart, Ind.; A. M. Barron, Elkhart, Ind.; Red Wing Gas & Electric Co., Red Wing, Minn.; Ernest H. Davis, Williamsport, Pa.: Varney & McOuat, Indianapolis, Ind.; F. S. Terry Chicago; M. E. Baird, Chicago; Chicago Insulated Wire Co.; S. T. Carnes, Memphis, Tenn.

It was moved, seconded and unanimously carried that the applicants be declared members of the Association, and the Secretary was instructed to cast the ballot of the Association for them, under suspension of rules, which was done.

Mr. R. Fleming, of Lynn, Mass., then read his paper on "Modern Development in A. C. Series Arc Lamps."

The paper was carefully prepared and elicited the remark from the President "that the subject is perhaps as interesting to central stations as any matter that could be brought up at this Convention."

On motion of Mr. Bean a vote of thanks was extended to the reader of the paper.

Prof. Jackson of Wisconsin University then read his paper on "Alternating Current Phenomena."

At the conclusion of the reading of his paper Prof. Jackson said: "Power factor can never be more than unity, because it makes no difference whether the current wave is in advance of or behind the pressure; we have still the volt errors, which if there is any difference of phase, are bound to be larger than the watt meter unit. So the power factor will always be unity or less."

The President—I expected that this paper by Prof. Jackson would contain a simple exposition of the subject, but a few Greek letters may have scared off some members who are not mathematical. But I had a chance to look this paper over, and it is really not hard to follow, but whether hard or not it is the easiest thing to follow I have ever seen on this subject, and it embraces some information that every alternating station man ought to know.

On motion a vote of thanks was extended to the speaker and the paper ordered published.

The President appointed as Committee on Nominations, Messrs. Copeland, Bragg, Kerns, Bean and Kountz; as Committee on Summer Meeting, Messrs. Lord, Frund, Gille, Bean and Kountz.

An adjournment was then taken to 10 A.M. January 18.

Second Day's Session—Friday, Jan. 18.
The Convention was called to order by the

The Convention was called to order by the President at 10 A. M.

A paper on the subject of "Central Station Heating in Connection With Electric Lighting Plants" was read by Mr. W. H. Schott, of Chicago.

President Doherty remarked that the paper read by Mr. Schott was of such importance that it should be thoroughly considered, and almost all the members participated in the discussion.

A paper was then read by Mr. W. H. Frund on "Central Station Economies," and like the preceding paper was found so important that nearly the entire morning was taken up with the discussion.

Just before adjournment at noon Mr. Mershon read a paper on "The Induction Motor." At the conclusion of his paper Mr. Mershon said: "As long as there is any relative difference of speed between disk and magnet, elec-

tromotive force will be generated and the current will flow in the elementary circuits shown. The question of power factor is not very complex, if you simply consider it as a ratio between the true power supplied through any piece of apparatus and the apparent power. The analogy between the static transformer and the induction motor is a complete one. We have the magnetic current of induction in the one corresponding to the magnetic action in the other; the action and reaction between the primary and the secondary are the same, and the drop is also the same."

An adjournment was then taken until 2 P.M. THURSDAY-AFTERNOON SESSION.

President Doherty called the Convention to order at 3 P.M., and the order of business of the election of officers was called for.

The Committee on Nomination of Officers recommended that the following be elected:

President-P. Norcross, of Janesville, Wis. First Vice-President-H. W. Frund, of Vin-

cennes, Ind. Second Vice-President-H. J. Gille, of St. Paul, Minn.

Secretary and Treasurer-Thomas R. Mer-

Directors-H. W. Schott, George D. Westover and Mr. Imass.

Mr. Livermore moved that the nominees of the committee be elected to the respective offices for which they are nominated, that the rules be suspended, and that the Secretary cast the ballot of the Association for them.

The Secretary cast the ballot as instructed, and the President announced that the nominees were duly elected to their respective offices.

The President-I request Col, Copeland and Mr. George Cutter to escort President Norcross to the chair and introduce him, if he needs it.

This was done amid great applause,

President Norcross-Gentlemen of the Northwestern Electrical Association. For a number of years last past this Association with rare good sense has selected for its Treasurer and Secretary one man who collects all the bills, pays all the debts, does all the advertising, duly advises us whenever a meeting is to be held, looks out for our comfort during the summer as well as the winter. Now, with such a Secretary and Treasurer I apprehend that notwithstanding my predecessor has spent a considerable amount of money, which I think he ought not to have done, that the office of president is to a considerable degree ornamental, though I count it no small honor to be selected as your presiding officer for the ensuing year, and I beg to extend to you my most hearty thanks for that honor.

Waupaca, Wis., and St. Paul, Minn., were the cities advocated for holding the summer meeting, and Waupaca was selected by a vote of 42 to 12.

It was decided that a committee of four, of which Mr. Lord of Waupaca is chairman, have the power for selecting the date for holding the midsummer meeting.

On motion of Prof. Jackson a committee of three was appointed to report a year hence upon the possibilities and advantages of central station companies taking an interest in the entering of their employes upon the courses in correspondence schools.

Prof. Richter of the University of Wisconsin then read a paper on "Relative Desirabil-'ity of Various Types of Engines on Central Station Loads,"

Mr. Marsh, in the absence of Prof. Shepardson of the University of Minnesota, read a paper by Prof. Shepardson on " $\Lambda$  Life Test of Incandescent Lamps."

The paper on the subject "A Canadian Plant," by L. G. Van Ness, of Quebec, Canada, was not presented.

An adjournment was then taken to Friday.

THIRD DAY'S SESSION-FRIDAY, JAN. 19.

The Convention was called to order by the President at 10 A. M., and there being no business before the meeting the Convention then on motion adjourned.

#### PERSONAL MENTION.

Mr. Adolph Theobald has been elected president of the Edison Electric Light Company at Columbus, O.

Mr. Marshall L. Barnes, an Alderman of Troy, has been elected vice-president of the New York State Association of Electrical Contractors.

Mr. Fenner VanAuken, of Allegan, Mich., has received an appointment to the United States Navy as an electrician. He served as first lieutenant of the Thirty-fourth Michigan in the Spanish-American war.

Prof. W.F. Durand of Cornell University has been awarded the first prize for the best technical essay submitted to the American Society of Naval Engineers for his paper on "Electrical Propulsion for Torpedo Boats." The prize consists of a substantial compensation, life membership in the society and a gold medal.

Mr. Frank C. Tryon, Jr., superintendent of the Huntington Electric Railway, died at his home in Huntington, L. I., January 15. He was twenty years of age, a native of New York, and one of the youngest men in the country to occupy so important a position.

#### INCORPORATIONS.

The International Commercial Incandescent Light Company, Allentown, Pa. Capital stock, \$200,000.

The National Power Company, Kittery, Me. ture and distribute electrical power. Capital stock, \$1,000,-000. President, W. E. Taft of Boston, Mass.; treasurer, F. E. Rowell of Kittery.

The Sussex County Gas Company, Newton, N. J.-to do a gas and electricity business. Capital stock, \$75,000. Incorporators: J. H. Avery, O. Congleton, both of New York, and H. G. C. Thompson, of Cranford.

The Kidder Motor Vehicle Company, New Haven, Conn. Capital stock, \$500,000. Officers: President, T. Attwater Barnes; vice-president, Hon. C. C. Colby; secretary. F. G. P. Barnes; treasurer and general manager, Charles R Bishop; consulting engineer, Wellington P. Kidder.

The Morgan Electrical Machine Company, Chicago, Ill.—to manufacture electrical goods. Capital stock. \$25,000. Incorporators: E. C. Morgan, D. B. Douglass and J. H. Barnard, all of Chicago.

#### COMMERCIAL PARAGRAPHS.

Mr. Oscar A. Michel, the well-known patent expert, whose offices in this city have heretofore been at 305-309 Broadway, has removed to more commodious quarters in the Vincent Building, 302-304 Broadway. How successful Mr. Michel has JULIUS E. SEITZ.
PRESIDENT & TREASURES.

## ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FORBIGN PATENTS, at 303 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than Afteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

## GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Alliance, O.—An electric light plant will soon be erected here.

Avon, N. Y.—At the annual meeting of the stock-holders of the Avon electric light plant it was decided to enlarge the plant.

Bedford, Pa.—The council has started a movement that may result in the adoption of electric are lights for street lighting.

Bloomfield, Conn.—It is safe to say that this village will have an electric light plant, despite the opposition by some of the citizens.

Braintree, Mass.—This town has appropriated \$26,000 for the purpose of remodeling the electric light plant.

Camden, Ill.—The village board has voted to put in an electric light plant.

Charlottesville, Va.—The Virginia Ice Company of which T. O. Troy is president contemplates the erection of an electric light plant at this place.

Clementon, N. J.—A census is being taken of the property holders of the town to determine how many would like to put electric lights in their houses, and also to find out what can be done about lighting the streets with the same

Cottonwood Falls, Kan.—Strong City and this place are to have electric lights and electric car lines.

Evanston, Ill.—The scheme of utilizing the surplus power at the waterworks for city lighting has met with approval by the aldermen. The committee on lights and lighting are to report to the city council not later than the second meeting in February concerning the fessibility of establishing a municipal lighting plant.

Eufaula, Ala.—J. W. Spencer has been instructed by the city council to investigate the cost of building and operating an electric light plant.

Friend, Neb.—The citizens of this place are agitating the question of building an electric light plant

Glenville, Neb.—The electric light plant at this place has been destroyed by fire, entailing a loss of several thousand dollars.

Hellertown, Pa.-The Thomas Iron Company has decided to put up an electric light plant at its two large furnaces and to light the buildings inside and outside by electricity.

Homer, Mich.—The village council has decided in favor of municipal ownership of the electric lighting

La Grange, Ga.—This city will hold an election February 1 to determine the issuance of \$15,000 of bonds for erecting an electric light plant.

Laurens, S. C.—The Laurens Laundry Company will soon install an electric light plant of about 20 lights and wants estimates, etc., from manufacturers.

Lostant, Ill.—This city contemplates erecting an electric light plant

electric light plant.

Madison, Ark.—J. W. Wheeler & Co. contemplate building an electric light plant at this place.

Malvern, Pa.—A project has been started to erect an electric light plant in this place.

McKinney, Tex.—The citizens are agitating the question of erecting a new electric light plant.

Monticello, Ark.—Bids will be received until February 10 by R. L. Hardy, secretary of the board of improvements in district No. 1, for constructing a complete system of electric lights.

North Wilkesboro, N. C.—This city has voted bonds for an electric light plant. Address L. Vyne.

Owensborough, Ky.—It is reported that the new city council will at once begin consideration of the electric light question, and a proposition will shortly be made for the erection of a municipal plant.

Port Washington, N. Y.—A stock company is to be organised here for the purpose of establishing an electric lighting plant.

Shamokin, Pa.—The citizens are contemplating the building of a municipal electric light plant.

Tate Springs, Tenn.—A large electric light and heating plant costing \$15,000 will soon be erected here.

Toocle, Utah.—McBride & Orme Brothers wish to increase the water power that they already have, with the intention of putting in an electric light plant, and supplying the town and surrounding country with better and cheaper light.

Union City, Mich.—The city council is discussing the matter of building a new electric light plant.

Webb City, Mo.—A subscription paper has been in circulation for the purpose of building a consumers' light plant. It is proposed that the citizens take stock and erect a plant, the city having the right to purchase it at any time. it at any time.

Westerly, R. I.—Messrs. Arnold, Price and Haswell, have been investigating the question of a town electric lighting plant. Plans are in preparation for a town lighting station.

#### STREET RAILWAYS.

Akron, O.—The long projected line between this city and Canton will be constructed next summer. W. A. Lynch, of Canton, is at the head of the project.

Branford, Conn.—The new electric line for this place is about to become a reality. Work will be begun early in the spring. The route will be by the shore. The terminal is to be at the power house in Mill Plain.

Collinsville, Ill.—The surveyors for the new electric railroad have lately been working near this city. The coad will be completed and everything in working

order by spring.

De Kalb, Ill.—The city council has granted a franchise to the Sycamore-DeKalb Electric Railway Company.

East Liverpool, O.—The scheme to construct a traction line from Beaver, Pa., to this place has been started. A company has been formed composed of H. C. Eagle, H. W. Reeves and C. E. Deens, of Beaver, who have applied for a charter to build the line. The capital will be \$75,000. The road will connect with the Beaver Valley Traction Company's lines at Vanport, Pa., and extend down the Ohio River to Wellsville, O., a distance of 23 miles.

Elkton, Md.—A project is on foot to have an electric allway between here and Chesapeake City.

Greenfield, Mass.—A movement has been started to build an electric railroad from here to South Deerfield, a distance of nine miles. John A. Taggart, Charles H. Keith, John Sheldon, Clifton L. Field, E. H. Hollister and D. P. Abercrombie, Jr., of Greenfield, are interested.

Houston, Tex.—The Houston-Oakland & Magnolia Park Railway Company has decided to rebuild its line for the use of trolley motors. A. Fuller is general manager.

Jersey City, N. J.—David Young, president of the Jersey City, Hoboken & Paterson Street Railway Company, says the company has been considering a plan to enter Hackensack from Lodi, in a northeasterly direction.

Kenosha, Wis.—Prospectors are laying out a line for an electric road between here and Waukegan.

Millville, N. J.—The Millville Traction Company has made application to the city council for permission to extend its line to Vineland.

Newport News, Va.-The Hampton Roads Railway & Electric Company proposes to build an electric railway from this place to Hampton and Old Point. A. H. Martin, W. J. Holms, R. W. Shield, C. F. Day and others are interested.

Schuvlersville. N. Y.-Surveyors have been looking electric railroad route between here and For The road is promised in the early summer.

St. Louis, Mo.—Special electric fureral cars to carry the dead, the mourning friends, the family and pallbearers to the cometery are to be introduced in this city. The St. Louis Funeral Transportation Company is the author of this innovation.

Tamaqua, Pa.—The Schuylkill Valley Electric Railway Company has received the right of way to build its line from this place to Port Clinton. Pottsville is the objective point. Work will be started early in the

## COMPANY MATTERS.

Bennington, Vt.-The Bennington & Hoosick Valley Electric Railway Company is about to erect a new power house, which will be placed on the banks of the Walloomsac River.

Cleveland, O .- The Little Consolidated Street Railway Company will build a \$40,000 car house next spring with a capacity of several hundred cars.

Charlestown, Md.—The Charlestown Electric Light Power plant has been sold to C. E. Ehrehart, of Han-& Power plant has be over, Pa., for \$10,150.

Columbus, O.—The People's Gas & E'ectric Company has increased its capital stock from \$50,000 to \$100,000.

Holland, Mich.—The car barn, eleven cars, and the freight motor of the Holland & Lake Michigan Electric Railway Company were lately destroyed by fire. Las,

Kansas City, Mo.—The new owners of the Edison Electric Light & Power Company of this city, will spend more than \$500,000 in improvements.

Lebanon, Pa.—The Edison Electric Illuminating Company of this place has received 175 street lamps of the highest candle power. The company will now rethe highest candle power. The company will now build its plant and add two large compound boilers.

Lonisville, Ky.—The plant of the Glasgow Electric Light & Power Company will be resold on the 19th of February, the former sale raving been set saide at the late term of the Barren Circuit Court because of the inadequacy of price it brought and inefficiency of advirtising.

Menominee, Mich—The electric light plant at the Ludington, Wells & Van Schaick Company's mill has been wrecked by the bursting of a fly wheel.

Merchantville, N. J.—There is a scheme on foot to consolidate all the gaslight and electric light companies in West Jersey. A large plant will probably be built in this place.

Muskegon, Mich.—The Shaw Electric Crane Company of this city will erect a new pattern shop and

storehouse adjoining their plant. The pattern shop will be built by the company

New Market, N. H.—The Newmarket Electric Light, Heat & Power Company has filed notice with the Sec-retary of State for an increase in its capital stock to \$10,000.

New York.-Plans have been filed with Building New York.—Plans have been filed with Building Commissioner Brady for the Edison Electric Illuminating Company's power-house, taking in the entire block between 38th and 39th streets, First avenue and the East River. It will be three stories, high, of steel skeleton construction, and cost \$809,000. The plant will include sixteen engines, which will operate at best economy when indicating 5,200 horse-power. Each engine will be capable of 8,000 horse-power, making the maximum capacity of the plant 128,000 horse-power.

Rockville, Ind.—The Rockville Electric Light & Power Company is now owned by Rockville capitalists.

Toledo, O.—The Toledo Traction Company has plans prepared for improvements to be made this year that will cost \$180,000. It is proposed to enlarge the power-creating facilities in the way of boilers, engines, etc.

#### MANUFACTURING, ETC.

Ft. Wayne, Ind.—The Fort Wayne Electric Company has the contract to put in a lighting plant at Morella, Mexico, and has already shipped a part of the machin-

Munising, Mich. -A new boiler and engine will be installed at the electric light power hous

Troy, N. Y.—The contract for installing an electric lighting plant in the works of the American Steel & Wire Company at Crown Point, N. Y., has been awarded to Philip S. Dorlon of this city.

Warren, O.—The New York & Ohio Electric Company of this city has been awarded the contract for furnishing the incandescent lights on the United States Government Building at the Paris Exposition.

#### POWER AND TRANSMISSION PLANTS,

Hoosick Falls, N. Y.—The Bennington & Hoosick Valley Railway Company is to have a power plant of its ewn. The company has bought a plot of ground and will erect a brick building 50 x 100 ft. Orders have been given for a cross compound condensing Corliss engine of 300 horse power, two Heine water tubes and a Westinghouse generator. The plant will be thoroughly equipped and will be in operation by May 15.

Niles, Mich — Representatives of the Michigan-Indiana Street Bailway Company have consummated a deal whereby the company agreed to pay \$10,000 for the privilege of constructing a dam at Berrien Springs across the St. Joe River at that place. The power to be derived from it is to be utilized for electric purposes. It is the intention of the company to build an electric street railway from South Bend through Niles and Berrien Springs to Benton Harbor.

Owatonna, Minn.—The city council has granted a franchise to the Owatonna Light, Heat & Power Company, permitting it to build a plant in this city.

Phoenix, Ariz.—Within six months Phoenix is to be supplied with electricity generated by water power 22 miles east of the city.

## MINES, ETC.

Twin Lakes, Col.—J. H. Brown, owner of the Gordon mine, is reported as saying that "there is an enormous mine, is reported as saying that "there is an enormous amount of power now going to waste in the Arkansas River and its tributaries that should be used in the generation of electricity for mining operations. There are several streams in this vicinity which could be harnessed to supply an immense amount of power, and I believe that it is one of the best fields for the investment of capital now open in Colorado."

Virginia City, Nev.—Leon M. Hall, who was re-cently appointed as consulting electrical engineer by cently appointed as consulting electrical engineer by the mining companies composing the Comstock Pump-ing Association, has been visiting this city and Gold Hill, for the purpose of inspecting the machinery of the various mines on the lode and will report on what can be adapted to electrical power and what will have to be discarded. His report will be an important one, and must be in the hands of the companies before they can begin preparations for the new order of things.

#### AUTOMOBILES.

Chicago, Ill.—This city is agitated over a resolution just introduced in its municipal parliament requiring fenders to be placed on automobiles used for rassenger or freignt purposes, and providing penalties ranging from \$25 to \$100 for violations of the ordinance.

New Haven, Conn.—The Kidder Auto Vehicle Company which has just been organized with a capital of \$500,000, has taken the first step toward locating in this city by leasing the larger part of the old New Haven Chair Company's plant on Audubon street. Work on orders received will commence immediately and it is expected that the first results in manufactured articles will be put on the market by the first of the spring. spring.

Washington, D. C.—It has been reported that the Washington Electric Vehicle Company, the local off-shoot of the New York Electric Vehicle Company and other concerns having the Columbian electric automotive reports in about to begin humans. bile patents, is about to begin business.

## THE TELEPHONE WORLD.

#### The Chicago Telephone Company.

Stockholders of the Chicago Telephone Company, over 41,500 shares out of a total of 50,000 being represented at the meeting, unanimously approved the proposition to increase the authorized capital stock from \$5,000,000 to \$15,000,000, the additional \$10,000,000 to be issued from time to time as may be needed for improving and extending the plant. Chauncey Keep was elected a director to succeed the late Norman Williams.

The financial statement showed an increase in gross earnings of \$360,705, or 15.6 per cent, as compared with 1898, against an increase of 11.3 per cent, last year, 5.94 per cent, in 1897, and 11.1 per cent, in 1896. The net earnings of \$676,559 were the largest in the history of the company, and notwithstanding the increase in the dividend requirement resulting from the issuance of \$663,500 new stock during the year, the surplus for the year increased \$3.427.

At the annual meeting of the Fairmont Telephone Company, of Fairmont, Minn., referred to in last week's issue of ELECTRICITY, a change was made in the articles of incorporation as follows: Capital stock raised from \$25,000 to \$100,000, and limit of indebtedness raised from \$3,000 to \$5,000. The company now has a line to Heron Lake, with stations at all intermediate points to Armstrong south via East Chain, Centre Chain and Wilbert, north to Truman, Lewisville and Madelia. The company owns a franchise at Madelia, and will put in an exchange at that place in the spring. They ontemplate extending a line direct to Blue Earth along the Northwestern road and also along the Burt-Sanborn line and the M. and St. L. from St. James to Estherville, and have direct connections with every town in the county. The line now connects with the Northwestern at Madelia and Heron Lake and with the Western Electric at Armstrong, giving good communication service all over the Northwest. The old board of directors were elected for another year as follows: W. W. Ward, P. R. Matson, Cecil Sharpe, Elmore Houghtaling and A. H. Smith. Immediately after adjournment the oard met and elected W. W. Ward president, P. R. Matson vice-president, and D. S. Wade secretary-treasurer for the ensuing year.

Mr. William L. Holmes, president of the People's Telephone Company of New Orleans, La., referring to the achievements of the company is reported as saying: October a year ago we began work here and in the fifteen months intervening we have established ourselves completely, put in underground conduits, put in an elaborate exchange and have now in operation about 3,000 telephones. There are still some districts of the city we have not yet reached and now have applications on file for over a thousand 'phones, which we expect to have in operation within a short time. It is my confident belief that by the end of the present year we will have 6,000 telephones in working order and within the next two or three years our list of subscribers will number 10,000. It is all a matter of educating the people up to the usefulness of the telephone. It will be remembered that only a few months ago the number of telephones in use here was comparatively very small. The people had never used the 'phone to any great extent, consequently did not feel the need of them. Now the city is fast being made a network of telephone wires, for the people have begun to realize fully what a great laborsaving device the telephone really is, and soon nearly all the better class of residences and all the business concerns will have telephone connections,"

A deal has been put through whereby the Detroit Telephone Company of Detroit, Mich... and the New State Telephone Company, known as the Independent Long Distance State I xchinge Company, become the property of the Erie Telephone Company. The terms on which the negotiations were closed, it is said, call for the purchase by the Erie syndicate of \$500,000 of the stock of the Detroit company at fifty cents on the dollar, and the entire issue of bonds at eighty-five cents on the dollar. The bonds aggregate \$600,000. The purchase of the Independent State line stock was at the rate of fifty cents on the dollar for \$600,000 of stock and eighty-five cents on \$100,000.

Montclair, N. J., is to have a new long distance telephone line. Negotiations which have been in progress for some time have at last been consummated by which the majority interests in the local independent telephone company have d sposed of their stock to the Telephone, Telegraph & Cable Company of America. Dr. Morgan Wilcox Ayres, who was interested in the Montclair Independent Company, is reported as saying: "We hope soon to have direct connection with New York over the independent system's trunk line, and other advantages will accrue that will be profitable to our citizens. So far as I know, there will be, for the present at least, no change in the personnel of the local company, except that one or two direct representatives of the larger company will be placed on the local board."

#### A Barbed Wire Telephone System.

The following account of a barbed wire telephone system appears in the Chicago "Record":

"A telephone system has been opened at Anderson, Ind., that is one of the most unique and interesting things of the kind in the country. It is a long-distance line, and the wire is the upper strand of barbed wire fences reaching from Anderson to Ingalls, a distance of twelve miles. It is the idea of an eccentric inventor of Pendleton, Cassius Alley, and he has already begun to reap his little harvest. There are two long-distance lines of the big companies between the two points, but Alley, with his barbed wire affair, has entered the list and proposes to get business by giving cheaper rates.

"The Big Four has a barbed wire fence most of the distance along its right of way from here to Ingalls. Alley has taken the upper strand of wire for his unique telephone. Three miles from Anderson the line leaves the railway lines and cuts along farm fences. Where a road is crossed an overhead or underground wire is strung. Crossing streams there are overhead connections. The boxes are such as are used by the big telephone companies.

"There are two charter subscribers. A firm has an office here and a factory at Ingalls, and has them connected. The line works splendidly. Alley gets \$50 a year from each firm. Other places will be connected, and in a short time all six wires on the fences will be in service. It is then the intention to connect a line from Pendleton to Greensfield, and if Alley can do it he will soon have in service every wire fence in the country. He looks forward to a big business in the way of rural telephone service.

"When the line strikes cities or towns the fence wire gives way to ordinary wire that is strung along trolley line poles. Over roads and streams connections were made overhead or by underground conduits. The expense has been but a tritle.

"In some places the barbed wire has been insulated with a coating of rubber paint. Most places, however, small boys will have to keep off or get a shock every time the bell rings. Hunters, too, will have to look out. The service is practical and first class in every respect."

The multi-diaphone, which is one of the features of the telephone improvements that will be placed on the market by the American Telephone Repeater & Quad Company, is an ingenious appliance that is thought to be destined to revolutionize telephone communication, if successful, says the "Republican" of Springfield, Mass. It has been given careful tests by its inventor, Lewis Walkins, of Springfield, and the local members of the new company are quite enthusiastic over the matter. The invention is intended to follow the arrangement of the interior of a human ear, and by installing it on the line a message may be repeated on long-distance service. The inventions controlled by the new company will also, it is claimed, make it possible for any number of persons to use the same wire without interruption and a return circuit is not needed. By this improvement a common wire may be used for the telephone service and any of the telegraph wires through the country may be utilized at great economy in equipment. It is stated that Mr. Walkins has already received handsome offers for his patent.

The Citizens' Telephone Company of Houston, Texas, held the first annual meeting of its stockholders recently, electing the following directors: C. C. Greenleaf, H.Brashear, W. H. Eager, E. A. Glass and F. C. Bogart. These directors met subsequently and elected the following officers: President, C. C. Greenleaf; vice-president and treasurer, F. C. Bogart; secretary, E. A. Glass. The company expects to have its system in operation within the next three weeks. They have already about 1,200 subscribers and are putting in a new switchboard of 1,800 capacity. They now carry on their pay rolls about seventy men engaged in the work of construction.

At the annual meeting of the Diamond State Telephone Company held recently at Dover, Del., Harry A. Richardson, Richard R. Kenney, Dr. E. S. Anderson, Daniel J. Fooks, Stephen Slaughter, George W. Emroy and H. L. Evans were elected directors. The directors chose Harry A. Richardson, president; Dr. Anderson, vice-president, and du Pont Walker, secretary and treasurer. The company now has poles and equipments delivered as far as Newark, Del.

The New England Telephone & Telegraph Company is increasing its toll lines out of Springfield, Mass., about 20 per cent. This is to provide for the increase in business which is expected from the recent change in toll rates by the company. The business has not yet increased, but it almost always decreases at this time of the year, and it is expected that the spring will see a considerable increase. The company claims that the new toll schedule will be of great benefit to the average user of the telephone, who has held the instrument three minutes or less. This man has had in the past to pay

proportionately more than the user for a longer period, and so in a sense has paid for the service of the latter. With the new arrangement, the company says, every one will be paying for just what he receives.

Immediately after the arrival of Mr. Burton R. Dodge of Post Mills, Vermont, in Toronto, Ont., the preliminaries, in connection with the organization of the Dodge Telephone Company, which, during some months past, have been under way, were definitely completed; and steps will be at once taken to get down to active business. The prospects of the company are said to be of the most flattering character. Its operations it is thought will revolutionize the business of telephoning in Toronto, and eventually throughout Canada.

The Knickerbocker Telephone & Telegraph Company of 100 Broadway, New York, have some sixty canvassers at work obtaining contracts for the service of that company in this city. The contracts read that unlimited service in the bor oughs of Manhattan and the Bronx shall be furnished for \$60 a year, and unlimited service for the five boroughs for \$120. The contracts do not become operative until 5,000 subscribers have been connected with the exchange. It is understood a large number of business houses have signified their intention of becoming subscribers.

The annual meeting of the Northeastern Telephone Company was held in Rush City, Minn., recently, when the following officers were elected; A. J. Stowe, president, Rush City; P. M. Peterson, vice-president, Stanchfield; S. A. Nebel, a cretary, Danewood; J. C. Carlson, Rush City. The board of directors is composed of all the officers excepting treasurer, and including C. F. Jackson, Rush City. The compuny intends extending its lines to adjoining towns early in the spring and will make other improvements.

An accident recently occurred to the plant of the C tizens' Telephone Company in St. Joseph, Mo.. An electric light wire became crossed with a telephone wire and sent a current into the terminal board. Every fuse in that part of the terminal board was burned out and the telephone exchange was dumb all day. The current played havoc with the delicate and costly mechanism.

The United States Telephone Company, Columbus, O., has given a blanket mortgage to the Cleveland Trust Company in the sum of \$100,000. The mortgage is for twenty years, and expires in 1919. It bears 5 per cent. interest, and is payable in gold. The mortgage covers the property of the company in fifty counties.

A dispatch from New Kensington, Pa., states that after holding over the ordinance for almost two months the borough council has granted a right of way to the Federal Telephone Company. The company is also applying for similar privileges in Arnold and Parnassus, Pa.

At Antelope, Ore., the stockholders of the Wasco Southern Telephone Company have elected directors, of whom J. N. Burgess is president and F. N. Wallace secretary. The work of setting poles and stretching wires will commence about April 1.

The Westmoreland Telephone Company of Greensburg, Pa., is said to have sold its franchise to the Telephone, Telegraph & Cable Company of America, the consideration being \$25,000.

The South Carolina Telephone Company is said to be rushing the construction of its plant in Columbia, S. C. The system it is thought will shortly be in working order.

It is likely the private telephone line among the farmers in the vicinity of Moville, Ia., may be extended as a number have indicated a desire to enjoy its advantages.

The Bell Telephone Company proposes to make a number of important changes in its plant at Nebraska City, Neb.

#### TELEPHONE INCORPORATIONS.

The Manning Telephone Company, Manning, S. C. Capital stock, \$2,000. Incorporators: F. C. Thomas, D. M. Bradham, W. E. Jenkinson and R. L. Felder.

The Southwestern Telephone Company, Sante Fe, N. M.—
to build and operate a long-distance system from Santa Fe to
Lis Vegas and other points. Capital stock, \$25,000. Incorporators: A. A. Newberry, Oliver B. Steen and W. N. Townsend.

The Quannah Telephone Company of Quannah, Texas.—to construct, maintain and operate a telephone system. Capital stock, \$4,000. Incorporators: John Ledbetter, J. G. Witherspoon, A. J. Fires and M. M. Hawkins.

## NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 153@16c.; Lake, 16@16½c.; casting, 15½@15‡c.

The United Traction Company, of Albany, N. Y., has authorized the issue of \$1,000,000 new stock to pay for re equipping the Troy division.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 15(220; New York Electric Vehicle Transportation, 94(494; New England Transportation, 64(474).

The Bell Telephone Company of Philadelphia, Pa., has declared a dividend of 2 per cent., payable January 27. The stockholders of this company will meet March 20 and vote on the proposition to increase the capital from \$4,000,000 to \$6,000,000.

The stockholders of the Nassau Electric Railroad, of Brooklyn will hold a special meeting February 13, to approve a lease for 999 years to the Brooklyn Heights Railroad, of all property, rights, privileges and franchises except its franchise and the right to be a corporation.

It is understood that Vermilye & Company have purchased the entire amount \$440,000, of Worcester Consolidated Street Railway Company 20-year 4½ per cent. bonds, issued to refund all the present outstanding bonds. The new issue has been approved by the Massachusetts Railroad Commissioners.

The real estate and plant, wires, poles and lights of the Charlestown Electric Light & Power Company, a corporation of Charlestown, W. Va., were sold at public sale by B. D. Gibson, trustee, to C. E. Ehrehart, of Hanover, Pa., for \$10,150. The sale was made to pay mortgages and to settle the estate of H. S. Rieley, deceased, of Hanover, who was a stockholder in the company.

The Council of the city of Washington, Ind., has purchased the local electric light plant, paying for the machinery and buildings \$67,000; for a three year's franchise, \$10,000; for interest and cost of incorporation into a company, \$32,050, making the total cost of the plant \$109,050. It will be owned and conducted by the city under the name of the Washington Light & Water Company.

The Capital Traction Company of Washington, D. C., has decided to issue bonds to the amount of \$1,500,000. This sum goes to replace the expenditure of the company made necessary by the installation of the underground system and the purchase of new cars. The stockholders will be offered \$1,080,000 of the issue at par, while the remaining \$423,000 will be set aside as treasury stock.

Jodge Gray, in the United States Circuit Court, has refused to grant a preliminary injunction to have set aside the lesse of the Consolidated Traction Company's lines in E-sex and Hudson counties, N. J., to the North Jersey Street Railway Company. The injunction was desired to restrain the payments of rentals under the lesse in the snape of dividends to the stockholders of the Consolidated Company.

At a recent conference with officials of the Manhattan Elevated Railroad Company of New York the Park Board decided to give the company time to file new plaus before taking decisive action against the further use of Bittery Park for the "L" loop. It is further asserted that officials of this company have infermed the State Railroad Commissioners that the road will comply with the recommendations of the board and extend its east side line from 177th street to the Bronx Park at Bedford Station.

The stockholders of the Birmingham Railway and Electric Company of Birmingham, Ala., will hold a meeting on February 14 for the purpose of considering the question of increasing the bonded indebtedness of the company by borrowing a sum of money not exceeding \$3,000,000 such indebtedness to be secured by a mortague or deed of trust upon the railroads, franchises, rights, privileges, property and assets of said company and to be evidenced by bonds to bear not exceeding 6 per cent, interest per annum.

At the annual meeting of the Kings County Electric Light and Power Company stockholders the following directors were elected: Felix Campbell, Hugh J. Grant, T. S. Williams, William Berri, Seth L. Keeny, Charles Cooper, A. M. Young, Walton Ferguson, Sr., B. Gallagher, A. N. Brady, H. C. Duval, Thomas E. Murray and William Speehan. After the directors were elected they met and organized with Anthony N. Brady, president; A. M. Young, vice-president; W. W. Freenan, secretary; A. W. Dater, treasurer, and A. N. Neilson, assistant treasurer.

secretary; A. W. Dater, treasurer, and A. N. Nellson, assistant treasurer.

A Hartford paper states that on recommendation of the directors of the Hartford Electric Light Company, the capital stock will be increased from \$700,000 to \$1,000,000. The new stock will be allotted at par to old stockholders and will be used to pay for the new power developed at the Farmington river, and a new storage battery at the Pearistreet plant which will be used for other purposes. There are \$150,000 of 6 per cent. first mortgage bonds of the Hartford Light & Power Company, which it has guaranteed, that are subject to call at any time and which may be retired.

The Hudson River Water Power Company, recently organized, in addition to securing four and one-half miles of land on both sides of the Hudson River, some five miles below Glen Falls, has secured an option on the plant of the Saratoga Gas, Electric Light & Power Company, a concern with present net earnings of \$49,000 a year. It is proposed to issue \$750,000 5 per cent. 3) year gold bonds to pay for the two properties and to provide for the construction of a 72-foot dam and power and transmission plant. These bonds will be offered at 101 and interest. The total issue is limited to \$1,500,000.

It is understood that the rapid transit tunnel commission and Comptroller Coler will ask the New York Legislature to amend the charter of Greater New York so as to recognize explicitly the rapid transit commission and to authorize the comptroller to is ue bends as work on tunnel progresses without consulting the municipal assembly. It is estimated that the tunnel will add \$600,000 to realty values along its line by the time express trains are run "to Harlem in 15 minutes." Much of this gain has already been discounted in the Upper Broadway. Harlem and Bronx districts, where values have already risen 40 per cent. to 200 per cent.

For the development of the lines now under its control and for its future growth, a mortgage for \$5,000,000, made by the Rhode Island Suburban E ectric Railway Company in favor of the Union Trust Company of Providence. R. I, has been recorded. The mortgage is made to secure the issue of \$5,000,000 of bonds. The property covered by the mortgage includes the Warwick and Oakland Beach road, now operated as a branch of the Stonington division of the New York, New Haven & Hartford Railroad, and to be opened as an electric road by the Suburban Company. The Rhode Island Suburban Railway Company is capitalized for \$5,000,000, with authority to issue \$5,000,000 in bonds in addition to that amcunt in stock.

000, with authority to issue \$5,000,000 in bonds in addition to that amount in stock. The present capital stock of the Third Avenue Railroad Company amounts to \$40,000,000 authorized and \$16,000,000 paid in. An increase from \$12,000,000 was voted by the stockholders last July. The bonded debt is \$5,000,000. The increase in capitalization was to provide for improvements, change in motive power and payment of floating debt. The floating debt to be retired amounted on June 31, 1899, to \$13,385,123. The underwriting of the floating debt will be undertaken by a syndicate headed by both Kuhn, Leeb & Company and J. P. Morgan & Company. In 1896-97 dividends of 82 per cent. were paid. in 1897-98, 8 per cent., in 1898-99, 72 per cent. In November last the quarterly dividend was reduced from 12 per cent. to 14 per cent., placing the stock on a 5 per cent. basis.

#### EDITORIAL NOTES.

Facts About the Independent Telephone Situation in Michigan.

About two weeks ago the Erie Telephone Company obtained control of the Detroit Telephone Company of Detroit, Mich., and of the New State Telephone Com-

pany, known as the Independent Long Distance State Exchange Company. These two companies operate about 6,000 miles of long distance lines and have about 10,000 subscribers in Detroit and other Michigan cities and towns. This move on the part of the Erie Telephone Company was hailed with delight by the anti-independents, and it was given out that as these two companies controlled some 70 per cent. of the independent exchange business in Michigan the deal was a heavy blow to the independent telephone movement not only in the West but throughout the whole country. Referring to this subject Charles J. Glidden, president of the Erie Telephone Company, is reported as saying:

"The independent telephone promoters of the country have acknowledged these two companies as the foundation of the independent telephone movement in the United States. The close of these negotiations we believe to be the beginning of the end of the independent telephone movement. There may be further consolidations,"

Now as a matter of fact the two companies taken over by the Erie Telephone Company by no means represented 70 per cent. of the independent business in Michigan. as will be seen by the following communication from Mr. J. B. Ware, secretary of the Citizens' Telephone Company of Grand Rapids, Mich.;

GRAND RAPIDS, Mich., Jan. 22, 1900. Editor Electricity,

Sir: We thank you for the clippings sent us. The writer has been too busy the last few days to give any details of the situation. Briefly, however, can say the Eric Company has secured a majority of the stock in the Detroit Telephone Company and the New State Telephone Company; said companies each have the same board of directors and were organized by the same men.

The former company was built upon the proceeds of bond sales of \$600,000, the stock being given away, either with the bonds or issued by the directors, so that for the sale of the stock

to the Erie Company a good profit was realized by the holders of said stock.

The New State Company had no bonds, but a very large quantity of stock had been issued and all the exchanges and toll lines of said company had been built under contracts with the Construction Company, which was owned by the same board of directors above mentioned, so that there is no charge that any loss has ever accrued directly or indirectly to said directors.

The property owned by said companies approximates nearly thirty per cent. of the independent telephone property in Michigan.

Mr. Flowers, the president of the New Company, announces officially that the companies will be continued as independent and thus far there is no change in their relation to the other companies of the State, as business is being received from the independent toll lines connecting with said companies the same as heretofore.

Our company naturally covers the territory which is tributary to Grand Rapids, and less than 5 per cent, of our business passes to points on the New State Company's lines and less than 2 per cent. goes to Detroit, so that while the defection of the Detroit Company is unfortunate, it is not a surprise nor is it a calamity.

The enclosed clipping shows the attitude of the Erie Company toward the West Michigan Companies, but owing to the fact that President Glidden announces that the rates for business telephones will be \$48, while we charge but \$30 for the same service (being metallic circuit with long distance transmitter 'phones), it is readily seen why our company and especially our community cannot sell its interest to the Erie Company.

There is no disposition on the part of any element and much less the companies in Western Michigan to turn over to the Erie Company any more of the independent property of the State. Yours truly.

CITIZENS' TELEPHONE Co.,

Per J. B. WARE Secretary.

The clipping referred to in Mr. Ware's communication is taken from a Grand Rapids paper and quotes President Glidden as follows:

"I am not here to negotiate with the Citizens' Telephone officials and have made them no offer whatever. Neither have they approached me. I would willingly enter into negotiations with them, however, for I think the amalgamation of the two companies is sure to come about

sooner or later; that the telephone business is naturally a monopoly.

"We do not intend to freeze out any stockholders. All will be protected if the consolidation is effected. Our rates would not be raised from the present figures and we would be willing to make twenty-five-year contracts, give subscribers the privilege of changing from one rate to another, or of canceling their contracts at pleasure.

"A sliding scale of rates would be put into effect under the consolidation, if it should be made. Contracts would be made at the present prices. The best long-distance, metallic-circuit 'phones for business places cost \$48 a year and the lowest business place rate is \$18 a year. For residences the rates vary between \$36 and \$12 a year."

From what appears above it may readily be inferred that the defection of the two independent companies in question is not such a great victory for the Bell monopoly as the daily papers and officials of the Erie Telephone Company would lead one to suppose, and as for its being the beginning of the end of the independent movement in the United States it can safely be asserted that it does not even sound the death knell of the independent movement in Michigan alone regardless of the rest of the country.

\* \* \*

Projectiles to be Fired by Electricity. In the issue of ELECTRIC-ITY of April 20, 1898, there appeared a short article descriptive of an electrical dynamite gun, invented by

a resident of Washington, D. C. By means of this weapon shells containing high explosives could, it was thought, be thrown a distance of five or six miles by making use of a solenoid as the projecting power. Whether this type of gun was given a trial and proved a failure or whether the invention was allowed to sink into oblivion, like so many other devices for which patents are obtained, we are unable to say, but one thing is certain, and that is that nothing more was heard of the so-called electric gun until recently when a New Orleans, La., paper appeared with the statement that a resident of that city had brought out an electric gun operated on practically the same principle as the gun described by us some two years ago. According to the paper already referred to the cannon never gets hot, and can be fired as fast as it can be fed, indeed two or three shots can be going through it at the same time. The modus operandi is described as follows:

"If a tube is wound with insulated wire and an electric current is sent through the wire, magnetic attraction is set up inside the tube, and small pieces of firon or steel may be drawn toward the center. This is a familiar experiment in physics. If an iron rod fitting the tube is placed near it it will be drawn into the tube by the force of the magnetism. The current is cut off the instant the iron rod or projectile reaches the center of the tube. Then it meets with no resistance beyond the center, but darts on through the tube. If after passing through one tube it enters a second tube in which the same process is repeated, it gains additional momentum, and if it passes through still another tube, all in a straight line, its momentum can be increased until it acquires enormous speed."

The great trouble with a gun built on this principle would seem to lie in the fact that in order to obtain a high muzzle velocity an exceedingly long tube would be required which

must be kept in perfect alignment, which requirements would necessarily limit the field of usefulness of the weapon.

Theoretically such a gun should accomplish what is expected of it, but unfortunately unforseen difficulties have a habit of cropping up when inventions are tried on a practical scale, and the electric gun would probably be no exexception to the rule, for as nearly as can be ascertained no model larger around than an ordinary lead pencil has as yet been constructed by the New Orleans inventor.

The merits claimed for such a gun are its freedom from smoke and noise, its lightness, its cheapness, the fact that the barrel does not become heated, and that it is possible to fire the weapon as fast as it can be loaded. On the other hand, the inventor is said to frankly admit that his cannon will scarcely do for field service, as it would be necessary for the artillery to carry along powerful electric batteries, but that it is just the thing for fortifications where connections can be made with dynamos. He is also of the opinion that, it would be well adapted to the discharging of dynamite and gun cotton. In fact owing to the absence of rifling this would seem about the only use to which such a gun could be put, providing of course the principle was found to work all right on a large scale. As the New Orleans inventor proposes to construct at once a large service model with a view to testing the practicability of his ideas, an opportunity will be afforded the public of ascertaining whether electricity can be successfully applied to the throwing of heavy projectiles or not.

## UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

It is announced in Washington that exhaustive investigations will soon be conducted by the Weather Bureau with the Fessenden system of wireless telegraphy.

THE Niagara Falls Power Company has passed a resolution stating "that the company is opposed to a duty upon electricity generated in Canada and transmitted to the United States: that the imposition of such a duty is not required for the protection of any American industry, and that it might invite retaliatory legislation by the Canadian Government."

WE are informed by Secretary George F. Porter that the dates decided upon for the twenty-third Convention of the National Electric Light Association are May 22, 23 and 24, 1900. The meeting will be held in Chicago.

THE "Industrial Exchange" of New York has gone out of business, the sheriff having taken possession of the effects to satisfy a judgment of \$14 in favor of the General Electric Company.

A dispatch from Berlin, Germany, says that the Berlin Elevated Railroad Company intends to introduce electric motive power, at a cost of \$10,750,000. The projected system will be modeled after the Chicago South Side Railroad, the present steam system having proved inadequate.

EXPORTERS will be interested in an opinion just rendered by Attorney General Griggs to the effect that upon bills of lading, receipts, manifests, and other similar documents issued

by railroad companies for the receipt of goods to be transported by rail from any place in the United States to Canada or Mexico, a stamp tax of 1 cent is payable under Schedule A, of the war revenue act of June 13, 1898, and that no tax is payable thereon under the clause relating to goods exported from a port or place in the United States to any foreign port or place. In other words, export bills of lading issued for goods shipped by rail outside of this country require a 1-cent stamp and not a locent strup, as heretofore required by the Internal Revenue Bureau.

Signor Guarini of Brussels has patented an apparatus which is said to be an improvement upon. Signor Marconi's method of wireless telegraphy. It will be tested between Brussels and London. He talks of wireless communication between London and New York as "well within the range of probability."

A new and attractive feature has been added to the many attractions at St. Augustine, Fla., for the amusement and entertainment of the visitors, in the way of electric launches for pleasure-seekers. Four new electric launches were recently sent there from New York and are now ready for the season's service.

UNITED STATES CONSUL NELSON at Bergen, Norway, says that the projected telegraphic communication with Iceland is interesting all of Northern Europe. The main question of issue is in laying the cable, which will be 403.89 miles long, extending between Iceland and the Shetland Islands. The Northern Telegraph Company of Copenhagen, Denmark, has offered to lay the cable under a peculiar contract, which calls upon Iceland to pay a yearly subsidy of \$9,380 for twenty years; Denmark, a yearly subsidy of \$13,400, and the neighboring countries an aggregate sum of \$91,450. This, with the interest, would give the company \$1,407,000—a good profit, considering that the cost of laying the proposed line would not be over \$850,000.

Representatives of the Model Marine Motor Company announce that they will be in New Haven. Conn., in the course of a few days "to demonstrate the value of the model marine motor to all those who use electric light, heat and power, and the company believes that its efforts to present a plan whereby New Haven can secure cheaper light, heat and power, nevertheless at a profit to itself, will not have been in vain. New Haven has been selected as the basis of operation by the company because it is contiguous to to the wave motion of Long Island Sound, which is necessary to the successful application of the principles on which this new apparatus is devised, and is peculiarly adapted to the successful operation of a large storage battery. It is also the seat of a large population and many industries, which are large consumers of light, heat and power.'

A Mysterious illuminated sentence-writing stylus for use as an advertising novelty, employing electric flashes to heighten its effect, has been ingeniously worked out by a resident of Toledo, O. As a matter of fact electricity has nothing whatever to do with the production of the writing, this being produced by covering a glass writing surface with an opaque paint and removing this paint with a leather stylus, thus permitting the light from some source, such as an incandescent lamp, to show through, forming illumined letters. It is the mysterious

the appearance of each letter that, attracts attention and gives novelty to the scheme. This flashing effect is produced by the stylus, which is designed to be held in the hand in the usual manner for writing. The spring carries at its end a carbon point, and opposite to it on the body of the holder is another carbon point, each of which is connected to one side of an electrical circuit. When this circuit is made and broken between the carbon contacts by depressing and releasing the spring, an arc is formed between them, and as this arcing is continued during the writing and appears just above the last part of the letter formed it gives a weird, startling effect. Provision is made in the stylus to embody in it aspestos to protect the fingers from being burned by the heat generated by the continuous arcing.

CHARLES JARROTT, the amateur motor-cycle champion of Europe, who arrived in New York last week from England, is anxious to race in this country for \$5,000 a side, the money to buy a trophy, for Mr. Jarrott does not ride for cash. He said that he was willing to ride any distance on road or track. Henri Fournier, the noted French automobilist, now in this country, promptly announced his intention of accepting Jarrott's challenge. Fournier's employers will back him. If the match be arranged, and it probably will be, the Frenchman will ride an American cycle driven by an American motor. Both men are to ride in the next Paris-Bordeaux race.

An electric balloon for night signaling is among the latest ideas, especially for use in the Boer war. According to the plan, the balloon, made of gold-beaters' skins, carries a number of electric lamps, which are connected by wir with an apparatus below. These lamps are flashed at intervals corresponding to the dots and dashes of the Morse code, and on a clear night can be seen 100 miles away. The balloon may be sent up some distance from an army, connection with the ground apparatus being made by wire. The chance of the balloon being hit by sharpshooters is small, as it is sent up at night, and unlighted, so that when the signals are begun it is out of range. A number have been sent out to South Africa to be tested.

THE story of Thos. A. Edison's constant smoking while at work in his laboratory seems to be only partially true. He puts a cigar in his mouth when he begins work, but at once becomes so absorbed in his work that he often forgets to light it, though he keeps "drawing on .t " vigorously all the time,

THE General Electric Company reports that it has received a contract from the Sao Paulo, Tramway, Light & Power Company of Sao Paulo, Brazil, for one of the largest and highest tension power transmission plants ever exported. The value of the equipment is said to be \$200,000,

In a recent issue there appeared a short item referring to the influence of Roentgen rays on selenium, as determined by M. Perreau, a French scientist, and for which we were indebted to the "Electrical Engineer," London. The same contemporary now gives further details. M. Perreau experimented with a thin strip of selenium which had under normal conditions a resistance of 40,000 ohms. It was contained in a via: box which could be closed by an aluminum lid. The resistance of the strip when exposed to the diffused light from a gas-burner placed

and magical effect, however, that accompanies about 5 ft. away rapidly fell to 33,000 ohms. When the light was withdrawn, the resistance returned to its original value very quickly. The strip was then exposed to the rays coming from a Crookes tube placed at a distance of about 2 in, from it. The resistance rapidly diminished till it reached 34,000 ohms, small variations of the same taking place, which the author attributes to the variation of the intensity of the rays given off by the tube. When the tube was shut off the resistance of the strip gradually returned to the first value, it being remarked that this return was much slower than after the exposure to gaslight. The reduction of the resistance, of course, diminished as the Crookes tube was removed further away from the strip, but it was still appreciable when the tube was some 7 in. away from the strip. The interposition of substances more or less transparent to the cathode rays sensibly affected the reduction in resistance. The experiments were made in the physical laboratory of the university at Nancy.

> An interesting hydraulic plant has just been completed at Laxey, on the Isle of Man for working the electric railway between Douglas and Ramsey during the winter months. The plant has been in operation for about a fortnight, and thus far has given very satisfactory results. The principal advantage in the use of hydraulic power at Laxey, according to the London "Electrician," is that it enables the entire steam plant to be shut down for about seven months in the year, during which time the pressure of traffic is at a minimum.

> Two talking machines occupied the pulpit at Zion Tabernacle last Sunday afternoon at Chicago, and through them "Dr." J. Alexander Dowie, while resting quietly at White Lake, Mich., conducted service in Chicago. "Dr." Dowie's voice could be heard all over the auditorium. He not only preached to the congregation but announced hymns, made a prayer and gave out the regular notices.

> THE New York Fire Department is about to introduce an innovation in the way of a pocket telephone. The device is expected to facilitate and expedite the work at fires by placing the battalion chiefs in direct communication with headquarters, so that the size, extent and progress of fires can be reported without delay. The telephone is enclosed in a compact case of hardoak, covered with leather, and measures only eight inches in length, three in breadth and two and a quarter inches in depth. It is complete to the minutest detail. To get into direct communication with headquarters all that is necessary is to hang the telephone over the door of a fire box and insert a plug into a tapering hole in a block of brass within the box, thus completing the circuit.

"When I was in Chicago for a few weeks last summer," said a well-known electrical engineer recently, "the office building I was in was infested with rats. At my suggestion the owner of the premises placed two electric wires of opposite polarity across the rat holes in the basement in such a position that a rat must touch both in coming out. Some were shocked, but most of them were killed and the place was soon entirely freed from the pests. As you know, rats are sagacious and have a method of communicating between themselves and it is only necessary to give a few of them warning of impending danger to drive away the entire brood."

A Washington dispatch states that the House Committee on Claims has favorably reported the bill reimbursing the English Cable Company for the cutting of two cables by Admiral Dewey during the war with Spain, amounting to \$4,500.

THE British Admiralty, according to an exchange, has determined to fit several vessels of the Channel Squadron, viz., the Majestic, Magnificent, Hannibal and Jupiter, with wireless telegraphic apparatus on the Marconi system; and the signal boatswains of the two flagships and two petty signal officers on each of the ships in question are being instructed in wireless telegraphy on board the Hector at Portsmouth. It may be regarded as extremely probable that all the vessels of the British navy will eventually be equipped with wireless telegraphic apparatus.

THE electric railway between Burgdorf and Thun in Switzerland, mention of which has already been made in these columns, is nearly twenty-five miles in length, and the power station at Spies has four groups of turbine generators. The turbines operate under a head of 200 ft., and the maximum hp. obtainable is 6,300. Alternating current is generated at 4,000 volts and is raised to the transmission voltage of 16,000 volts by static transformers. The current is carried to 14 transformer stations by means of three copper wires of 0.2 in. diameter, carried on porcelain double-petticoated insulators, mounted on wooden poles. The transformers, which are oil-insulated, and have a capacity of 450 kilowatts each, are placed at the side of the track and are enclosed in metal housings with wooden shutters supported on concrete bases. On account of the use of the three-phase system two trolley wires are used, the rails, which are bonded, acting as the third conductor. The voltage of the current, as received from the transformers, is 750 volts.

An immense experiment is about to be undertaken at Wrightsville, Pa. To utilize the water power of the Susquehanna River, \$5,000,-000 is to be expended on a dam and dynamo outfit. York Haven is to be provided with a plant at almost equal cost and the two establishments are to supply power to trolley roads for the neighboring territory. Electric lighting and the furnishing of power to manufactories will also be a feature of the new business. The experiment ought to succeed; the success of the great Niagara Falls power plant is a strong augury that it will.

HAMILTON KING, Consul General for the United States in Siam, has sent the following report to the State Department from Bangkok: "There is an 8,000-light (incandescent) central station in Bangkok which was purchased in 1890 from an English company by a Siamese company, for the purpose of lighting the King's palace and for the use of the public. The plant was not operated until 1894, as the company met with financial difficulties, and finally it was turned over to Mr. L. E. Bennett, an American engineer, under a 20-year exclusive franchise to furnish light for the Government and the public. Since that time it has been operated fairly well by an American syndicate. This plant, which is at present valued at \$200.-000 in United States currency, has recently been sold to a Danish company, and will be extended and improved. Most of the supplies for these works have been puchased in Europe, but very recently several orders have been placed in America."

### THE FUTURE OF ELECTRIC ILLU-MINATION.

BY JEAN WETMORE.

#### PART V.

We have not been awake to the inefficiency of our high amperage lighting systems; we do not realize that less than one per cent, of the energy from a given source is actually utilized in an incandescent lamp in producing light, and this fundamental fact is ordinarily lost sight of by inventors and investors. There is a loss in the turbine water-wheel as well as by incomplete combustion in the boiler-furnace, a loss of energy by friction in shafting, heat radiation from boilers, pipes and the engine itself, and an immense amount of heat and unconsumed carbon goes up the smoke stack. There is back pressure in the exhaust of engines, there is a great loss in the conversion of mechanical into electrical energy, there is resistance in electric conductors, and there is an enormously greater loss of energy in producing heat in the incandescent lamp than is used in producing light; and then again there is a large apparent effective loss of light in the present method of suspending the lamps downward towards the center of the room.

The whole lighting system is full of holes through which leaks, at a conservative estimate, over 99 per cent. of our primary energy. Our systems of conversion are extravagantly wasteful.

It is said that our Western abattoirs utilize every portion of a hog, from its eye teeth through to its tail, except its squeal, and now it is proposed to make use of the squeal by a phonographic reproduction in childrens' toys. These economies should be an object lesson to electrical engineers.

The inventor who produces a two-candle-power light where there was but one before, will be a public benefactor, provided some one hundred million dollar electric trust does not pigenhole the patent to save replacing its present investments, or utilize the saving to pay dividends on highly watered stock.

As the primary object of this series of articles was to point out the defects of our present system of lighting, with special reference to lamps, wiring and the paraphernalia closely connected therewith, and their bearing on the electric illumination of the future, we will now, as a Frenchman would say, "return to our muttons."

The main object of living is happiness, and to produce discontent and dissatisfaction without trying to indicate the remedy would produce a bad impression. We well remember during our school days that one of the so-called evidences of a future life was the universal desire of the human race in that direction; for the last ten years our original electricians have been resting on their well earned laurels or have turned their efforts in other directions; radical improvements are not in order and we do not hear so much, nowadays, about electricity being in its infancy. Discontent is the forerunner of improvement, and we all know that necessity is the mother of invention. A carping spirit is not the incentive of the writer, but rather to emphasize deficiencies that improvements may be made. We must often tear down before we can build.

Inventors have struck a snag, as they are now often expected to deed over 97½ per cent. of their invention and all the improvements

they have not made, and do not own, to a promoter who has no money; in consideration of his promises to do something with an imaginary mysterious individual who has money; and though that imaginary being materializes, the harder the inventor works and the longer he wrestles with the money-power the less he receives, and finally another laurel wreath of bronze is seen in Greenwood cemetery and another batch of scientific dissertations are printed to be seldom read.

The electrical illumination of the future will probably produce a few more of these benefactors of the human race, these ill-starred "cranks" that turn the wheels of progress,

Our future improvements must fundamentally recognize vibrations as a basic starting point. Every particle of the universe is in a constant state of motion. One single particle in an absolute inert state would mean a universal smash up. Our senses recognize vibrations only; a certain number per second and we feel cold, a certain increase we feel heat, a larger number per second light, a still greater increase and all physiological sensations cease. Where there are a mixed number of vibrations of a certain number each per second, we perceive both heat and light at the same time.

When a piece of iron is placed in the forge it becomes hot; as the particles commence to vibrate faster, a dim glow appears; a further progressive increase in heat, the iron shows colors succeeding each other in a definite succession. The blacksmith takes advantage of this phenomenon to commence forging when the critical color is reached; if the iron is heated still hotter, it becomes incandescent and gives off a white light, thus color is also dependent on a difference of molecular vibration.

If colors depend on varying rates of vibration, and heat vibrations are slower than light vibrations and the iron could be prevented from disintegrating, could not the molecular vibrations be so increased as to be all of them beyond the heat vibrations, leaving nothing but a white light without heat?

This thought is pregnant with possibilities, but there are no practical possibilities in this direction with iron, granting the hypothetical question. The iron molecules are so closely matted together that they interfere with each other. They cannot be made for this reason to vibrate in unison, for some of the vibrations are slowed down and will produce heat, and they cannot from the nature of the substance be all whipped up to the point of unison and maintained at the concert pitch of white light. And so with most all material substances with which we are acquainted, and to such a general extent that we have not learned in common life to disassociate light from heat.

Light without heat is a consummation devoutly to be wished, for if we could electrically convert all the heat vibrations into light vibrations, a wonderful economy in light production would follow, being careful, of course, of not going too far and by so doing defeat our purpose. In this latter case light would vanish, and radiant energy of a different nature would appear—no, not appear, for it would be of itself alone beyond the reach of our senses. Our clay-fettered souls must wait until in that undiscovered realm from which no traveler returns new and higher perceptions are given us.

Astronomers tell us that interstellar space, blacker than Egyptian darkness, long fabled as the blackest of the black, is so because there is nothing in this space to give light vibrations, but nevertheless there are vibrations of some

kind that are supposed to reach us from the sun through this interstellar vacuum, and when these vibrations reach the outer confines of our attenuated atmosphere they are slowed down, and this retardation produces light, and finally as they come nearer the heavier atmosphere, and still nearer, among the atmospheric moisture and dust particles, some of these vibrations are so much retarded as to produce heat, and when they strike the dark earth they are converted in a large part into heat vibrations.

If we could go high enough we would perceive a cold light, a light at a temperature of about absolute zero, in fact plenty of light at a temperature far below anything that Tripler has produced by means of liquefied air. Nature has thus, at least, given us an analogy of light production without heat and furnished the raw material in most layish abundance.

All human achievements are but a manipulation of nature's forces; human as we are, is it not as much in the line of reason to retard vibrations and produce light, without wasting energy in producing heat, as to increase slow molecular action and get the same results with a great loss in heat? Is it not easier to pull down than to build up? Can it be possible that there are not some of these ultra light vibrations reaching us from the sun that are not all slowed down, that are not all strained out by our atmosphere, which we can manipulate by physical means? This is apparently placing the cart before the horse, but there are push carts as well as pull carts, and I believe this method of light production to be worthy of serious thought toward practical ends.

The Chinese produced a civilization long before we built up a civilization, by almost opposite methods. They had their day and we are having ours, and we may yet learn to manipulate vibrations in a direction diametrically opposite to our present well established methods.

### How the New York, New Haven & Hartford Railroad Proposes to Check and Utilize Waste Electricity.

Arrangements are being made by the New York, New Haven & Hartford Railroad Company to install a large electric storage battery at the Union station in Hartford, Conn., to be used as an auxiliary to the electric plant at Berlin for the operation of the the third rail electric system to Bristol, and for the further extension of the system to Rockville to accommodate the continual growth of travel from the suburban towns east of Hartford,

A large storage room is to be built under the elevated tracks adjoining the Union station. It is designed to receive the overflow of electricity which is not used by the cars, for, as often happens, the dynamos in the power house at Berlin are in operation when no cars are running on the system and all of the current now goes to waste.

It is intended that the new storage battery will absorb all of the spare electricity and apply it to the propulsion of cars when the current falls below the fixed standard, and especially in starting cars out of the Union station. An effort will be made in the installation of the battery to prevent serious losses of electricity which are now going on in some mysterious way, which the electricians of the company and experts who have been called in, have been unable to trace.

An officer of the company said that the losses

of electricity from the third rail system have charged the semaphore signals along the line, in the vicinity of the third rail, to such an extent that they are operated almost entirely by these stray currents instead of by their own chemical batteries. Speaking of the improvements which are being made in the application of electricity to the operation of railroads he said that where the third rail has been placed outside the track it has given better service, as in the case of the intramural railway at Chicago Fair in 1893, and the present system in use on the Brooklyn bridge. With the third rail between the tracks there is always danger of accidents occurring to a train, especially a freight, by a brake beam or other part of a car dropping onto the middle rail and carrying the current into the car and spreading it through the train.

With the third rail on the outside of the track regular freight and passenger trains may be run in the ordinary manner with steam without affecting or interfering with the electric system whatever.

#### **ELECTRIC TRACTION IN PARIS.\***

Many of our readers are aware of the rapid strides which the trolley system of electric traction has made in France. Since 1889, when the first line of this kind was laid, nearly every large town has adopted it, and there are now about 1,500 miles of trolley line in France. Despite the very many, and admitted, advantages of this system, a number of large towns, including Lyons, Nice and Bordeaux, have changed over, or are doing so, from the trolley to the conduit system, and in each case the same company has been given the contracts for the carrying out of these changes. The length of the line in Lyons is 8,600 meters (2.24 miles), and is in actual operation; whilst in Nice and Bordeaux the new lines are in construction, the lengths of line in these towns being 6,000 meters (3,73 miles) and 4,000 meters (2.49 miles) respectively.

In Paris some faddists thought, and these are the ones which prevailed, that the overhead trolley system disfigured the beautiful appearance of their public streets. Their objections have not carried permanent conviction for new lines recently opened and other lines now in construction are adopting the trolley system. The new line between the Bastille and Charenton opened up by the General Tramways Company of Paris is worked over nearly its entire length by trolley lines. In fact, of the 6,200 meters total length of line, 5,300 meters are trolley, and of this 3,500 meters are in Paris itself. The remaining 870 meters, divided up in two sections, one near Dumesnil, the other near the Place de la Bastille, are conduit lines.

The favor in which the new lines are held appears to be very high indeed. The suburbs have been made especially accessible, a fact whose appreciation is shown in the extraordinary increase in the number of daily passengers carried by this line before the transformation and now-from 6,000 to 30,000.

There are no fewer than ten different systems of mechanical traction in actual operation in Paris, but no one of them combines the conditions for rapid and frequent service with economical working and a tolerable remuneration to the shareholders. The experience of conduit construction in Washington, Budapest,

New York and Brussels is not unknown to French engineers, but its close study has been hindered by the large number of trolley lines already in existence in different parts of France. The main object of the present article is to explain a new system of conduit traction which has just been put in operation in Paris.

The General Parisian Tramways Company obtained a concession in December, 1897, for a line between Saint-Ouen and the Champ de Mars. By the conditions of the specifications. "underground electrical conductors" had to be used in that portion of it running through Paris, namely, from the Asnières gate to the Military School. The company were allowed to extend the line beyond the Gare Montparnasse, and it decided to extend right on to the Place de la Bastille, so that its conduit line might be operated by three distinct, lines: (1) On the Saint Ouen-Champ de Mars line; (2) l'Etoile-Gare Montparnasse line, and (3) on the Gare Montparnasse-Place de la Bastille line. The total length of these three lines is about

the rail head, because the wheels roll upon it. It must also be strong, and have considerable width at the point where it must be supported: with these conditions a mechanically satisfactory switch will give a slot of 14 in. to 2 in. at the point. The difficulty has been overcome in the Paris construction in a manner which will be described.

In the actual construction the two conduits are interiorly placed. The rails are held to gauge by tie-rods spaced every 2.10 meters, and the interior slot rails are similarly tied together. The details are very much the same as in other conduit systems. The laying of ordinary track is clearly shown in Fig. 1. The metal-work is tied together and accurately gauged. forms are then put into position and the conduit walls built up with concrete. The wooden road bed is then laid down, and the track is completed. Despite many extraneous difficulties which arose during construction, 100 meters of double track could be laid per day.

The above method of construction ensures

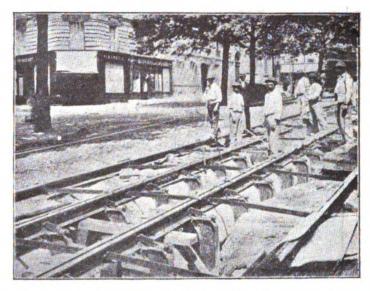

FIG. 1.—VIEW SHOWING CONDUIT LINE IN COURSE OF CONSTRUCTION.

7.5 miles, the lines (2) and (3) being formerly horse lines.

The conduits formerly built have all been with the center slot. The type of construction is that in use on the Metropolitan Railroad of Washington, the difference being that the cast-iron insulator shields are bolted directly to the bottom flange of the slot rail and the insulator pits are covered with a castiron plate, this being low enough to allow its being paved over. This avoids the use of manholes, against which there are many strictures.

In spite of strenuous efforts to do so, it was found impracticable, owing to the wooden payement, which wears so rapidly, to continue this central-slot construction in Paris. The proposition to add still another rail in the center of the track was therefore looked on decidedly askance, and finally the side-slot conduit was settled on. The chief objections to this system are: (1) The increased importance of slot closure, since the wheel flanges and plow must pass into the slot; (2) the whole weight of the car traffic is borne by the conduits, necessitating much stronger construction; (3) the splash of mud and water from wheels renders insulation of plow more difficult, and (4) it is absolutely impossible to make a really satisfactory slot-switch.

The last objection is very serious. A wide slot is necessary for the wheel flanges, and the upper face of the switch must be flush with great solidity. The swelling of the wood blocks will not affect the width of the slot, and the conduit is able to resist very great pressures; but not so for the rails. These, not being supported on a concrete bed, have experienced slight tilting. The use of wood pavement introduces the most complicated problems to the traction engineer; one never knows what bizarre effects may be produced. The inherent difficulties of the side-slot switch are avoided by the device of deflecting the slot to the center at such points. This construction is clearly indicated at the Etoile-Montparnasse terminus, Fig. 2, and represents a design which has been in use with success on the lines of the Lyons Omnibus and Tramways Company. The slot and track switches are thrown into position together by a pull on the detachable switch lever placed outside of the track. The arms which push the slot tongue are inclined to the slot. The plow in passing pushes them back under the slot-rail, the force required to do this being so very slight that there is no danger of damage to the plow or the carrier.

Across the Pont d'Alma, where the line crosses the Seine, the height of the masonry necessitated the construction of a special form of conduit, represented in Fig. 3. It consists of cast-iron tubes, strengthened by an exterior web every meter length. A special Z-bar is bolted to steel plates on the tube forming the slot rail. The rods are held in position by special

<sup>\*</sup>From the "Electrician," London.

steel castings acting as tie-rods. This construction necessitates the conductor bars being raised about 12 cm. (4%) above their level in the normal conduit. Special means are therefore required to raise or lower the plow for pasage over this bridge, independently of the arrangements for passage from the conduit to the trolley line.

The solution to the latter problem, obtained

These links absorb all the joltings and rough treatment of the rails, the mechanical strength of the springs being then unimportant, their function being simply to press the slots lightly against the conductor rail. The advantage of being able to raise or lower the plow at any point on the line had, in this design, to be sacrificed, though this advantage is probably exaggerated, for all that is really required is to

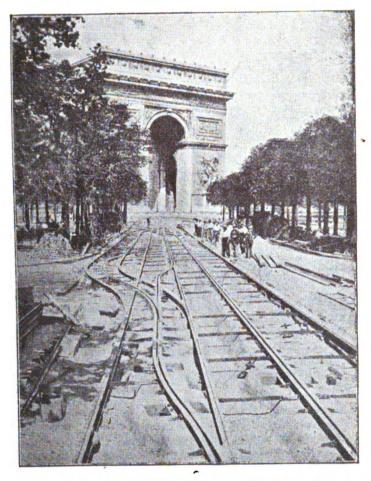

Fig. 2.— View of Etoile-Montparnasse Terminus, Showing Special Deflecting Device.

by arranging to attach or detach the plow, as the case may be, and in actual employ on two lines in the United States, is far too primitive to be satisfactory in cases where there is a frequent service. At Berlin, Brussels, and more satisfactory still, at Budapest, the most practical method was found to consist in providing

be able to make these changes at the junction of trolley and conduit sections.

The necessity for making a slot opening wide enough to permit of the free passage of the plow, and which could be rapidly opened or closed, was apparent. In the slot are placed two cast-steel covers supported on the one side

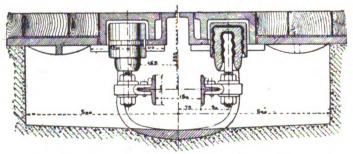

Fig. 3.—Shallow Conduit on the Pont d'Alma.

means on the car for raising or lowering the plow when necessary. The width of the slot required for this purpose becomes a very important consideration, and the design of the plow itself becomes serious. After careful consideration, it was decided to adopt the method now in use in Washington. This consists in making the plow in the shape of castiron shoes, which are pressed sideways by light semi-elliptic springs and supported on horizontal links which limited their outward play.

by a cast-iron frame and the ends by angle irons bolted to the slot rails. These covers are raised by a single motion of a removable lever outside of the track. The use of counterweights simplifies this operation. Sheet-iron guides are fastened to the conductor rails, and direct the shoes when the plow is lowered. The covers are opened by the conductor, who also raises or lowers the plow from the side of the car.

The most difficult problem consisted in the

design of the carrier. The conditions which this had to fulfill were: (1) The plow should be able to slide laterally right across the track; (2) it should be capable, when in its central position, of being withdrawn or introduced, as the case may be: (3) it should be raised or lowered from each of its side positions the necessary distance between the height of the conductor rails and the shallow conduit of the Pont d'Alma; and (4) at the contact points of trolley and conduit lines the same operation of raising or lowering the plow should also automatically change the circuits. The necessity for this change arises because the conduit circuit is a completely insulated one, while on the trolley the return is by the rails.

This plow is raised from its central position by a screw bolted to the side-bar of the track, and turned by the controller handle which simultaneously switches on the circuits by means of the bar attached to the commutators.

The "commutator" is in construction based on a car controller, with finger-tips, cylinder and spring to make a sharp break, so as to avoid destructive arcs. The entire lifting device differs from the type used on the Bastille-Charenton, Lyons and Nice lines, in that on these lines the lifting chains are attached directly to the plow. This cannot be used where the plow can shift the whole width of track, and the chains are therefore attached to a "cape," in which the plow slides. The design of the plow needed a special study.

There are numerous other points of interest connected with this line, but enough has been said to show that the line possesses many novel features.

### THE COMMON BATTERY SYSTEM.

[The New York Electrical Society held its 201st meeting on the 17th inst. at the Brooklyn Exchange of the New York & New Jersey Telephone Company. The Society was tendered a warm greeting by F. O. Runyon, chief engineer, and F. J. Southworth, traffic chief, who presented the following address.]

Gentlemen of the New York Electrical Society: In behalf of the New York & New Jersey Telephone Company, we wish to extend to you a cordial welcome, and to conduct you over the building, and describe such details of the plant as may require explanation.

All of the gentlemen present are doubtless acquainted with the history of the telephone: and it may be that all are familiar, in a general way at least, with telephone practice, past and present. But since the purpose of your visit is to inspect the common battery equipment recently installed in this building, it may not be amiss to briefly describe the common battery system and also the magneto system which has been superseded by the common battery in the Brooklyn, or as it is now called, the Main Central Office District.

By the common battery system is meant a system in which all the battery for supplying transmitting current for subscribers' telephones is located in the central office.

The common battery is also used for operating the signals at the central office, so that to call the office it is only necessary for the subscriber to remove the receiver from the hook. It also permits the use of signals in connecting cord circuits, whereby the supervision of connections is made automatic and is not attended by the continual listening-in of the operator to ascertain if the subscribers are through talking.

In this central office district to which about 3,000 subscribers are connected, the local battery has been removed from each subscriber's station, and current is furnished by a series of 11 storage cells of 1,250 ampere hours capacity located in the central office. Briefly, the method of operating for the old, or magneto system, is as follows:

The subscriber's station is furnished with a magneto hand generator, which, when operated by the subscriber, throws an annunciator drop at the central office. The operator makes the connection from the answering jack of this subscriber's line to the desired subscriber's line, using a pair of connecting cords. The pair of connecting cords also contains an annunciator drop which is thrown when the subscribers ring off, if they do not neglect that important item. If the desired subscriber's line is in another central office, it is of course necessary to complete the connection over a trunk circuit to that office.

All the large switchboards are of what is called the multiple type. In this type of board all of the subscribers' lines entering the central office appear in jacks about every 6 feet on the switchboard, so that all the lines are within the reach of any operator.

This central office has a common battery board of the multiple type, and on which the signals are lamps controlled by relays. A subscriber connected to this central office wishing to make a call removes his receiver from the hook. This lights a small incandescent lamp known as the line lamp, located next to the answering jack of this subscriber's line, immediately before the operator, who makes the connection with a pair of connecting cords in the same manner as in the magneto system, automatically extinguishing the line lamp. Each pair of connecting cords is provided with two keyboard signals which are miniature incandescent lamps, and by their being lighted or unlighted the operator can tell whether the subscribers connected on these cords have their telephones on or off the book. A lamp is lighted when the cord is connected to a subscriber's line and the receiver is on the hook. The lamp is extinguished while the telephone is off the hook, indicating that the line is in use.

In trunking between two common battery central offices this method of signaling is extended so that trunk operators are informed automatically when the trunk shall be disconnected. In the temporary conditions of affairs, when some exchanges are on the magneto system and some on the common battery system, the full advantages of automatic signaling cannot be obtained.

The underground cables carrying lines from subscribers' stations enter the building through iron pipes, and are connected to the main distributing rack on which the protective apparatus for the central office is placed. This rack has an ultimate capacity for 13,200 metallic circuits, and is arranged so that any pair of cable conductors can be cross-connected to any subscriber's line on the switchboard.

From the main rack, lead-covered, wool-insulated cables carry the lines to the intermediate distributing rack on the sixth floor, where the switchboard is located. The purpose of the intermediate rack is to enable subscribers' lines to be arranged in such groups on the switchboard as may be desired. On the same floor is a relay rack upon which the relays controlling the line and other signal lamps are placed. From the intermediate rack lines are carried through the multiple board in the less contains.

ing 64 wires each, with silk and cotton insulation. Cables containing 84 wires each also run from this rack to the answering jacks and signals.

The switchboard and auxiliary apparatus is designed for an ultimate capacity of 4,900 subcribers' lines and 950 trunk lines. It is at present equipped with 3,000 subscribers' lines and 500 trunk lines.

The repeating coils in the cord circuits are placed on the rack in the power room: in which is also located the units for charging the storage battery, the storage battery itself, and the motor-generators for ringing telephone bells and for other signaling purposes.

The storage battery has sufficient capacity to supply current for two or three days in case of a break down, and the charging sets and signal machines are in duplicates.

The power room also contains the wire chief's desk, to which all trouble is reported and from which trouble is located and the necessary directions given to the maintenance force in order to enable them to clear it.

The main operating room contains the main switchboard, the toll board and also desks of the manager, chief operator, etc. At the toll board calls for all points outside of Brooklyn and Manhattan Boroughs are handled.

#### CENTRAL STATION HEATING IN CON-NECTION WITH ELECTRIC LIGHTING PLANTS.\*

BY W. H. SCHOTT, Chicago.

One year ago we listened to a paper by Mr. J. H. Harding, on the subject of utilizing exhaust steam. This paper created more or less interest upon this subject and started a great many of us thinking.

In every manufacturing plant the shrewd manager is always trying to find some way of utilizing everything in the form of a byproduct that they may happen to have in their particular line and the up-to-date electric light manager should be on the same plane.

 $\Lambda$  few years ago investors believed that all that was necessary to draw large dividends was to purchase a certain kind of apparatus, put in most any kind of a steam plant and they would have a complete station and as soon as the light was turned on the dividends would begin to roll in, but later on some of these same investors found that instead of having a gold mine they were loaded with an elephant. They had been led to believe that they could put in any particular system, employ any novice to run same and it was all right, but later on they found that the expense kept constantly increasing, why they did not know. First one stockholder would try his hand at running it and then another and finally they would employ an expert to operate for them. This has been the experience of a number of plants throughout the country. Investors now know that in order to make an electric light plant pay it is necessary to construct it on the very best lines and then operate it accordingly. The average plant uses simple non-condensing engines and as a matter of course has a large number of heat units constantly going to waste, these heat units should be utilized and in most cases can be utilized if the proper apparatus is installed. What to install is an engineering problem that should be passed upon by some one competent to judge.

Within the last few years a few plants throughout the country have installed exhaust steam systems for heating, trying to secure a new earning power after having utilized the steam for the purpose of driving their electric load. After my own investigation of both the exhaust and hot water systems I was convinced that for certain cases the exhaust steam, either using back pressure on the engines or a vacuum pump, as the case might be, would be all right for certain cases, but where it required an extensive system to cover scattered areas it was impractical on account of the heavy investment required. But with the hot water system in towns where the business was located within two miles of the power station it could be taken care of from one power house at a minimum cost compared with a steam plant. The hot water system can be installed more cheaply than the exhaust steam as smaller pipes may be used to do the same amount of work, they repuire less expensive insulation, on account of lower temperatures the expansion is not so great, consequently less expansion joints are required, and with the hot water system heat can be stored up during such times when a surplus of steam exists and utilized when the amount of steam going to waste would be insufficient to do the required work.

To the consumer in addition to offering a uniform heat you can offer hot water for bath and laundry purposes, which will secure at least 30 per cent, of the business.

The average electric light plant in our smaller cities have had as a basis of starting a city contract. In this day and age we have to realize that we must put our plants where we are independent of a city contract, so that in case it is lost our business has not been destroyed and investment gone, and I do not know of a better way to do this than to put in a heating plant to utilize the exhaust steam, which is our by-product and by the proper disposal will increase our earning power and secure our investment and at the same time in so doing you are establishing something which every city is bound to have, namely, a central heating station.

## MODERN DEVELOPMENT IN A. C. SERIES ARC LAMPS.\*

BY R. FLEMING, Lynn, Mass

The development of arc lighting by means of alternating currents has been, all things considered, extremely slow. This is especially the case with arc lights in series.

Series lighting by direct current has, for many years past, reached a degree of perfection which, it is doubtful, can be improved upon, especially as regards the method of generating and distributing the current. Even in the years gone by, when methods and apparatus were crude, it was possible to obtain reasonably good services from such apparatus as could be secured, even taking into consideration, the fact that the attendance and care which the apparatus received was such as could be given by an extremely poor class of help. Now, however, men as well as methods have improved, and it is possible even for the small est central station to have its apparatus cared for in the most thorough manner. This, too, is made easier as the question of insulation and the handling of high potentials is now extremely well understood.

<sup>\*</sup> A paper read at the eighth annual meeting of the North-western Electrical Association, Milwaukee, Wis., Jan. 18, 1900.

<sup>\*</sup> Paper read at the eighth annual meeting of the Northwestern Electrical Association, Milwaukee, Wis., Jan, 18, 1900.

But even with the most perfect style of direct current apparatus obtainable there is yet a great deal to be desired in the way of flexibility of operation. It is necessary for high potential arc lighting work to have a small generating unit of comparatively low efficieny; this in turn to be driven by a small engine of low efficiency or a line shaft of still lower efficiency or by a synchronous motor, which latter method also has its disadvantages. It has long been the "dream" of a great many to be able to design a central lighting plant capable of furnishing all manner of light and power from a single unit or a single class of units of a size large enough to enable them to be operated under the most favorable conditions and at the highest possible efficiency, electrically and mechanically. While limited to direct currents for street lighting and series are lighting in general this "dream" was not easy of fulfillment.

The method of driving direct current are generators by means of synchronous motors supplied with current from alternating generators can hardly be called a method of lighting by means of alternating currents, being a complete regeneration of the current, and in fact, has many of the limitations of a system of are generators driven by small steam units. It is of comparatively low efficiency: there is a large amount of moving machinery that is quite complicated, requiring a large amount of floor space in the central stations as well as a large amount of extra attendance.

Series are lighting from alternating currents is not by any means of recent date. Experiments in this direction have been carried on from time to time ever since the oldest and crudest of alternating generators have been made.

Until recently, the most successful method was that of using a special alternating generator designed to have extremely high armature reaction separately excited and supplying open are alternating lamps. This method had all the disadvantages of a direct current system of distribution as well as a great many others inherent in the system itself. The generator, while theoretically ideal, was a very difficult machine to operate, and was of low efficiency. The power factor of the system was also low. The lamps were of a very crude design and extremely noisy; the light given off was of a poor quality and the operation of the lamps was anything but perfection.

Several schemes of supplying alternating arc lamps in series from constant potential circuits have been proposed from time to time, and several have been supplied to the market with varying 'degrees of success, few, however, reaching the point of becoming of any extended application, and most of them died in their infancy.

The advent of the constant current transformer and the alternating enclosed lamp have changed the whole aspect of series are lighting from alternating current circuits. With these transformers, it is possible to do anything that can be done with any form of direct current are generator. The regulation is as good or even better that can be obtained from these machines and this, too, is obtained without the use of complicated external means of accomplishing this end. These transformers possess the quality of "inherent regulation," which we occasionally hear so much talked about to a higher degree than any other class of apparatus made.

The principle on which the transformer operates is that beautiful one discovered and patented by Elihu Thomson a number of years ago. This was first brought to the attention of the public by his classic experiment with the floating incandescent lamp. No one can help being struck by the beauty and simplicity of this experiment.

In a constant current transformer the simplicity of the floating lamp is very nearly duplicated, except that the necessary leads are used to make connection with the moving coils, but these are so arranged that they are of the utmost simplicity of construction and in no way liable to become deranged.

In the practical application, all these transformer parts are reduced to a minimum and it is hardly possible to conceive a piece of apparatus that will accomplish so much with such an extremely simple arrangement of parts.

Here, it is perfectly feasible to completely short circuit the secondary winding of the transformer and without any further manipulation, apply the primary current at full potential without in the least damaging the transformer and with extremely slight disturbance to the circuit to which it is attached.

This device has several advantages over a direct current arc generator as a means of supplying constant current. In comparison, the efficiency is very much higher, even after taking into consideration the losses in the alternating generator, the combined losses being very much lower than is possible to obtain with the direct current machine of the best possible type. The alternating system admits of the use of extremely large units designed for the very highest efficiency and solves the problem of doing all classes of work both lighting and power from a single class of generators.

To appreciate the advantage of this thoroughly, it is only necessary to bring before your mind a few of the old time stations in which it was possible to find generated probably four or five separate and distinct classes of current for as many separate and distinct classes of work. We possibly had both alternating and direct current generators for lighting and a separate class of direct current generators for power work and in all probability two or more classes of arc generators, some supplying street lamps with 9,6 amperes, others supplying commercial circuits with a lower current value. All these units being of small size and mostly of a very inefficient type driven by inefficient steam engines and power consuming line shafts and belting.

The modern station, however, is a marked contrast to the above. Here, we have in the larger stations not more than five or six units of large size, the capacity being governed by the local conditions. These units are generally of the polyphase alternating type driven by a uniform design of compound or triple expansion steam engines, all of the highest possible efficiency. From these units power is supplied for all classes of work, transformed to suit whatever the conditions may be, whether for power, incandescent lighting or arc lighting-commercial arc lighting being done from the multiple circuits and street lights being supplied in series from constant current transformers. Nothing can be more simple, and I doubt if it is possible to obtain a more efficient and more satisfactory installation than one of the above type.

Regarding the lamps that have been designed from time to time for use on series alternating circuits—and their number has been legion; yet the lamps that have gone into actual commercial operation have been extremely few.

The difficulties in the way of making a satisfactory series alternating lamp have been very considerable. Several problems entering into the design which have made progress extremely slow. Owing to the nature of the current applied to the lamps, it was difficult to overcome the noise and vibration in the mechanism and the behavior of the arc itself, too, was extremely annoying, the quality of the carbon entering largely into the problem making experiments often hopeless. Altogether, experimental work on alternating lamps is the the most annoying and most unsatisfactory that one could possibly engage in. Now, I think however, that the problem has been fairly well solved, and even the very crudest of laboratory experiments have developed into a thoroughly satisfactory and commercial piece of apparatus, capable of doing its work equally as good if not better than the best direct current apparatus of a similar nature, it being only necessary to observe a very few and simple precautions to get results that are, to say the least, highly gratifying and satisfactory, both from an engineering and commercial point of view.

There are now in operation several thousands of these lamps in such positions, that if the work was not satisfactory they would not be tolerated for a moment.

That the alternating lamps are successful as a means of street lighting, goes without saying. This is testified to by the large number which have been placed in operation during the past year. The objection that has been held against the alternating lamp, for a long time—that they did not give nearly as much light as the direct current lamps, has not been substantiated, for with an equal amount of energy, the alternating lamp is fully the equal if not the superior of the direct current lamp, especially for street lighting, owing principally to the improved distribution of light from the alternating arc.

This subject has been gone over fully during the past year and is now pretty well understood and no fears need be entertained that the alternating lamp is not efficient.

After development of any device or system in the laboratory, the next step is the practical application of such a device or system and there is often more credit due the man who first risks his money and his reputation for good service to his customers than to the man who does the actual development of such a device or system and in this particular instance too much honor and credit cannot be given to the management of the Hartford Electric Light Company, who, in view of the fact that here was a system commercially unknown and untried, risked an expenditure of a large amount of money and time, and bore with a considerable amount of trouble and experimenting and were broad minded enough to see that the system had very great possibilities, and in case success offered them very marked advantages over their old system or any system that they had then investigated. But withal, it is only justice to the system to say that the loss from lights out was extremely small. Minor troubles of course developed and were remedied in short order and now that the installation is complete with the most modern apparatus, the operation is satisfactory in the extreme. The capacity of the installation is in the neighborhood of 700 lights with practically no relay in case of accident, the trans-

formers being sub-divided and placed in substations, yet so much confidence had they in the system that they did not consider it essential to provide against accidents or breakdowns

It may be interesting in this connection to know one proposition that has been made. It is to mount a tranformer on a truck, this is to be stored at some convenient point, when, in case of accident, a team can be hitched on and driven to points where trouble has occurred.

So far, this has not been put into practical operation, yet it has all the essentials of success and is a scheme that has considerable merit and in my mind would be an excellent means of providing relay in case of break-The possibility of breakdown, however, is extremely remote as, owing to the construction of the transformer and the provision made against accidents due to either internal strains on the insulation or the possibility of damage by lightning, the probable use of a relay unit would be extremely limited.

It may be interesting, from a financial standpoint, to learn that a certain lighting company estimates that, owing to savings made by the use of this system over their old system of street lighting by means of open are lamps supplied by the old style are generators, these latter being driven by small engines and line shafting, the new system will pay for itself within two years, that is to say, by the sayings made, they will be enabled to charge the first cost of the entire system off their books. This, in many respects is a remarkable statement to make, but I have it from the officers of the above company that this is a very conservative statement, and, as a matter of fact, will be bettered to some extent.

Regarding the cost of operation of these lamps, which perhaps is the most interesting subject for the central station, the cost of operating multiple lamps, both alternating and direct is very well understood owing to the fact that these lamps are in very extended use, and there is scarcely a central station in the country which has not a comparatively large number of either one kind or the other. The cost of operation of the series alternating system is very nearly the same as regards the labor for trimming and the cost of carbon as in other enclosed arc lamps. It is very difficult to compile any definite figures on this subject or to make any definite statement as the costs vary within extremely wide limits dependent upon local conditions.

The actual figures in detail are not available but in a number of cases it has been estimated that changing over from the old method of lighting to the new, a saving of from \$8 to \$10 and in some cases as high as \$12 per lamp per year has been made. The principal saving lies in the fact that the cost of trimming and maintenance of the lamps is reduced wonderfully. With the new system one man is abundantly able to take care of 600 lamps where it required six men to take care of an equivalent number of lamps on the old system. In this way it is possible to employ a much higher grade of workmen, thereby insuring that the lamps are properly cared for, which, with the enclosed lamps, is a very important item as in this point alone lies a considerable portion of the success of this class of apparatus. A careless lamp trimmer can easily spend his salary many times over and the operation of the lamps trimmed by such a man will be anything but perfect. With careful handling, the life of the lamps will be extremely uniform and need not be

trimmed oftener than once per week under the most severe winter conditions, whereas, with careless trimming, the globes are not made tight, the carbons are cut of varying length, thereby destroying the principal advantages of the enclosed system.

The question of globe breakage is also a much mooted one. This expense also is variable as the following tables show. The figures given were received from a number of representative central stations and isolated plants throughout the country. They cover nearly all forms of enclosed arc lamps, and also represent nearly all degrees of care used in trimming.

INNER GLOBE BREAKAGE.

Direct Current	Arc	Lamps.
----------------	-----	--------

D. C. C.	Amperes	Per trim, per cent.
$\Lambda 650$	` 5	214
B 270	7	51.
C 260	6.6	434
D 825	6.6	3.
	Commmer	
E 3000	City Mark	
	/ Residentia	1 2 to 3
F 150	6.6	31/6
G 61	6,8	. 18
H 175	5	1
I 50	4.8	6
J 600	6,6	6.6
K 200 mult	. 5	5140
L 10	5	51. <u>5</u>
M 1800	416	41.5
N 160	214	Satisfactory.

INNER GLOBE BREAKAGE.

#### Alternating Current Arc Lamps.

A	lt. C. C .	Amper	res.	Per trim, per	r cent
0	35	6.6	(1 globe	in 4 months)	.18
P	47	6.6			41.4
Q	1:27	6.6			3
R		6,6		About	4
S	Sin alt.	mult, 6			5L.,
Т	1200 **	7.5			516

It will be seen from the foregoing that no definite figures can be arrived at. A great deal depends upon the care with which the trimming and the cleaning of the globes is performed. The energy consumed by the lamp seems to have but little bearing on the globe breakage, as the life of the globes on lamps burning at 7 or 7½ amperes and consuming 500 watts or over, is as good as those on the 41 or 5 ampere lamps that only consume 350 to 400 watts.

The question of the proper amount of energy that a street light should consume has provoked a good deal of discussion in the past nor does it seem to be permanently settled yet, although a current of 6.6 amperes with an arc adjustment of 70 volts seems to be almost universally satisfactory. The volume of light from such a lamp is certainly large enough for general street illumination, and even for certain severe conditions where a greater amount of light is required, it is a far better plan to increase the number of lamps rather than increase the power of the lights themselves by increasing the energy supplied to each. The alternating series lamp consuming 425 to 450 watts seems to be a satisfactory unit, both to the central station managers and city officials, wherever they have been used, giving an almost ideal distribution of light of the finest quality, being remarkably steady and of good color and penetration.

#### New Telephone Cable.

A scheme is being mooted to lay a telephone cable across the Bay of Fundy, from St. John, New Brunswick, to Digby, Nova Scotia. The distance to be covered by the cable is 45 miles, and it will connect at Point Prim, Digby county, with the wires of the Valley Telephone Company of Nova Scotia.

#### CANADIAN NOTES.

(From our Ottawa Correspondent.)

The owners of the Velvet mine propose constructing a railway from Rossland, British Columbia, to the mine. It has not yet been decided whether the motive power will be steam or electricity, a director of the British Electric Company now being on his way from England to determine this point.

At a meeting of the city council of Toronto, Ont., held on Jan. 22, a notice was given by the mayor that he would move that the council petition the Parliament of Canada, at its ensuing session, to pass an act to authorize the Post-master General to acquire all of the existing telegraph and telephone lines and systems, and make such extensions to and operate the same in connection with, and as part of, the postal system of Canada, or in the alternative to construct a new system or systems of telegraph or telephones, and operate the same, and that the co-operation of the cities, towns and other municipalities of the Dominion be invited to the end that an act may be passed for these

A report comes from Palm Beach, Fla., that Mr. A. F. Gault and Mr. Wm. M. Doull, both of Montreal, have returned from a trip to Cuba and that these gentlemen have secured control of the surface railway of Havana. As a matter of fact the concessions, in which the Canadians are interested, were obtained months ago, and in this company Mr. Doull is a direc-

It is understood that the Montreal Electric Street Railway Company is negotiating with the Chambly Water & Power Company for the supply of electric power in the operation of the railway company's system, and that this corpo-tion will acquire a good sized lump of the Chambly Company's stock.

A new method of generating water gas for lighting and heating has been discovered by W. H. Cone, of Ottawa, and the discovery has already been put to practical use and an apparatus installed in the city for making the under the new system. By this new method hydrogen is generated by the decomposition of water by electricity and made to permeate coal oil or any heavy carbon oil. In this way the hydrogen becomes carbonated, and when mixed with air makes an illuminating gas of first quality. It can be produced at 40 cents per quality. It can be produced at 40 cents per 1,000 feet. While Mr. Cone will not yet make known the secret of his method for manufacturing the gas, there seems to be little doubt as to the success of his system. A company is now being formed, with a capital stock of \$100,-000, to operate the system. Mr. Cone is a chemist, and stumbled upon this new method of generating the water gas while he was endeavoring to find a means of generating oxygen for medicinal purposes.

Electrical industries in Canada, have fully shared in the general prosperity that is now felt throughout the Dominion. It is stated that the leading electrical manufacturing and supply companies report that the volume of their business for 1899 exceeded by upwards of per cent. the business done during 1898. More than half of the output of these companies was applied to the extension and improvement of the existing plants, the bulk of the machinery sold being for lighting and power purposes. Many electric lighting companies took advantage of the prosperous times to discard old-type machinery and replace the same with new apparatus of higher efficiency. Improvement and development have been quite as marked in the commercial as in the mechanical field. The business done has been so large and so profitable that the stock of the two leading manufacturing companies in the two leading manufacturing companies. Dominion has risen 50 points during the year, and further advances are predicted. The workshops of the electrical manufacturies are to be crowded with orders to such an ex tent that no promise of delivery at a specified time can be made, and prices are firmly main tained. The outlook for the current year is everywhere regarded as most promising.

#### AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

#### The Council Vote to Hold the Next General Meeting in Philadelphia.

The 139th meeting of the American Institute of Electrical Engineers, was held at 12 West 31st street, New York, on Wednesday, January 24, President Kennelly in the chair. 75 members and guests being present. A paper was presented by Mr. Fitzhugh Townsend, of New York City, on "A New Method of Tracing Alternating Current Curves," The discussion was opened by Dr. Sheldon and continued by Mr. C. P. Steinmetz and Dr. M. I. Pupin. A paper was also read by Mr. Chas. P. Steinmetz, of Schenectady, entitled "Notes on Single-Phase Induction Motors and the Self-Starting Condenser Motor." Messrs, Pupin, Bradley and others took part in the discussion.

At the meeting of council held in the afternoon, the President announced the death of James Hamblet, formerly a vice-president and manager of the Institute, also of Samuel Dana Greene, who at the date of his decease was serving the first year of his term as manager. The President stated that he had appointed committees to prepare suitable resolutions and memorials to be printed in the Transactions,

It was voted to hold the next General Meeting of the Institute in Philadelphia which should adjourn to meet in Paris on August 16. The date of meeting in Philadelphia was not fixed. Over 60 members have promised to attend the European meeting. An appropriation of \$500 was voted for erect-

ing shelving and the binding of periodicals now on file at the Institute rooms.

The following associate members were elected:

Bernard A. Behrend, Erie, Pa.

Edmund Walter Beveridge, Bombay. India. John Denham, Cape Town, South Africa.

Paul H. Evans, Harry B. Niles, J. Harry Shearer, Robert R. Shephard, Milton T. Thompson, Mexico City, Mexico.

George Greenwood, Jalapa, V. C., Mexico. Gwyllym R. Holmes, Baltimore, Md.

J. E. Hindon Hyde, Benjamin Magnus, New York City.

Alois J. J. Pfeiffer, Milan, Italy.

Charles Oscar Poole, San Francisco, Cal.

Wilfred Van Nest Powelson, Schenectady,

Frederick Alexander Saylor, Reading Pa. R. L. Selden, Jr., Deep River, Conn. Max W. Zabel, Chicago, 111.

The following associate members were transferred to full membership:

Walter Donglas Young, Baltimore, Md. Robert T. E. Lozier, New York City. H. A. Storrs, New London, Conn.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended January 20:

Argentine Republic, 305 cases, \$15,031; Barcelona, 46 cases, \$5,155; Berlin, 1 case, \$5; Brazil, 10 cases, \$227; British Australia, 1 case, \$198; British East Indies, 17 cases, \$607; British West Indies, 22 cases, \$228; Central America, 117 cases, \$840; Genoa, 4 cases, \$8,000; Hamburg, 99 cases, \$2,722; Havre, 248 cases, \$16,164; Japan, 51 cases, \$8,408; Liverpool, 139 cases, \$5,567; London, 402 cases, \$15,662; 7 electrical carriages, \$823; Nice, 66 cases, \$11,283; Peru, 21 packages, \$657: Santo Domingo, 27 cases, \$1,018; Southampton, 88 cases, \$3,703; Stockholm, 1 case, \$20: Venezuela, 21 cases, \$559; Vienna, 5 cases, \$195.

The following were the exports during the week ended January 27:

Alexandria, 1 case, \$20; Amsterdam, 1 case, \$125: Argentine Republic, 288 cases, \$24,364: Australia, 2 cases, \$1,133; Brazil, 8 cases. \$460; Bristol, 62 packages, \$4,000; Brussels, 1 package, \$22; Central America, 3 cases, \$101; Cuba, 140 cases, \$4,449; Dutch Guiana, 1 case, \$50; Fredrickstad, 5 cases, \$140; Glasgow, 6 cases, \$211; Hamburg, 139 cases, \$10,819; Leeds, 3 cases, \$181: Liverpool, 6 cases, \$223: Mexico, 12 cases, \$1,226; Milan, 19 cases, \$1,716; Newcastle, 5 cases, \$670; Riga, 7 cases, \$1,558; Rotterdam, 1 case, \$15: Southampton, 2 cases, \$40; Tasmania, 53 packages, \$3,310.

#### LEGAL NOTES.

Justice Wilmot M. Smith, of the Supreme Court at White Plains, N.Y., has decided that the New York, Westchester & Connecticut Traction Company has no rights in the town of East Chester or the village of Bronxville. This gives the Union ("Huckleberry") Railway Company the right to proceed and complete its road from Mount Vernon to White Plains, a part of which, from Scarsdale to White Plains, is already built and in operation Plains, is already built and in operation.

The Supreme Court recently handed down a decision in the Des Moines, (Ia.) municipal electric light case. The court holds that the city of Des Moines, in contracting with the McCaskey & Holcomb Company to erect a city electric lighting plant, exceeded its proper authority in that it engaged in a contract which imposed on the city liabilities in excess of the constitutional limit of debt. The contract is, The contract is, therefore, held null and void,

## PERSONAL MENTION.

Mr. John J. Tonkin was recently selected as consulting engineer of the Murphy Safety Third Rail Electric Company of New York City.

 $\mathbf{Mr.~E.~W.~Goss.}$  for the past four years superintendent of the Middletown (Conn., Street Railway Company, has accepted the position of superintendent of the Milford, Holliston & Framingham Street Railway Company in Massachusetts.

Prof. David Edward Hughes, inventor of the Hughes printing telegraph instrument, now in use on all important Continental lines in Europe and on all submarine lines between England and the Continent, is dead. Prof. Hughes was born in London May 16, 1831, and was educated at Bardstown College, Kentucky. He was the inventor of the induction balance, and the discoverer of the microphone, now almost universally used as transmitter to the telephone. He was the author of numerous papers upon electricity and magnetism.

#### INCORPORATIONS.

The Washington Light & Power Company, Washington, Ind. Capital stock, \$21,00c.

The Fowler Electric Company, Fowler, Ind. -to operate an electric light plant. Capital stock, \$25,000. Incorporators: C. C. Curtis, H. B. Mersh. E. M. Campbell and J. W. Noel, all of Fowler.

The Seattle Electric Company, Seattle, Wash. Capital stock, \$6,250,000. Incorporators: Jacob Furth, M. Micken, T. Burke, C. J. Smith and R. V. Ankeny, all of Seattle.

The Maumee Electric Company, Maumee, O. to furnish electricity for light, heat and power. Capital stock, \$7,500. Incorporators: W. R. Tryon, W. S. Swan, G. B. Monen, A. C. Tryon and A. E. Tryon,

The Acme Electric Company, New York City-to manufacture and sell electrical apparatus. Capital stock. \$25,000. Directors: George H Crossman, Louis A. Jackson and Charles A. Secor of New York City.

The Cedar Rapids Electric Light & Power Company, Cedar Rapids, Ia. Capital stock, \$500,000. Incorporators: C J. Ives, I. B. Smith, J. H. Smith, W. G. Dows, W. D. Douglass and W. J. Greene, all of Cedar Rapids.

The Porter Motor Company, Portland, Me,-to manufac-

ture and deal in automobiles and motors. Capital stock, \$1,000,000. Officers: President, Major D. Porter of Boston, Mass.: treasurer, Dalton Fallon of Brookline

The People's Light, Heat & Power Company, Wilmington, Del.-to manufacture gas, steam and electricity for lighting, heat and power. Capital stock, \$2,000,000. Incorporators V. H. Conkle, T. F. Deegan, both of Philadelphia, Pa., and P. J. Ford of Wilmington.

The Coeymans Electric Company, Albany, N. Y.--to manufacture electricity for light, heat and power purposes in Albany and Greene counties. Capital stock. \$50,000. rectors: William F. Inman, John N. Drake, of New York City; John F. Montignani, of Albany; Levi E. Conyes and Charles L. Diston, of Ravena.

The Washington, Mechanicsville, Leonardtown & Point Lookout Electric Railway Company, Annapolis, Md.-to build an electric railway from Washington through Prince George's, Charles and St. Mary's counties to Point Lookout. Capital stock, \$1,000,000. Incorporators: C. R. Jones and F. R. Tenney of Philadelphia, Pa., J. T. Ballinger, G. F. Dyer and others of Maryland.

#### ELECTRICAL PATENT RECORD.

[ This department is edited by OSCAR A MICHEL, Solicion and Attorney for AMERICAN AND FORFIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N W., Washington, D C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A MICHEL Nos 302 301, Broadman New York City N. Y , or 639 F street, N W , Washington, D. C. Copies of any patent published c n be furnished upon p ment of ten cents. When ordering give name, date and tile of invention wanted.

#### LETTERS PATENT ISSUED JANUARY 25, 1900.

## ELECTRIC RAILWAYS AND APPLIANCES.

641,829. Electric Overhead Railway. Louis J. Bruns and Plans R. Ottesen. Hanover, Germany. Filed Aug. 15,

1899.

### GENERAL NEWS.

What s Going On in the Electrical World.

#### LIGHTING.

Abbeville, I.a.—J. Maxwell and W. Porter propose the formation of a company to build an electric light plant at this place.

Asbury Park, N. J.—A new electric lighting plant is contemplated for this city by Asbury Park authorities. It will be equipped with three augines and three dynamos of 70 lights' capacity; one additional beiler of 100 horse-power will also be required. Cost, \$25,000.

Baltimore, Md.—The Heiser Manufacturing Company intends installing a 200-light dynamo with wiring, etc. Address W. E. Heiser, president of the company.

Batavia, O — On February 3 the citizens will vote on the proposition to issue bonds to build an electric light plant.

Bloomington, Ind.—The citizens of this place are agitating the question of building a new electric light plant.

Cape May, N. J.—The citizens of this resort want the right to issue bonds for the construction of a municipal electric light plant.

Celina, O —The citizens of this place are agitating the question of erecting an electric light plant.

Central City, Col.—The Long's Peak Power Company will soon erect a new electric light plant for supplying electricity for light and power purposes to the towns and mines in this portion of the State. It will be located about 3) miles from this city.

Chasks, Minn.—This city by a public vote has decided to put in an electric light plant. Bonds will be issued for \$7,000, that being the estimated cost of the niant.

Chenoa, Ill.—The Chenoa electric light plant is to be enlarged.

Chittenango, N. Y.—Surveyor E. D. Smalley of Utica has been suggesting the establishment of a waterworks system and electric light plant in this place.

Coldwater, Mich.—The city council will soon purchase another dynamo for the city's electric light plant.

Covington, Kv.—Sealed bids will be received by the city clerk up to 5 o'clock PM, February 5, for the franchise or privilege of entering in and upon the streets, alleys and highways of the city, to erect and maintain poles, wires and appurtenances for furnishing electric ity to consumers for a term of twenty years from the date of the granting of this franchise.

Dongola, Ill.—This town contemplates putting in an electric light plant in the near future.

Grayson, Ky.—The citizens will vote on the question of issuing bonds to build an electric light plant.

Hagerstown, Ind.—Municipal waterworks and electric lights are improvements contemplated for this place the coming season.

Hoboken, N. J.—The Municipal Light, Heat & Power Company has applied to the common council for the privilege of erecting poles and placing conduits in the streets for supplying the city and citizens with light, heat and power.

Jennings, Lt.—At a recent meeting of the council B 8 Stearns was granted a franchise to put in an electric light plant here.

La Crosse, Wis —The proposition to construct a municipal electric light plant was carried almost unanimously at the recent election.

Lubec, Me.—The Sea Clast Packing Company contemplates the installing of a general electric system or independent plants, which ever may appear the most expedient, for the lighting of their factories in this place, for the coming season.

Ludington, Mich.—The common council has been petitioned by the residents of the city to order a special election on February 5 for the purpose of voting upon the proposition to issue \$25,000 in bonds for the erection of an electric lighting plant.

Mars Hill, Me.—There is talk of putting in an electric light plant at this place in the near future.

Bichmond, Ind.—The city council is in favor of the municipal ownership of an electric light plant.

Shepherdstown, W. Va.—Dr. A. S Reynolds of this place is making an investigation of the cost of an electric light plant with a view to operating the same hare.

Sherburne, Minn.—W. F. Brundage is looking over the field with a view to putting in an electric light

Shippensburg, Pa.—The citizens are agitating the question of issuing bonds for the purpose of erecting an independent electric light plant.

Spencerville, O.—The citizens will petition the council to put in an electric light plant.

Versailles, Ind.—Grant Johnson is the promoter of an electric light plant, which is to be erected here in the spring.

West Union, O.—Local capitalists are organizing to put in an electric light plant.

Winona, Miss.—A stock company with a capital of

\$21,000 has been formed by business men of this place for the purpose of erecting an electric light plant.

#### STREET RAILWAYS.

Atlanta, Ga.—A stock company, of which Attorney General Monnett is one of the incorporators, has just been organized to construct an electric road from this city to Douglasville, a distance of 45 miles.

Carthage, N. Y.—The prospects for a trolley line between Watertown and this place are said to be very encouraging.

Cleveland, O.—Cleveland promoters are interested in a new \$600,000 street railway project in Indiana. The road is to be 49 miles long and will run into Indianapolis. Capitalists of Kokomo are interested and also the United States Construction Company of this city.

Columbus, O.—The Lancaster & Newark Traction Company proposes to construct and operate an electric railroad line passing through the Licking reservoir and towns and villages that skirt its shores. E Rowles, S. B. Campbell, E. H. K.bbler and others are interested.

Fayetteville, Pa.—Amos B. Lehman of this city is interested in a company that is to be organized for the purpose of constructing an electric street railway between this place and Chambersburg.

Fitchburg, Mass.—Among the latest railway schemes is the opening of an electric line up Wachusett mountain, in which enterprise electric road men of this place and Leominster are interested.

Huntsville, Ala.—John H. Waters, treasurer of the Huntsville Railway, Light & Power Company, states that the company will probably run an electric railway to North Huntsville.

Nashville, Tenn.—J. S. Brown and others are interested in a proposed electric line in the northestern part of the city.

Neenah, Wis.—Preliminary steps have been taken for the organization of a company to build an interurban line along the east shore of Lake Winnebago from here to Fond du Lac.

Oil City, Pa.—The Oil City Traction Company has been granted a franchise and charter to build an electric street car line in this city.

Phoenix N. Y — Mr. Hart of Syracuse in the interest of the Oneida Lake Street Railroad Company is planning to build an electric road between this place and Syracuse.

Portland, Ind.—A company has been formed to construct an electric railway to extend from Huntington to this place. The line will pass through Kelso, Warren, Montpelier and terminate at Portland. The promoters are Mayor Z. T. Dungan, J. F. France and I. F. Beard of Huntington. Franchises will be asked for from the commissioners in Huntington, Grant, Blackford and Jay counties.

Richmond, Ind.—It is proposed to construct an electric street railway from this city to Eaton, O. The right of way has been secured and capital has been raised to build the line. Dr. W. Lowes and other D-yton capitalists are interested. The company will be capitalized at about \$200,000.

Tacoma, Wash.—The Dyea & Chilcoot Railroad Company proposes to build an electric road from Dyea to Chilcoot Pass, in Alaska, a distance of seventeen miles. Michael King is president and T. B. Wallace of this city is secretary.

Waterbury, Conn.—The Connecticut Lighting & Power Company is to open up a through trolley line from this city to Hartford in the near future.

Z snesville, O—A company has been organized for the purpose of constructing and operating an electric railway between here and Coshocton, the line is to run through Sonora, Esst Greenwood, Adamsville, O.sego and Piainfield. F. H. Southard, H. E. Burker and J. B. Wilson are the incorporators.

#### COMPANY MATTERS.

Allentown, Pa.—A movement is on foot looking forward to the consolidation of the interests of the Allentown and Kutztown, Kutztown and Fleetwood and Kutztown and Beading Electric Railway Companies. The men interested in the enterprise are leading citizens in towns along the route of the proposed roads.

Belvidere, Ill.—A. J. Stahl has purchased the stock of the Belvidere Light. Heat & Power Company. W. H. Schott and E. B Magill are also interested. The new company will enlarge the plant.

Cincinnati, O.—The Cincinnati Edison Electric Light Company has purchased property on Fifth street, for \$48,000 and will build a mammoth plant.

Easton, Pa —At a recent meeting of the city council representatives of the Easton Power Company stated that preliminary arrangements looking to the absorption of the Edison Illuminating Company of Easton, a rival, had been made and that the final transfer would take place February 1.

Fort Lee, N. J.—It is reported that the Bergen County Traction Company, which has owned the trolley through this place and the Riverside and Fort Lee Ferry Company have combined, and that both are being operated under the real management of the Third Avenue Road in New York, which, it is said, has secured a controlling interest in both the Fort Lee Trolley Company and the Fort Lee Ferry.

Mobile, Ala.—The Electric Lighting Company will

elect additional buildings for their power plant, adding an engine of 600 horse-power a d capacity for 6,000 additional lights.

Muncie, Ind.—Fire destroyed the power house, shops, harns and offices of the electric street railway system. Loss, \$93,000. The plant will be rebuilt.

New York.—The following electric car lighting and equipment companies were merged into one company last week with a capital of \$16,000,000: The Electric Car Light & Power Company, the Columbian Electric Car Lighting & Brake Company, the American Railway Electric Company, the United Electric Company, the Lindstrom Brake Company and the Railway Triplex Ticket Company. The new corporation will be known as the Consolidated Railway Electric Lighting & Equipment Company, and is incorporated under the laws of New Jersey. Mr. Isaac L. Rice will serve as president.

Troy, N. Y.—The E. G. Bernard Company has recently shipped an electrical plant for the Government Grounds at Key West, Fla. The plant will furnish lights for the fortifications and will supply current for firing the large coast defence guns at that station.

Watertown, N. Y.—The Black River Traction Company has purchased through C. M. Paris, water power at Felt's Mills for a power s'ation in that village.

Worcester, Mass.—The Worcester Electric Light Company is contemplating putting its wires within the lines of the business part of the city underground. It is desired to increase the capital stock from \$300,000 to \$400.000.

#### MANUFACTURING, ETC.

Birmingham, Ala—The Alabama Supply Company of this city wants the addresses of manufacturers of electrical supplies.

Ft. Wayne, Ind.—The Fort Wayne Electric Company will manufacture on a large scale Mr. Wood's new focusing arc lamp, a recent invention which possesses several advantages over the old lamp.

#### POWER AND TRANSMISSION PLANTS.

Athena, Ore.—A company of business men of this place have purchased a site up the Walla Walla River, seven miles above here, with the intention of developing and placing thereon an extensive electric plant. This power will be conveyed to Athena across the country by means of the usual overhead wires, and with it the town will be lighted and motive power applied for various mills.

#### AUTOMOBILES.

Akron, O.—An automobile patrol wagon has been built by this city and is said to be the first of its kind manufactured. The wagon weighs 5,500 pounds and is equipped with two four hp. motors. Its maximum speed is said to be 2) miles an hour. The wagon cost \$2 300. It is asserted that in a test the new vehicle ran through deep mud and up and down hill easily.

Boston, Mass.—The Colonial Automobile Company has recently turned out a novelty in the automobile line, in the form of a steam vehicle having three rear wheels, the center one being the driving wheel. Mr. Kent the inventor, believes that several difficulties are overcome by this arrangement and important advantages secured.

Bridgeport, Conn.—Ground has been purchased for the erection of a factory for the manufacture of automobiles and locomobiles. Upward of 3,000 hands will be employed. The name of the concern is the Locomobile Company of America. A. L. Barber, of New York, is president, and Dr. I. Dever Warner, of this city, is one of the backers. It is reported that Grover Cleveland and E. C. Benedict are also interested.

Chicago, Ill.—The Woods Motor Vehicle Company has recently completed two electric mail wagons which are to be sent to Washington. The postal authorities will test the new vehicles and report on the advisability of their use in the large cities.

New York.—President Clausen, of the Park Board, has granted permits for running automobiles in Central Park to Dr. William T. Jenkins. of the Health Board, and A. C. Miles—Last week Mr. C. A. Seaman purchased an electric automobile at the Bicycle and Automobile Show, which was shipped to Florida. The price is reported to be \$1.500.—The Automobile Company of America has recently secured the shops at Marion, N. J., which will be equipped with modern machinery for the production of automobiles.

Providence R. I.—An omnibus was designed recently.

machinery for the production of automobiles.

Providence, R. I.—An omnibus was designed recently by Frank Mossberg and his associates in the United States Automobile Company, and the intention is to have several of these vehicles running in Roger Williams Park and at Narragansett Pier next summer. The factory in Attleboro is too small for building motor vehicles and the company is looking for a building in this city or Pawtucket large enough for turning out at least two vehicles a week.

West Hartford, Conn.—Last week several residents of this place attended the Bicycle and Automobile Show at New York, with a view to buying an automobile to compete with the trolley line from Foot's Corner to West Hartford.

## MINES, ETC.

San Francisco, Cal.—The new mining camp of Cape Nome, under the Arctic Circle, will start in the spring with electrical mining machinery.

## THE TELEPHONE WORLD.

A hearing of considerable interest, says the Washington was given recently by the Commissioners to the Senate bill, 1235, "To permit the Washington Telegraph & Telephone Company to install, maintain and operate a telephone and telegraph plant and exchange in the District of Columbia." In the interests of the proposed company there were present: Hon. H. W. Rusk, George R. Webb, Samuel Ross, Sidney H. Brown and H. W. Webb, Mr. George W. Webb addressed the Commissioners principally in regard to the resources and efficiency of the corporations interested in the establishment of the independent telephone system, which is being introduced in a number of cities, and which the proposed company is anxious to establish in Washington, He said that Mr. Latta, at one time general agent of the Pennsylvania Railroad, is the president of the combination controlling the interests of the independent telephone system in various cities, and that the people who were formerly interested in the street railways of Philadelphia, Messrs, El-kins and Widener, have taken hold of the project. Mr. Webb stated that the United Telephone & Telegraph Company, which owns the Pittsburg plant, as well as the Baltimore and Wilmington plants, will own the stock of the local plant. He said there was a separate organization in each town, and it was the intention to join the New York and Philadelphia lines and come from Wilmington and Baltimore, and from Washington to Pittsburg. He stated also that independent systems were being established in Cleveland, St. Louis and Chicago, and various other towns in the West, with all of which the main company would eventually combine and establish a complete long-distance service. The rates, he said, would be \$48 a year for a business telephone and \$36 for a residence telephone, these being the standard rates adopted in each city. The Commissioners have the matter under advisement, and their views on the subject will be embodied in the report which they will make on the bill to Congres

The independent telephone companies, says the N. Y. "Commercial." are poshing ahead in New Jersey, and negotiations are being conducted for the formation of new companies and the purchase of old concerns. A few days ago the Atlantic Coast Telephone Company was incorporated at Atlantic City, with a capital of \$100,000, under the laws of New Jersey, by Louis Knehmle, Charles C. Fortner, R. B. Hazlett and James B. Reilly. The existing company there charges subscribers from \$48 to \$80, while the new concern will charge from \$24 to \$36. Negotiations have also been concluded by which the Montclair & Bloomfield Telephone Company has been sold to the Telephone, Telegraph & Cable Company of America. A large sum of money will be spent in developing the service in the territory.

At the annual meeting on the 17th inst. of the stockholders of the People's Telephone Company of Biloxi, Miss., the following board of directors was elected for the ensuing year; John Walker, W. K. M. Dukate, H. E. Latimer, L. Lopez, Jr., D. A. Nash, J. C. Clower, R. J. Lowery, J. B. Chim and Byrd Enochs. The following officers were re-elected: John Walker, president; W. K. M. Dukate, vice-president; John Canaway, secretary and treasurer; E. L. Doyle, general manager. There was an annual dividend of 10 per cent, declared, payable to the stockholders January 20. This is a splendid showing for the company, and the constant demand for telephones indicates a decided commercial development in that town, which has accorded the company such a liberal patronage.

The Waynesboro Telephone & Telegraph Company are soon to erect a telephone exchange at Louisville, Ga. They are also building a line from Waynesboro which will connect with the Southern Bell Telephone Company, and will soon have first-class telephone communication with the outside world. They have already been granted a franchise by the city authorities, and their representative said recently that they expected to have it in operation in the next thirty days.

The second quarterly meeting of the Interstate Telephone Association was held at Joplin, Mo., on the 16th inst. The association embraces about 100 different towns in Southwest Missouri and Southeast Kansas, and embraces twenty-five independent telephone systems. The association adopted the standard construction system and established a basis for long distance toll charges, 25 cents being the charge for fifty miles, and 10 cents for each additional twenty-five miles. The association's plans will greatly benefit the service of the independent telephone companies of the Southwest. The next meeting of the association will be held at Fort Scott, Kan., on April 10.

The Independent Telephone Company has its line in working order from Montgomery, Minn., south. The Home Telephone Company, operating its line between Montgomery and LeSueur Center, the county seat of LeSueur county, has arranged to make connections at Montgomery with the In-

dependent Company so that direct communication can be had to LeSueur Center from any point reached by the latter company for the single charge of 25 cents.

The Ohio Valley Telephone Company has announced a decided advance in rates, to take place February 1, in New Albany. O. For several years on account of the sharp competition of the Home Telephone Company, a corporation controlled and owned by New Albany people, the rates have been reasonable: the price to private residences being but \$1 a month for the Ohio Valley Telephone Company and a slightly increased rate on the part of the other company. These low rates greatly increased the patronage and both companies now have in operation in New Albany about 1,200 telephones. The advance announced will probably cause a number of subscribers to the service to withdraw their patronage. Even at the low rates charged the enterprises must have been profitable, as the Home Telephone Company a few days ago declared a semi-annual dividend of 3 per cent. The earnings in New Albany of the opposition company have not been announced.

E. L. Grauel, representing the Northern New York Telephone & Telegraph Company was in Ogdensburg, N. Y., recently endeavoring to obtain a franchise to operate a system in that city. The Northern New York Telephone & Telegraph Company comprises a district of which Carthage, N. Y., is the southern boundary point and the St Lawrence river the northern. The line will extend east as far as Newton Falls and west to Watertown. The company already has an exchange in Carthage, another ready for operation in Watertown, and desire to place an exchange in Ogdensburg. The company will make competition with the new line put up in Franklin county and with a local line under course of construction between Utica and Carthage, thus giving connections with every town in that section of the State, as well as first classlong distance service.

The East Tennessee Telephone Company has just completed at a cost of several thousand dollars a new copper circuit between Dayton and Chattanooga, Tenn. It will be used exclusively for through work, and will greatly facilitate the handling of the rapidly growing business between those two points. It also completes a through metallic circuit from Dayton to Nashville, Cincinnati, Chicago and all points north and east.

An action has been commenced by the Stromberg-Carlson Telephone Company against the Mississippi Valley Telephone Company and J. C. Hubinger, to enforce the payment of \$8,003.25, alleged to be due on notes. It is claimed that two notes were given by the defendant, one for \$5,000 and one for \$3,000, the latter having gone to protest in November last. It is understood the paper was given as collateral in payment for switchboards and other apparatus.

A war has been inaugurated at Russellville. Ky., against the East Tennessee Telephone Company. The company notified their patrons that they had raised the rates 50 cents per month, and immediately every merchant, but four, in the city, and numerous private residences, ordered their phones out. It is said to be war to the knife, and the result will be watched with interest.

A new hundred-drop switchboard is to be placed in the local exchange of the Gainsboro (Tenn.) Telephone Company within the next thirty days. The old board would not accommodate the increased patronage of the exchange. An operator will be kept at the exchange all night. This company is rapidly increasing its nuleage, both by extensions and purchase of other lines.

P. D. Tebault, of the Maryland Telephone Company, at Hagerstown, Md., and S. L. Hoover, of the Winchester, Telephone Company, arranged recently at Sheperdstown, W. Va., to have the Maryland Company's franchise at Sheperdstown, together with its lines and materials, turned over to the Winchester Company. The latter company will extend its lines to Sheperdstown at once.

The Salt Lake City "News" says that a telephone line to the Deep Creek mining district, to be put up in the near future, is being contemplated by the Rocky Mountain Bell Telephone Company. This line is one of vital importance to those interested in the Deep Creek country and at last the telephone company has yielded to their importunings. The line, will be about 125 miles long and will project from Stockton into the very heart of the Deep Creek country.

Directors of the Eastern Shore Telephone Company met at the Hotel Avon in Easton, Md., on the 25th inst., and absorbed the Union Telephone Company of Talbot County and the telephone lines of Cecil County. This was the last step in the amalgamation of all the telephone lines on the peninsula of Delaware, Maryland and Virginia by the Diamond State Telephone Company. Men are at work connecting Seaford. Del., with Cambridge and Easton, Md., and by the middle of next week will have the entire peninsula system in working order.

The citizens of Jefferson City, Mo., are making an effort to secure cheaper telephone rates. They pay now \$2 for residences and \$3 for business houses per month to the Missouri & Kansas Telephone Company. They are trying to organize an independent company which will furnish telephones at \$1 per month to residences and \$2 for business houses. A committee has been appointed to confer with the Kansas City Mutual Telephone Company regarding putting in a system there at the above rates.

The Moultrie County (III.) Telephone Company has been reorganized with these officers: President, Silas D. Stocks, Sullivan: treasurer, L. D. Hostetler, Lovington; secretary, Marion Watson, Arthur; directors: George B. Spilter, Mount Zion, Macon County, and C. Lane. Sullivan. The line connects Mount Zion, Arthur. Sullivan and Lovington with the Macon County Telephone Company exchange and Decatur, III. The capital stock of the Moultrie County company is \$10,000.

The Telephone, Telegraph & Cable Company of America has filed an application for permission to construct subways through the streets of Yonkers, N. Y. The common council and mayor have approved the \$15,000 bond filed by the company to guarantee that work will be begun within a certain time after the permit is granted.

After a long and bitter fight the Colorado Telephone Company was given a franchise in Ouray, Col., over the Ouray Company, organized by J. F. Stodghill of Salida, the council standing 6 to 2. Rates will be the same as in cities of the third class having 125 telephones or less.

At the annual meeting of the Blue Earth Valley Telephone Company of Winnebago City, Minn., the following officers were elected for the ensuing year: W. Z. Haight, president; J. H. Sherin, vice-president: W. H. Hodgman, secretary and manager; David Secor, treasurer.

The Clarksville Telephone Company of Clarksville, N. Y., has elected the following directors: Cornelius Slingerland, M. W. Conger, L. S. Schell, J. M. Wright, C. L. Shea, A. Joslyn, M. T. Barber, J. W. Whitbeck, A. H. Crounse.

The Jefferson-Warren Telephone Company of Warren, O., has decided to increase its capital stock from \$40,000 to \$100,000. The lines of the company will be extended to Mercer, O., and other cities.

The independent long distance telephone line is being completed to Abilene, Kan. The new system at that place will then have a connection with Salina and also with all the towns in southeast Dickinson county, Kan.

Work on the new exchange of the Michigan Telephone Company at Niles, Mich., has been begun.

#### TELEPHONE INCORPORATIONS.

The Hawkeye Telephone Company, Iowa Falls, Iowa- to operate a system in I wa Falls. Capital stock, \$40,000.

The Kansas Telephone Company, Fort Scott, Kan. Capital stock, \$200,000. Directors: Grant Hornaday, W. P. Patterson and C. E. Cory.

The Tipton Telephone Company Tipton, Mo. Capital stock, \$1,400. Incorporators: J. M. Boyd, J. W. Marsh, P. J. Weber and others.

The Automatic Interconnecting Telephone Company, San Francisco, Cal.—to deal in telephones and to operate a system. Capital stock, \$100,000. Incorporators: A. K. Andriano, W. T. Hess, J. Finck, F. D. Bates, L. Harris, all of San Francisco

The Excelsior Telephone, Telegraph & Subways Company (incorporated at Trenton, N. J.)—to do a general telephone and telegraph business and to erect poles and wires and construct underground conduits in New York City and elsewhere. Capital stock. \$5,000,000. Incorporators: Richard White, New York; John Scott and C. N. King, Jersey City.

The Emergency Telephone Call Company of America, Albany, N. Y.—to operate a system of telephone and messenger calls, to publish a directory of subscribers and establish necessary agencies. The company will begin operation in New York City, but will hereafter extend its business to other cities throughout the United States. Capital stock, \$50,000. Directors: Albert Randolph, William A. Butler and Frank A. Peteler, of New York City.

### ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of source The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

\*Unlisted. † Ex div.

a The United Railways & Electric Company comprises in its organization the Baltimore Consol dated Railway & Company, the Baltimore City Passenger Railway Company, all the lines of street railway operated by the secompanies, and also the Central Railway Co of Baltimore. The pref stock of UR & Ecc Co has been issued in the form of mome bonds, because to Beston E evated Railway Company.

a Cowned by Brooklyn Rapid Transit Company.

a Leased to Beston E evated Railway Company.

a Leased to Beston E evated Railway Company.

a Leased to Beston Heights Railroad Co., which guarantees 10% on capital stock.

a Stock owned by Kings County Traction Company; road persued by Brooklyn Rapid Transit Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave RR and leased to Nassau system.

h \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.;

c Touris by lesse Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Company.

f St. per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company.

k Majority of stock owned by Chicago West Division Railway Company; 505,000 of stock owned by West Chicago Street Railroad Company.

k Majority of stock owned by Chicago West Division Railway Company; 500 of \$1,000,000 stock guaranted by West Chicago Street Railroad Company.

Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assuming its bonds

\*Unlisted. † Full paid. | Outstanding. † Ex-div.
a Leased to New Orleans Traction Company as 6 % on stock.
b Leased to New Orleans Traction Company as 8 % on stock.
b Leased to New Orleans Traction Company as 8 % on stock.
c Leased to Central Crosstown Railroad at 8 % on stock and interest on bonds.
d Operating the former Met. Trac. system, that corporation having become extinct.
e Leased to 23d Street Ry for 99 years; lease assigned to Met-opolitan Street Ry.
f Leased to Houston, West Street & Payonia Ferry—now Metropolitan Street Ry.
f Leased to Metropolitan Street Ry. at 8 % on stock until Oct 1. 1897; thereaft r 9 %.
h Leased to Metropolitan Street Ry. for 99 years from Jani 1, 1895, at \$215,000 per annum.
i Leased to Metropolitan Street Railway for 18 % on etc. k
j Leased to Metropolitan Street Railway for 18 % on capital stock.
m Controlled by Third Avenue Railroad by nurchase.
n Dividends of 1% % yearly guaranteed by Consolidated Traction Company,
o Controls by lease the Alleg'ny, Cent., Ottz-ns' Duquesne. Fort Pitt & Pita'n Traction,
p Leased to Consolidated Traction Company for 8 % on apital stock.

Eleased to Consolidated Traction Company for 8 % on apital stock.

### NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 15%@16c.; Lake, 16@16½c.; casting, 15½@15%c.

The Northern Ohio Traction Company has declared its first semi-annual dividend of 2½ per cent. on its preferred stock, payable February 1.

The New England Telephone and Telegraph Company has declared the regular quarterly dividend of \$1.50, payable February 15.

It is understood that some changes are to be made in the directorate of the Pennsylvania Electric Vehicle Company at the annual meeting of stockholders, Febru-

A receiver has been appointed for the Ballston (N. Y.) Terminal Railroad, a twelve mile county trolley, owned by Philadelphia capital and bonded for \$250,-

The Brooklyn Rapid Transit Company's annual meeting was a harmonious affair. The new directors elected were August Belmont, H. H. Porter, N. G. Oakman, A. R. Flower and F. P. Alcott.

The Metropolitan Struct Railway Company of Kansas City, Mo., has increased-its dividends from 4 per cent. a year to 5 per cent. Dividends are paid to stockholders quarterly.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Blat, 18½ 420; New York Electric Vehicle Transportation, 9(494; New England Transportation, 6(46).

On February 15, the quarterly rental of 113 per cent, will be due and payable on the slock of the West Chicago S reet Railway. The transfer books will close February 5 and reopen February 16.

A mortgage for \$1,000,000, to run twenty years, at 5 per cent. was filed for record last week at Toledo,  $\Theta$ . It is given by the United States Telephone Company to the Cleveland Trust Company.

It is announced that the reorganization committee of the Chicago Electric Traction Company has notified its counsel, Lovy Mayer that the \$500,000 of first mortgage 5 per cent bonds are ready for distribution.

The volume of business transacted on the New York Stock Exchange aggregated 1,314.879 shares—the smallest total recorded for over a year. This time a year ago the sales exceeded a million shares a day.

The Massena (N. Y.) Electric Street Railway Company has called a meeting of the stockholders for the purpose of increasing the capital stock from \$100,000 to \$125,000. It is understood that the road is to be built this year.

The recent strength of Brooklyn Rapid Transit stock is attributable in a large measure to the association of H. H. Porter's name with the management. It is expected Mr. Porter will be chairman of the executive committee.

The mayor of Worcester, Mass., says that "if the Worcester Traction Co. persists in its purpose of declaring a dividend on its \$3,000.000 of common stock—all water—it will have to deal with the city of Worcester as a corporate body."

Both houses of the New York Legislature have passed the rapid transit bill, authorizing New York City to 1841 \$35,000,000 in binds for the underground railway. Contractor McDonald says he will be backed by a company of well-known finan-

The Illinois Electric Vehicle Transportation Company announces "that the payment of the second installment of \$5 a share, due on February 1, is further expayments of the second instantment of \$1 a share, due on reordery 1, is further ex-tended to July 2. without interest, as the company has adequate funds to meet pres-ent requirements."

The Bridgeport (N. J.) Traction Co., reports as the net earnings for the month of December \$13,348, an increase of \$5.585 over the corresponding month in 1898. For the six months ending with December the net earnings were \$92,364, which exceeds the similar period in 1898 by \$8,144.

exceeds the similar period in 1898 by \$8,144.

It is reported that the Massachusetts Electric Companies are making a very handsome showing in net earnings. This is largely the result of combined operation and management, but partly the result of the freedom from snowstoims this winter, always an expensive item with suburban roads.

The United Traction Company of Albany, N. Y., has decided to increase its capital stock from \$4,000,000 to \$5,000,000. The funds thus obtained will be used to pay off the debenture bonds of the Troy City Railway, amounting to \$399,700; the floating debt of the Troy City Railway, amounting to about \$200,000, and that of the Albany Railway, amounting to about \$100,000. The remaining \$300,000 will be used for improvements to the Troy Division.

The news comes from Detroit that the Eric Telephone Company will not see

The news comes from Detroit that the Eric Telephone Company will not get possession of its latest acquisition, the Detroit Telephone Company, for which it paid about \$1.250,000, without a legal struggle. Two of the largest interests among the minority stockholders of the Detroit Company are said to be Henry A Everett of Cleveland and the estate of the late Albert Tack.

A circular has been issued announcing a merger of the Electric Axle Light & Power Company with the Consolidated Railway Electric Lighting & Equipment Company. Issae L. Rice is President of the latter and chairman of the board of directors of the former company. Electric Axle is to receive 67 per cent. in stock of the Consolidated Company Deposits of stock are to be made by February 3.

Kuhn, Lieb & Co', New York bankers, have distributed a circular letter to their friends inviting them to become members of a syndicate to finance the Third Avenue Railroad Company of this city. The amount of the syndicate and particulars are not stated and the formation of the syndicate itself is subject to an expert examination of the property, which will not be completed until the end of this week. week.

The properties of the Cincinnati & Hamilton, the Miami Valley Traction and Dayton Traction companies have been consolidated. The new road will be known as the Suthern Ohio Traction Company, with an authorized capital of \$2,000,000 and an authorized bond issue to the same amount. The combined lines of ver a distance of 52 miles. The capital interested is mostly that of Cleveland, Akron and Hamilton. and Hamilton.

The minority bondholders of the Lake Street Elevated Railroad of Chicago are preparing to apply for the appointment of a receiver for that property. Their action is sustained by the recent decision of Judge Jenkins in the United States Circuit Court of Appeals. That decision was made in the case of William Ziegler and others against the Lake Street road and was in favor of Mr. Ziegler and the other minority bendholders.

Samuel D Dekenson of New York has applied for an injunction restraining the Consolidated Traction Company, of New Jersey from paying a dividend on the company's stock. It is the second annual installment of \$150,000 paid by the North Jersey Company under the lease and the Whitney sydicate is largely interested in both corporations. A suit is pending to have set aside as fraudulent the lease by which the Consolidated turned over its lines. Until this latter is decided the countrefuse to interfere in injunction proceedings. court refuses to interfere in injunction proceedings.

#### EDITORIAL NOTES.

The Ouestion of Sheathing on-Men-of-War.

In the issue of ELEC-TRICITY of February 15, 1899, there appeared an article entitled " Electroplating of Ves-

sels' Hulls," in which a method of applying a copper coating directly to an iron or steel hull by means of a flexible and movable path, was described. This process was given a practical trial on an ocean going tug, with the result that after being in the water for several years a careful examination of the vessel's bottom failed to reveal any signs of electrolytic action. Mr. A. A. Knudson, the well known electrolytic expert, who made the examination, after referring to the fact that no trace of galvanic action could be found, said:

"One feature of this method of plating has greatly impressed itself upon my mind during the examination of this boat. I refer to the excellent condition of the surface of the copper plating. I am told by those who have been connected with this boat since she was plated four years ago that her bottom has not been cleaned during that time. With the exception of two places, on and near iron patches, where barnacles to a small extent have collected, the entire balance of the bottom is free and clean from any sea growth of barnacles or anything else pertaining to the sea."

In view of the excellent results obtained by the above mentioned process, the majority and minority reports of the Board of Construction on the question of sheathing recently transmitted to Congress by Secretary Long are extremely interesting. The majority of the Board, consisting of Rear Admirals O'Neill, Melville and Bradford and Commander Richardson Clover, strongly recommends that the law requiring sheathing for battleships and armored cruisers be repealed.

The report of the majority is supported by a letter from Rear Admiral Sampson, commandant of the Boston Navy Yard, in which he says that on the training ship Chesapeake, water has penetrated between the sheathing and the steel, resulting in the steel being pitted. Now with the electrolytic process already referred to this would be impossible as the copper is not separated from the steel of the hull, but on the contrary forms an integral part of it. As is well known, in order to have galvanic action it is necessary that the steel and copper

should be acted upon simultaneously by a suitable electrolyte such as sea or salt water. With the method of sheathing now generally in vogue such action as this is possible, but where the copper is deposited directly on the steel the sea water comes in contact with the copper only and can in no way penetrate through it to the hull proper.

In view of the excellent results that have been obtained by the electrolytic process of plating vessels' hulls, and in the fact that this process is said to cost but about \$3 per square foot against \$5 per square foot for the old method of sheathing, it might be well for the Navy Department to have one or two of the ships now in course of construction plated in this way. In this connection it is interesting to note that Naval Constructer Gilmore has been instructed to make a report upon the methods of sheathing pursued in Europe.

\* \*

Too Much Johnson.

In a recent lecture before the Manhattan Single Tax League of New York City the Hon. Tom L.

Johnson, who is alway brimful of queer ideaswhen he is not at the front in managing a street railroad—tried to impress upon his audience the fact that the only real way to solve the railroad problem was for the city to own the street railways and give free transportation to the public. As Mr. Johnson is well known in the traction world as a millionaire who acquired his wealth promoting railway schemes, we feel confident that the many friends of ELECTRICITY will enjoy reading the Honorable Tom's latest effusion for the amelioration of social conditions—which was as follows:

"There is but one way to solve the street railroad question, but one way to operate street railroads that they shall give the best results to the public, and that is that they shall be owned and operated by the municipalities. It would be better still if street railroads were not only owned and operated by municipalities, but were at the same time free.

"In our great office buildings the office service is free. The high buildings could not be rented unless they had elevators. And yet I suspect that in the rent bill of every tenant in one of these buildings there is a certain additional charge for elevator service. So if you had free street railroads the value of lands along the roads would be increased. An increase of the taxes upon these lands would follow, and the increase in the value of these lands would many times compensate for the extra outlay in taxes that would be necessary to pay for free street car service.

"Suppose the street railroads were free. There would never be a strike. Some say street railroads operated by the municipality would-interfere in politics. I ask you if they do not interfere in politics now. The reason for this is that you have put into private hands a public function. Only those institutions should be municipalized which are natural monopolies and which depend for their existence upon special privileges at the hands of the city government. Such institutions as the fire department, sewers, parks, waterworks and a few others should always be in the hands of the city. When you begin to dispose of them to private owners you open an avenue for corruption in politics which will inevitably be taken advantage of.

"To those who say the city can't operate street railroads I want to call vour attention to the best managed street railroad that was ever run in this country. That was the railroad on the Brooklyn Bridge. You can always trust much better for the management of such things as these your own agents, whom you can get rid of at your will, than corporations which have a franchise of 999 years to operate the road as they please.

"You ask me how the city could secureroads having such a long franchise. I tell you that there is more bad law in the Dartmouth College case than in any other decision in the law books. But under the present laws, I would suggest that all the value there is in a franchise be taxed out of it by the State Legislature, and then the actual property that is left be purchased at a fair price. Although the Legislature of New York has granted certain street railroad franchises for 999 years, it has not cut itself off from the power of decreasing the fare which the railroads can charge. If the Legislature so decided, it could prohibit the collection of more than one, two or three cents for a ride on a street car. This would soon take all the value out of the franchise.

"Reduced to a fundamental proposition, I do not believe any grant for 999 years is valid against the people. We who respect property rights in those things men have created say that property is so sacred that you shall not use it even to pay a tax. But when we come to other property rights we should no more respect the rights to public highways than we respected the right of the Southern slaveholder to the life of negro slaves."

The Chevalier de Rochas, in one of his scientific studies, said that the "only way a man can become a juggler is by dint of common practice," and after reading the above extracts we are led to believe that the Hon. Tom Johnson is a juggler "for fair"—at least, a juggler of words.

According to Mr. Johnson, he would grant a company a franchise and then "have all the value there is in the franchise taxed out." We hardly think that Mr. Johnson's theory of ethics will be approved of by any right-thinking person—in fact it is an argument that the followers of Karl Marx, the learned socialist, would hardly care to advocate.

Mr. Johnson, when connected with the Nassau Railroad in Brooklyn, quickly realized that the city authorities of greater New York were glad to "rent" the railroad on the Brooklyn Bridge to the traction companies—after it was discovered that the Bridge railroad didn't

pay as a "municipal undertaking," and, if we are not mistaken, Mr. Johnson learned to his sorrow that Gov. Pingree's "three-cent-rail-roads" in Detroit were all up in the air.

To obtain possession of street railways in the way that Mr. Johnson advocates would be a violation of the fundamental law of justice, and we are forced to the belief that all the preaching the Hon. Tom L. Johnson may do as a "millionaire single-tax politician" will not take away a single franchise from the gentlemen he associated with when he was a "common railroad man."

Ether Waves to Guide Torpedoes. From time to time we have referred in these columns to various electrical inventions and devices that have been

brought out for controlling torpedoes. One of these consisted in placing inside the torpedo a number of electro-magnets which were made to operate the steering gear when acted upon by a current of electricity, transmitted either from the shore or a nearby ship through a cable which was unwound as the torpedo forged ahead. This arrangement, as we stated at the time, embodied several objectionable features, which, to the best of our knowledge, have prevented it being adopted. To do away with the reel of wire, efforts were made to adapt Hertzian waves to the controlling of torpedoes, with the result that at the present time no less than half a dozen systems have been brought out, all more or less resembling one another and differing only in the detail of the apparatus made use of. Even Nikola Tesla investigated the subject, and if we are not mistaken exhibited a model of his apparatus at a dinner given in his honor a short time ago in Chicago. About a year ago two Swedish inventors exhibited before the King of Sweden an electric appliance for the steering of torpedoes actuated, so it was claimed, by means of X-rays. The patent rights were presented as a gift to that country, all the details of the mechanism being kept

In England experiments in ether wave steering have been conducted from time to time at Weymouth, while still more recently Lieutenant Commander J. C. Colwell. United States Naval attaché, in London, witnessed a series of experiments in this line at Yoevil. The inventor of this system for steering torpedoes is Cecil Varicas, an Englishman. The tests recently made were on a comparatively small scale, but were said to have been extremely satisfactory, the model being controlled by a current sent from the shore with no intermediate wiring. Although the exact working of this system has as yet not fully been made public, it is understood the Hertzian waves are made to operate either one of two solenoids, which moves the steering gear either to port or starboard as desired. After the test Lieutenant Commander Colwell is reported as saying:

"I believe the experiments have fully proved the practicability of the theory, but a decisive opinion cannot be risked until the invention has actually been applied to full sized craft and submitted to aqueous atmospheric conditions. If, after that, the principle evinced in miniature should hold good, then it may be said that the day of the present torpedo has passed, and that the present methods of harbor defence are revolutionized."

Lieutenant Commander Colwell will submit

at an early date an exhaustive report on this subject to the Navy Department, which if made public should prove very interesting and throw considerable light on this method of steering torpedoes.

In the Marconi system of wireless telegraphy no means has as yet been devised for preventing interference, and in the case of applying these same waves to the guiding of a torpedo the question arises as to whether a ship provided with induction coils and other necessary apparatus could not nullify the waves sent from another ship or from the shore and thus cause a torpedo to run at random. This would seem another interesting problem that presents itself at the beginning of speculative thinking on this subject.

### UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

Consul McGinley writes from Athens that a company has recently been formed in Athens, known as the Greek Electircal Company, with a capital of \$600,000. The founders are the Bank of Athens and the Societe Generale d'Enterprise. The object is to undertake the electric lighting of Athens, Piraeus, Patras. Syra and Kalamata.

The Northern Pacific announces that with the inaguration of its new double service to Seattle. Wash., in March it will do away with gas as an illuminant and introduce a new system of electric lighting which has not heretofore been attempted on Western roads. Each car, according to the plan, will be independently supplied with lighting power from motors on the car axles. The trains will be hauled by new express engines capable of making as a maximum speed, eighty-five miles an hour with a heavy train.

AT a fire at the corner of Mott and Hester streets, New York, Saturday night the electric searchlights used by the fire department had a good trial. First the square light was used. This lighted up the whole front of the building, and was a material aid to the firemen who were dragging the hose up the fire escape. The lens light was also used and an attempt was made to throw the beams into the basement .-It was not a success and the light was taken from the engine and set on the sidewalk near the building. A coil of wire was then connected with it and the light was thrown into the smoky room. The light did not penetrate the smoke. "There never was a light invented that will penetrate smoke, but the illumination of the smoke will be of great help to the firemen," said Chief Croker.

A PENNSYLVANIAN has patented an electrical switch operating mechanism, which has two pairs of magnets suspended on a bar, to be lowered on either side of the switch and draw the bar in either direction as the current is switched into the magnets by the motorman.

News comes from Tacoma, Wash., of an electrician who has installed in the City Hall of that city an invention of his own, in the way of an incandescent lamp which runs on a trolley arrangement and is a great aid to the registration clerk in his work. From an ordinary rosette, placed high enough on the wall to be out of reach, two bare wires extend a few

inches apart to a hook on the opposite wall, just over the registry counter. A little bar, with hooked metallic connections, from which is suspended an ordinary electric globe, runs along the wires and can be moved backward and forward at will.

THE Berlin correspondent of the London "Times" reports that the German Telegraphs Administration some time ago placed proposals before the British Post Office for laying a new cable between Emden and the English coast. The assent of the British authorities to these proposals has not yet been obtained.

In a paper recently read by Mr. Mariani before the Institute of the University of Rome, Italy, the question of the magnetic disturbances caused by electric street railways was taken up. The author in his conclusions stated that the magnetic materials on a street railway directly affected the compass up to a distance of 150 yards from the line. The further disturbances such as are felt by magnetic observatories, are due to the leakage currents from the earth return, and the range over which these are felt is stated to be some 2,000 yards.

The State Board of Electricity of Minnesota has made the first report to the Governor, from its beginning July 18 to January 6. It has registered 514 electricians by virtue of their standing in the trade when the law began, and 23 by examination. It has given master's certificates to 30, journeymen's to 219 and specials to 288, these last men were working at the trade but probably unable to pass examination. It has held 45 meetings, and received 549 applications.

THE New York "Herald" says that Prof. William A. Eddy, the kite expert, of Bayonne, N. J., is now engaged in seeking a means to harness electricity into a cheaper and better system than that of the dynamo. Three tailless kites, 2,000 feet of threadlike copper wire. an iron rod and a simple switch comprise the harness. Prof. Eddy has progressed far enough to utilize the intense intermittent current for photographic and laboratory purposes. He says the system may become a powerful factor in army signaling and that the future promises to disclose a means of lighting great sky scrapers with electric fluid from the clouds. Prof. Eddy first raises three kites early in the evening. When the kites attain an altitude of from 500 to 700 feet he attaches a collector to the cable, which is made of strong flax. The collector is a light wooden frame about two feet square. It is covered with mosquito netting on which is pasted a large sheet of tinfoil. The netting is used because the tinfoil is too frail of itself, and will not stand the blast of the winds. The air strikes this "collector" on both sides at once. To this collector is fastened a threadlike copper wire. Then the kite cable is paid out until the kites attain an altitude of 2,000 or 2,200 ft. The collector is 610 ft. below the kites, and as it raises above the ground it gathers electricity. The collecting process increases with the altitude. An iron rod driven into the ground near the cable reel serves as a ground for the current. The copper wire, as it leaves the wheel, passes tightly around the rod and then on up the cable. The current is thus rendered harmless. Prof. Eddy said the high buildings in New York could be lighted by electricity gathered from the clouds by means of gigantic collectors, and that the great

problem now is how to insulate the roofs of these structures in order to prevent the current from escaping through the iron frame work into the ground. Millions of volts could be secured from the clouds, he asserted, when this problem is once solved.

The commissioners of Victoria Park, Niagara Falls, Ontario, have granted to a syndicate represented by General George S. Field, of Buffalo, a concession to build a power canal on the Canadian side of the falls, from which it is expected that about 200,000 horse power will be developed. General Field is the representative in this country of the Exploration Company, Limited, of London. The Field syndicate proposes to divert water from the Welland River, to a point on the bluffs overlooking Niagara Falls Park, 'The fall here obtained will permit a development of from 30,000 to 60,000 horse power. By means of an open canal, the stream will then be carried to a point on the precipice overlooking the Niagara, and immediately north of the falls. The second discharge will permit of a further development of 125,000 horse power. The exact terms of the rental to be paid by the syndicate will not be divulged at present, but it is stated that they will virtually be the same as those arranged with the Canadian Niagara Falls Power Company. The latter company has to pay a fixed rental of \$15,000 per annum for development up to 10,000 horse power. For the second 10,000 horse power development the rental is \$1 per horse power; for the third 10,000 horse power, 75 cents per horse power, and for all further development, 50 cents per horse power.

LORD RAYLEIGH, in a recent lecture on "Flight" at the Royal Institution, London, among other things said: "I am disposed to agree with Mr. Maxim (who was among his auditors) that a real flying machine, capable of supporting itself for a considerable length of time, and of being steered in a desired direction, is only a question of time and money." He added, however, that the question of alighting still seemed to him to present very great difficulties, not only because of the impetus of the flying machine, but because of the presence of perplexing and contrary currents of air which would always be met with as the machine neared the ground.

In view of the recent adverse report by a Board of Naval experts on the submarine boat Holland the following paragraph from a London correspondent of a Glasgow paper is significant to say the least: "I have a letter from a French correspondent giving quite rosy pictures of the trials of the new Goubet submarine boat. On the surface it is easily manoeuvered. It was found habitable when 15 feet under the surface for five hours, during which, however, it was stationary. As yet it has not steamed for any length under the surface, although plunges downwards have been made with comparatively slow returns to the surface. On surface level the speed is 6 knots, but when it has done this in unknown waters, at a distance under the surface to ensure no surface motion whereby its locality might be detected, the feasibility of submarine propulsion may be within distance of solution, but not until then. The Narval class, of which six boats have been built, has proved thus far unmanageable; and in view of this and the inconclusive tests of the Goubet, navy experts in France, I hear, are growing doubtful

and morose over the prospects of ultimate success. This, however, will not surprise trained naval architects in this country or in Germany."

The new electric railway to be built on the Peninsula of Yucatan promises to be the longest of its class in the world. It will traverse Yucatan through Chiapas, Tabasco and Campeche, a distance of 403.2 miles, and will cost \$15,000,000.

#### A CARD FROM DR. PUPIN.

Editor Electricity.

Six: Permit me to propose through the columns of your esteemed journal Mr. Charles S. Bradley as candidate for the presidency of the American Institute of Electrical Engineers. I have to support my proposition by a brief review of Mr. Bradley's engineering record. I am aware that I run the risk of offending the code of good form; for sincere appreciation of a man's good work may be looked upon as honest enthusiasm or mere hollow gush, depending on circumstances. It is extremely difficult to speak enthusiastically of the work of a living man and avoid the appearance of being a flatterer. I am prepared to pay the penalty of this appearance.

Mr. Bradley was always connected with big things in electrical engineering. He was the engineer of the Edison Illuminating Company in 1881. Electric lighting was then a huge experiment. It proved a huge success, thanks in a great measure to Mr. Bradley's inventive resources.

The Edison Illuminating Company was then too small for two men like Edison and Bradley. Mr. Bradley transferred his activity to a very modest little laboratory of his own in one of the most secluded little alleys in Yonkers. This laboratory was the birthplace of some of the foremost electrical inventions in electrical engineering. I shall mention a few of them only.

The Electrical Reduction of Aluminum.—A patent on this invention was granted to Mr. Bradley in 1891. The process employed by the Pittsburg Reduction Company at Niagara and by many European companies is based on this patent.

The Method of Multipolar Winding, now so generally employed in the construction of continuous current machinery, was first worked out by Mr. Bradley. He constructed the first multipolar machine in this country in 1887. It was tested by Prof Geyer, of Stevens Institute, and by the Edison Electrical Works at Schenectady, where it created a profound sensation.

The Generation and the Method of Combining Polyphase Electromotive Forces was first developed by Mr. Bradley in 1887. The famous transmission experiment at Frankfurt in 1891 brought Mr. Bradley's name in strong prominence, alongside of the names of Ferraris, Tesla, Wenstrom and Dobrowolsky. Ever since that time he has been known in Europe even better than in his own country.

The first Rotary Converter was built by Mr. Bradley in 1888 and secured for him a broad patent on this invention, which may be regarded as the very backbone of electrical transmission of power.

It is not necessary to go any further into the long list of Mr. Bradley's epoch-making inventions. I have said enough to prove the appropriateness of my proposition.

Most respectfully yours,

M. I. Pupin.

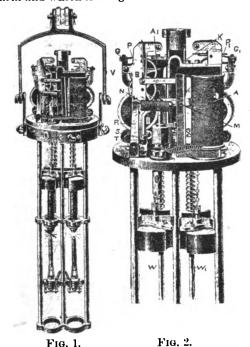

#### TWIN-CARBON ARC LAMPS.

Several of our German contemporaries, says the "Electrical Engineer," London, describe a type of twin-carbon arc lamp, recently introduced by Messrs. Korting and Mathiesen, which has already found some favor on the German market. As Mr. W. Mathiesen, the writer of the description, remarks, many endeavors have been made by inventors to produce a satisfactory arc lamp having two arcs in series. The advantages offered by such a lamp would be, of course, that it might be connected singly across a 110-volt circuit.

A few years back there appeared on the market an enclosed type of arc lamp which so far met this requirement in that it took about double the normal pressure sufficing for an open arc—that is to say, about 80 volts, and could, therefore, be connected to a 110-volt circuit—the lamp, however, failed to completely solve the problem pertaining to high-potential arc lamps, since the well-known hissing of the enclosed light does not permit of the long-burning arc being always employed, besides which the low efficiency of the arc constitutes a further obstacle to its use. These disadvantages can only in a comparatively few cases be neglected

The lamp introduced by the above-mentioned firm and which is designed to overcome these

difficulties, is shown in Figs. 1 and 2. It may be described as a combination of two independent regulating devices which are attached to a common base-plate. The regulating mechanism belongs to the well-known type in which a magnet provided with a hinged armature actuates the regulating clockwork. The arrangement is apparent from the accompanying sketches, which clearly show almost every detail. This regulating mechanism consists of the shunt-wound magnet, a, and the clockwork, b, which latter is connected with the magneto armature, m, by the tongue; o. The necessary opposing force to the magnet is afforded by the spiral spring, n. The corresponding parts of the second regulating apparatus, so far as they are visible in the sketch, are denoted by similar letters, with the addition of the number 1 • -- for instance,  $a_1$ ,  $b_1$ , and so on. The escape wheel, p, of the clockwork, b, is governed by a catch attached to the tongue, G, which in turn is carried by the two-armed lever, r, and this,

together with the second tongue,  $G_1$ , is subjected to the common influence of the heat compensator, K, which according to the temperature attained by the lamp mechanism with constant regulating tension, compensates the backward movement of the pivoted armature, m, by pushing back the lever arm, thereby maintaining the regulating tension of the spring approximately constant.

The variation in weight of the carbon-rods is rendered a negligible quantity by the method used of pivoting the clockwork, so that the regulating tension is not influenced thereby. In order to prevent the jerky movement of the clockwork, air pistons or dash-pots, T, are provided. The potential to the arcs may be regulated by adjusting the screw, s, whereby the pull of the spiral spring, n, is controlled. The advantage which this type of lamp offers is that it may be connected singly across a 110volt circuit, as mentioned above, or in pairs across a 220-volt circuit. This advantage is very apparent where the latter pressure is in question, since it is not every consumer who can employ four to six of the ordinary type of lamp. The twin arc type of lamp, like the Nernst lamp, therefore facilitates the general endeavor to increase the pressure of the current supplied to the consumer. It certainly offers a disadvantage with regard to working cost, which is greater in the case of twin-arc lamps than with single arcs, since instead of one pair of carbons it requires two, which though of somewhat less diameter, cost more for the two pairs. Further, the intensity of light given by the two arcs is not so great as that of one arc consuming an equal amount of energy, for the efficiency of arc lamps increases under normal conditions with the current strength. The enclosed arc type of lamp, compared with the twin-arc type as regards intensity of light, is still considerably its superior. But even if the working costs of the twin-arc lamp are higher than those of the single-arc lamp, argues the writer, the advantage offered by the first type is still so great as to make it of considerable importance in connection with central stations supplying at 220 volts.

#### The Railroad Refrigerator Test in Louisiana.

An interesting test was lately made of railroad car refrigeration by electricity. A run of 118 miles was made over the Louisville and Nashville Railroad, from New Orleans to Pass Christian and back. The refrigerator car was attached to the special Pullman car Olivette, which had on board a party of electrical experts and newspaper men from New York. The refrigerator test was the most satisfactory that has yet been made by the Electric Axle Light and Power Company, which controls the patents for generating electricity from the axles of railroad cars. Just before the start the test thermometers in the interior of the refrigerator car registered 53 degrees Fahrenheit. The car was not opened until the special returned to New Orleans when the thermometer showed a temperature of 40 degrees Fahrenheit. The test was an exceptionally severe one, as the car was practically empty, causing it to sway and run more unevenly than would have been the case had it been loaded. The con-stant swaying and jolting tested to the utmost the electrical mechanism which operates the pumps that force the ammonia through the piping under the roof of the car. The working of the system was regarded as of extreme importance by railroad men, as it means doing away with ice for the cooling of cars that carry all kinds of perishable products from interior points to the principal markets of the country.

### CENTRAL STATION ECONOMIES.\*

BY H. W. FRUND.

It is not the purpose of this paper to dwell minutely upon all the economies that can be practiced in central station work, as they are so many and diversified, according to local conditions which surround each individual plant, that to intelligently handle so profound a subject a vast amount of time and space would be needed, making it almost impracticable and at least a gigantic undertaking, as every one will know who has studied the subject.

It is to the smaller stations that I wish more particularly to direct my paper-stations in cities having less than 30,000 population. In fact, I can conservatively say that out of more than 2,500 central electric stations in the United States 90 per cent. are located in cities of 30,000 or less population. This class of stations is now particularly suffering from socialistic and anarchistic tendencies, and from promoters who have not a dollar invested, who work up municipal ideas in the fertile minds of astute aldermen, who have, strange to say, often more power than the Czar of Russia, and ring in a municipal plant and thereby confiscate bona-fide investments made by and through invitation of the same municipal authorities a few years before.

Stringent economies must be practiced, particularly in cases where a company is forced to compete with all the taxpayers, for such is the case when money is required. To carry on municipal works, a tax levy is made and all contribute through the tax office. Whether or not the tax-payer uses light, he must pay his part to carry on the undertaking, and that, too, whether or not the plant is self-sustaining.

One of the avenues of expense in a central station is the cost of maintenance of meters, caused to a large extent by dust, bugs, spiders, corrosion, etc. We have all learned to our sorrow what damage bugs and spiders seeking warmth in a meter can do. They find it a convenient place to build their nests and hatch their eggs, spin their tiny webs and stop our dollars.

Have you meters of this type of any make? If you have they are unreliable, and an unreliable meter is a dead expense, and you need to stop this expense at once. Before I proceed further I wish to qualify the word unreliable. We all know that an electric meter is nothing more than a motor and is never in the company's favor. The customer has all the gain derived from slowing-up meters caused by dust, broken jewels, etc., and there is nothing in central station work which creates more discord and tests the confidence of your consumers than to have a lot of meters slowing-up and finally stopping. Often meters cease to register altogether during the middle of the month, and while there are several ways of averaging and adjusting bills, yet nevertheless the customer is always suspicious of his meter, particularly after paying two or three months' bills taken from a slow-moving meter and then is called upon to settle upon a newly adjusted meter-reading. You hear, no doubt, as I have frequently, from good, sensible people, that they have no confidence in any meter, be it water, gas or electric. I had an occasion lately to inquire from a person who could not procure electric power service from a lighting company, why he adopted a gasoline motor when

<sup>\*</sup> Paper read at the eighth annual meeting of the Northwestern Electrical Association, Milwaukee, Wis., Jan. 18, 1900.

he could procure a high-grade coal gas for motor service at \$1 per thousand cubic feet. His answer was that he had no confidence in a gas meter and went on to state that for months previous he had been using gas for brazing. work. Wanting to know one day how much gas a particular job of brazing required he noticed the index of his meter. After the work had been completed he again read the meter, and was no wiser, as it had not changed from last reading. He then examined his gas bills and found that for several months previous the bills were nearly of the same amount. He immediately reported the matter to the gas superintendent who caused the meter to be replaced with a new one. Then the trouble began, his bills being quadrupled. I called his attention to the fact that it was charitable to concede that the gas company wanted customers and would wish to retain them by treating them fairly, and that if their rates were satisfactory, certainly their new meter placed would only register the true amount consumed, and that the register of the slow meter which finally stopped and was removed, should not be held against the company, particularly as he could ascertain from time to time a true reading of a meter himself. His answer was that any company that was so careless as to have such an appliance in use would be just as apt to put in a meter that would register too fast, and insist upon the same being correct, and that therefore meters were in his opinion unreliable.

This is but one of the many arguments of consumers; therefore you cannot afford to have a class of meters which require from four to tive inspections per annum if you desire to have and keep the confidence of your customers. It is a useless expenditure. Until lately meters of all makes have been full of imperfections, bringing woe and trouble to the central station men. Suffice it to say that the present time meters, and when I say meters I refer to watt-hour recording meters, are to be had that will fulfill requirements much needed in the past, and that are not only bug, moisture and dust proof, but will also register power which we sell in many forms with accuracy throughout the entire range of load.

With this class of meters, and proper handling and installing, the periodical inspection and expense is not required, and if you have any old type meters that are not dust or moisture proof it will pay to change them as soon as practicable and the savings thereby will be at once noticeable. There are quite a number of good ampere-meters in service in central stations to-day that can be made impervious to disturbing elements by the use of putty in sealing the cases and terminal posts, and if meters are not too greatly overloaded, with no ventilation, will work fairly well.

The company I am engaged with placed in service in 1895 about 150 ampere meters and our expense was more than \$20 the first year for jewels on account of dust and dirt. This was not the only expense as we also had a loss on account of meters not registering accurately.

I caused all meters to be brought into the station where they were overhauled, cleaned and new jewels and shafts placed where there was the least doubt of imperfection, and then sealed the meters with putty at every conceivable place where dust or insects could possibly get into the works, and our loss for jewels and shafts since 1896 has not been five dollars, and further with nearly 200 meter consumers, we have had no meters to overhaul and inspect on

account of running too slow on light load or stopping. We have repeatedly taken out meters to recalibrate and it is seldom we are required to take off the case to readjust.

Speaking of ampere meters at this day, they are not the meters to adopt in placing new orders. The many objections to watt-hour meters, when ampere hour meters were supreme have all been overcome and there is no excuse to-day for purchasing a meter that will require, with proper handling, little or no time in meter-testing rooms, compared with the old types yet in use.

Another great saving in central station work is the calibrating of meters. There are several excellent bulletins to be had from the several manufacturers of meters that should be kept among the files of every testing room, and will clear away much of the dreaded task to the already over-worked superintendents, so that they will take to their work in a testing room with better and more satisfactory results. Do your own testing and repairs; save for your company and as a good man is always worthy of his hire, his company will reward him accordingly.

I would call attention to the calibration of meters. Careless calibrating or badly managed meter practice means the loss of hundreds of dollars and is a matter of great importance. For this work a central station should make the necessary investment in proper instruments and fit up a place, away from the central station, which is not subjected to too much vibration or exposed to dust. In the selection of instruments, among other things, a correct stop-watch is of the greatest importance which, saves time and makes work lighter and testing more rapid.

Every central station should have a meter book wherein is recorded the class and serial number of meters, when purchased, when placed for service, and when taken out and returned, and also a memorandum of all testing done, giving the time of calibrating, cleaning, etc. From this book a slip memorandum can be made showing daily where each meter is located and its serial number. No meter should be placed in service without a ticket having dials to correspond with the face of the meter showing its index, when taken out of meter room, the consumer's name, number of meter, when placed in service, by whom, etc. > When a meter is returned to the station or testing room for any cause, the same course should be pursued as to making out index of dials on the ticket referred to, which ticket should be numbered in series, placed on file in your office, as they go to make up your account books and daily sheets.

With a proper system of accounts and books, expense can be reduced materially, and I file with this paper for the examination of the members of this association, leaflets and blanks which have done wonders in the reduction of expenses of our company. You will see here a book in the nature of an invoice where all bills are pasted seriatim as they are paid. No bills or accounts are paid until first pasted in this book. On the margin of this account, which is "carbons," we mark No. 4 arc, This is transferred to a book showing monthly expenses, to line No. 4 under column of arc dynamo, and is an expense not chargeable to any other account. This book of statement of expenses on the left hand page contains 58 heads of accounts each account numbered, commencing with account No. 1, boiler and furnace, repairs of; No. 2, belting and repairs of, and so on. To the right of these accounts you have as many columns as you may desire, for instance, a column for arc lighting for street use, a column for commercial arc lighting, a column for commercial and residence incandescent lighting, another column for power service, and so on. On the right hand page of this expense book are shown, first, the earnings, then the expenses, then earnings and expenses, showing net earnings, with proper rulings which show the earnings and expenses for the same period during the previous year. On this page you have your monthly balance sheet, which shows the total output in watthours for arc, incandescent, motor work, and the like. From this page you can in a very few moments calculate the cost per arc light unit or incandescent or power service, also show the number of series arc lamps installed, the number of incandescent arc lamps and incandescent lamps installed.

From this condensed statement of expenses if there is anything wrong in any one account you will notice it at a glance. For instance, in carbon account, No. 4, there are good arc light trimmers and there are also very poor ones. Some trimmers use more carbons than others. At different times of the year there is a saving in carbons and without this book you could not well detect it. Each and every account heretofore enumerated in the book of statement of expenses needs monthly examination to successfully detect unnecessary and wasteful expenses in the management of a station. Take the item No. 49 "Waste." waste bills for the year before adopting this record were \$49.80, the year following less than \$10. How did we make this saving? We found out exactly what waste it took in ounces per day to do our work and then held one person responsible for the weighing out for daily use the amount taken from a large box kept under lock and key and made for the purpose. This book was what pointed out to us the frequency of the bills in the first place, and our investigation as to where the waste went caused the adoption of the above methods. A careful examination of the blanks before you, will at a glance show that there are many avenues where you can save small amounts, and altogether worth the while.

You will all concede and do realize that you must have some feasible system to work by if you are to compete with municipal "sharpness." Too much stress cannot be put on the keeping of a good system of books by every company, to the end and with the view of reducing expenses. I have met owners of electric light plants who stated that all they knew of their business, how money was derived from it, was through their bank deposit book only. I have in mind one company in particular, whose method was so lax, and who depended upon their bank book, that they were led to believe that they were making money; they said so, other people and strangers said so; they believed they were making money, but strange to say they are now reaping the whirlwind. They have managed to receive a small interest on their investment, the principal has disappeared and the value of their plant for the amount invested will not bring them 10 cents on the dollar, and on the other hand, they are met with the competition of a municipal plant which has turned out to be as disastrous a failure for the taxpayers.

In conclusion, I will say that all local companies on account of the abnormal increase in cost of supplies, and other conditions heretofore enumerated, have arrived at a point where

better methods will need to be adopted for the prevention of waste, not on cheese-parings and candle-ends method, but by more and more attention to economies of operation, both inside and outside of their stations, and by the use of intelligent methods of charging for current consumed.

# INSTITUTION OF ELECTRICAL ENGINEERS.

(From our London Correspondent.)

It will be remembered that a deputation from the above Institution visited Switzerland for a week's tour in September, and made an inspection of all the electrical engineering works there. The Swiss Visit Committee has now issued its report in which it outlines the leading features in the various undertakings. A special meeting of the Institution was held on Thursday, January 11, at which the report was discussed. The discussion was introduced by Mr. R. E. B. Crompton by "A Comparison between British and Continental Practice in Electrical Engineering."

The data relating to the various electric tramway systems is not only interesting but valuable and is in part as follows:

THE STANSSTAD-ENGELBERG ELECTRIC RAIL-WAY.

(Built 1897-1898. Opened in September, 1898. Visited Thursday, September 7.)

Driving Power—Water from spring with reservoir, 415 meters above the power station Obermatt.

Route—Stansstad-Stans-Engelberg, a part of which from Obermatt to Gherst is laid with rack, the rest with adhesion rails.

Electric System—Three-phase alternating current at 750 volts from generators direct on to the trolley wire. For the other end current raised to 5,000 volts by two step-up transformers and transmitted on overhead conductors to two transformer stations in Dallenwyl and Stans and there transformed back to 750 volts; in addition there are special feeders taken from the generator station and transformer station; two overhead contact wires, the third being the rails; current collected by two bows.

Power Station—Three generators of 180 hp. coupled direct to high-pressure turbines, with a reserve: two separate exciters of 12 hp. direct coupled to high-pressure turbines, one reserve; generators with revolving armatures, holes stamped; three single transformers at 30 kilowatts 750/5,300 volts; liquid resistance used to take loads during descent of cars; two secondary transformer stations having three single-phase transformers of 30 kilowatts at Dailenwyl and Stans.

Route—Total length, 22,500 meters: gauge, 1 meter; rise, maximum on the adhesion track 50 per cent.; maximum on the rack line 250 per cent.

Tram Lines- System Vignole-Adhesion rails, rack system Riggenbach.

The Electric Conductors—Circuit breakers in the trolley line; wooden masts used throughout; telephone wires on the same masts.

Rolling Stock—7 cars each with 3 synchronous motors of 35 hp. (total 490 hp.) and with single-gear reduction; speed regulated by resistance inserted in the rotor circuit, by means of slip-rings and brushes; electric heating and lighting by special transformer in car; 3 electric locomotives with motors of 150 hp. (total 450 hp.) regulation as in the above case; wagons for carrying goods; each locomotive is fitted

with several mechanical hand and automatic brakes.

#### THE JUNGERAU RAILWAY.

(In construction since 1897. A part opened in the summer 1898. Visited Friday, September 8.)

Driving Power—Water power from the White Lutschine near Lauterbrunnen.

Route—Wengernalp-Jungfrau. At present trains run from Wengernalp to Eigerwand (3 kilometers).

Electric System—Three-phase current with 7,000 volts transmitted from generators by overhead wires; transformed to 120 volts for the lighting of Lauterbrunnen and Wengen, for boring, and at stations; transformed to 500 volts for locomotives and building purposes; 2 overhead contact wires, third through rails; connection made by two trolleys and slide contact-maker.

Power Station—Fall 40.8 meters, dam, sluices and grated doors, iron pipe 1,630 + 700 meters long; machine house for 4 turbines of which 3 are of 500 and one of 800 hp., system "Girard" with horizontal shafts and having two wheels at 380 revolutions; two turbines of 25 hp. at 600 revolutions for excitation; all turbines automatically regulated.

Electric Generators—2 units of 500 hp, and one of 800 hp, coupled direct (and insulated) to turbines; 380 revolutions per minute, 38 cycles, 7,000 volts, three-phase current; inductor type (stationary windings), high pressure, prepared and formed and then laid in slots.

Exciters—2 of 25 hp., shunt wound, direct-coupled to separate turbines; switching arrangements for parallel running and voltage regulation by exciter voltage, for three-phase or single-phase current (the latter case for lighting with one-phase).

Primary Conductors—Throughout bare wire overhead, on three-fold porcelain bell insulators mounted on masts of wood, with a maximum of 10 per cent, loss; power and light separate; There is a line length of 10 kilometers for the railway and also 3 kilometers for lighting; the wires from generator station to railway have a rise of 1,500 meters,

Lightning Protectors - Siemens & Halske horn-type lightning protectors at each end of the conductors, and on every pole is a pointed wire connected to the earth: transformer station in separately built houses, differing according to the lighting requirements: for the railway are two (later 3) transformers of 200 kw., 500 volts secondary pressure: in the lower part of the railway they are 2 kilometers apart, in the upper part (in tunnel) a station at each kilometer; transformers with 3 vertical iron cores, primary and secondary coils placed conaxially over one another.

Contact Wire of the Railway—Two wires of 9 mm, diameter of hard drawn copper fixed to wires drawn at right angles to contact wire, insulated and mounted on wooden masts. These masts also carry the feeders; rails, joined by railbonds, from the third conductor.

Present Route—Open way 2 kilometers; tunnel 1 kilometer; gauge 1 meter; Vignole rails and rack; average rise on the open 120 per cent, average rise in the tunnel 250 per cent.

Rolling Stock—4 locomotives so arranged that part of the wagon rests on the locomotive; each locomotive has 2 motors with a maximum output of 200 hp.; electrically heated and lighted.

Electromotors—8 small motors with threephase current for driving ventilators, pumps, etc., in tunnel work, altogether 50 hp.

Rock-boring Machines—Electrical percussion boring machines on the solenoid principle, continuous current, 6 machines being worked in the tunnel and 6 in reserve.

THE BURGDORF-THUN ELECTRIC RAILWAY.

(Built 1897-1899. Opened July, 1899. Visited Saturday, September 9.)

Driving Power—Water power at the Kander station.

Route—From Central-Bahn-Bahnhof Thun over Konolfingen (crossing the Bern-Luzern Railway) to the Central-Bahn-Bahnhof Burgdorf; the route Burgdorf-Hasle is worked in common with the Emmenthal steam railway The gauge is normal and the railway has its own line of rails.

Electric System—Three-phase current; tension of 4,000 volts at the Kander station and raised to 16,000 volts: transmission by overhead lines along the railway to the transformer stations, and there reduced to 750 volts; two contact wires and the rails form the three leads; trolley of the bow type.

Route—Total length of line 40,000 meters; three tunnels together 350 meters long; railway 536 to 770 meters above sea level; 3 large iron bridges and many small ones; gauge normal; minimum radius of curve 250 meters; maximum rise 25 per cent.

Rails—Cast-steel Vignole profile, weighing 36 kilogrammes per meter on iron sleepers for one-third of the distance; wood sleepers for two thirds of the distance.

Electric Conductors—High-tension conductors separate, not always following the railway, mounted on wooden poles; nearest point (starting point) of the railway 9 kilometers from the Kander power station; 3 wires of 5 mm. diameter copper; 45 meters average distance between masts, 5 per cent. maximum loss; 49 kilometers length of line and 27 tons weight of copper; contact wire, 750 volts, 2 overhead wires, hard copper 8 mm. diameter; holding up wires 35 meters (average) distance apart, with double insulators: 40 kilometers length having a copper weight of 36 tons and 15 per cent. loss.

Transformer Stations—14 distributed over the length of the route, in stations, each provided with transformers of 150 kilowatts in ribbed boxes and immersed in oil, and without further cooling: the transformer stations serve as towers for the wires and have forked lightning arresters with water resistances; a special wagon is used for making repairs and conveying the transformers.

Rolling Stock-2 electric locomotives with two axles coupled, 2 synchronous motors 300 hp, and cogwheel reduction; carriages for goods and passengers, total weight 28 tons, electrical equipment 10 tons: 6 automobile carriages, 4 axles, i. e., with two bogies with two synchronous motors together 240 hp., and 66 seats, total weight 32 tons, electrical equipment 84 tons: locomotives and automobiles carry in front 2, and behind 2, contact bows to conduct the current to motors: locomotives and automobiles have the speed regulated by a variable resistance in the rotor circuit; they have small three-phase motors driving the air-compression plant of the Westinghouse brake; they can always be coupled to any carriage of the Swiss standard railway; they contain small transformers and switches for electric lighting and

electric heating.

Driving—Single and double passenger trains: consisting of two automobiles with carriages; speed 36 kilometers per hour (single train 55 tons) goods trains with locomotives run at half speed; steam engine in reserve.

#### PROGRESS OF AUTOMOBILES.

# Present Vehicle is the Result of a Long Period of Experiments.

With the advent of motor vehicles comes the search to find out the true history of self-propelled vehicles. From the most reliable sources it has been ascertained that automobiles were made more than 125 years ago by Cugnot, in France. It was a steam propelled wagon of an extremely crude appearance, but was the forerunner of the successful motor vehicles now seen in operation. It might be stated that Paris, up to a year or two ago, has always been the hotbed of automobiles, some of the great inventors in this line being Hancock, Church, Dietz, Gibbs and Frazier.

Hancock did his work during the year 1825, but did not complete his first motor until after five years' work. It was known as "The Infant," according to automobile history, but after two or three runs was declared to be hardly a success. A year later he built another wagon that cost about \$3,500. It burned about twelve tons of coke per hour and weighed about three tons. It could only travel on the best of roads at a speed of ten miles an hour, but withal could be termed the first successful motor vehicle.

Church later on built a vehicle to carry fifty passengers, being all out of proportion, and a few years previous to this time one Gurney built a carriage in England propelled by steam that made such frequent trips to the repair shop it was retired. It could not stand the severe strains of the uneven roads.

It was along in the fifties when Richard Dugeon constructed a wagon propelled by steam made to carry ten people.

Ten years ago France began to talk more of the automobile industry, and has advanced with rapid strides until it is now considered by many to lead in this line with America close on its heels. All classes of motors are in use in Europe, including hydrocarbon, gasoline, electricity and steam, with the gasoline more in favor. It was not until six years ago that America began to pay much attention to the business, and even a race, organized in the fall of 1895, by the Chicago "Times-Herald," was won by a German automobile owned by H. Muller & Co., of Decatur, Ill. In a later race, for which the Chicago paper offered \$5,000 worth of prizes, a greater variety of automobiles were entered. It was a fifty-four mile run, in which a number of foreign carriages were entered, and this product distanced all the American wagons that were entered, although part of the latter was forced to retire owing to accidents. It was a day of rain and snow and a very severe test of the vehicles entered.

In June, 1896, an automobile race was held in New York under the auspices of the "Cosmopolitan," and was won by the Duryea wagon. This last affair aroused interest all over the country, and everyone began inquiring into the business of self-propelled vehicles. Innumerable inventors are now at work on motors of various kinds, while companies are being formed to market what is considered the coming vehicle. All kinds of power is being used, each of which has its adherents, and this all important question can only be settled with time. That the sport of operating automobiles is bound to meet with favor cannot be denied by those who talk with enthusiastic automobilists. The new organization, the Automobile Club of America, is doing much to enlighten the public on the use of motor vehicles, and similar affairs will doubtless be organized throughout the country as the number of automobilists increase. Nothing presents a brighter future during the years to come than the sport and trade in motor vehicles.

### THE ARNOLD MAGNETIC CLUTCH.

In the design of the modern electric power plant it is frequently found desirable to arrange the generators in such a way that they may be readily connected or disconnected to the prime movers according to the exigencies of the service. This requirement of successful power station design was early realized by Mr. Bion J. Arnold, of Chicago, a pioneer in this field of engineering, who recognized at the same time the limitations of the ordinary friction clutch for this purpose. Accordingly,

in any desired amount. The energizing circuit is controlled by means of a switch placed at a convenient point, which is quite a decided advantage over the ordinary friction clutch. It thus becomes possible in throwing a generator in or out of service to control it entirely from the switchboard, where all the regulating devices and measuring instruments are within the reach of one attendant. These magnetic clutches also possess the advantages of neat appearance and compact design. Even in the larger sizes the amount of space occupied upon the shaft is not much more than twice the diameter of the shaft, and by using a flange forged solid on the end of the shaft, they can be made to occupy even less space when used as cut-off couplings. Owing to their having no projecting surface or parts to catch the air when in operation the windage resistance is negligible. The greatest advantage, however, of this form of clutch over others is the fact

FIG. 1.—THE LARGEST MAGNETIC CLUTCH IN THE WORLD.

some years ago, Mr. Arnold worked out a device which would meet modern requirements, and the result has been the development of the Arnold Magnetic Clutch, a number of which have already been built.

These clutches are in reality friction clutches, yet the friction between the contact surfaces is not due to mechanical pressure, but to magnetic traction. The working parts of the clutches are composed of metal having a high permeability so arranged as to become magnetized upon the passage of direct current through the coils with which they are provided. The two parts of the clutch can be attracted together in this way with a pressure far in excess of that obtained in mechanical clutches, and it is only a question of making the clutches large enough to enable them to transmit power

that it is self contained—the "action and reaction" being within the clutch itself, and consequently there is no resulting end thrust upon the shaft bearings and no additional friction load due to the operation of the clutch.

The illustration, Fig. 1, shows the largest magnetic clutch in the world. It is 100 inches in diameter, and is capable of transmitting 3,000 horse-power at 150 revolutions per minute. This clutch is one of three now in use connecting the engines and generators in the central station of the Imperial Electric Light, Heat & Power Company at St. Louis, a view of the equipment of which is shown in Fig. 2. The experience with this plant demonstrates that this form of clutch is applicable to the large size units now being installed for power station purposes, whereas the ordinary friction clutch

becomes especially unwieldy and unsightly after passing the 500 horse-power size.

There seems to be no reason why a clutch of the type shown in the illustration cannot be substituted for the fly-wheel of the engine in many cases, thus making the weight and cost of the engine unit, fitted with magnetic clutches, but little more than the weight and cost of the small installation fitted with ordinary mechanical couplings.

The current is carried to the clutch coils through contact rings upon the side of the clutch, and carbon brushes held by insulated brush holders. The electrical connections are simple and easily accessible for inspection.

The unique feature of this clutch is the small amount of current needed. It requires no more than would be used by four 16 candle

SOME INTERESTING FAULTS ON TELE-PHONE CIRCUITS.\*

BY "BUSYBACK."

Fault telephone and other circuits are due to a variety of causes, which, for our present purpose, may be put under the following heads: storms, electric light or power circuits, faulty construction and ordinary wear and tear.

Ordinary storm faults are caused by poles, wires or other parts of the outside circuit breaking down because of the excessive strains to which they are subjected, thus causing disconnection, short circuits and earth faults. Such faults as these are of frequent occurrence and of no special interest, so they need not concern us further at present.

ing damaged, but it will be useless till the piece of paper is changed.

For an ordinary pattern of telephone lightning arrester to fail in preventing a discharge through some of the coils of the instrument is a very common occurrence; most frequently it is the bell coils which suffer and are fused, though not always. In one case of a fault caused by lightning, which I distinctly remember, one of the coils of the double-pole receiver was fused, as it was impossible to change the disconnected receiver at once, the faulty coil was taken out of the circuit and the receiver left working on one coil. A few days later there was another thunderstorm, during which the remaining coil of the receiver was fused, and consequently the instrument was rendered useless till the

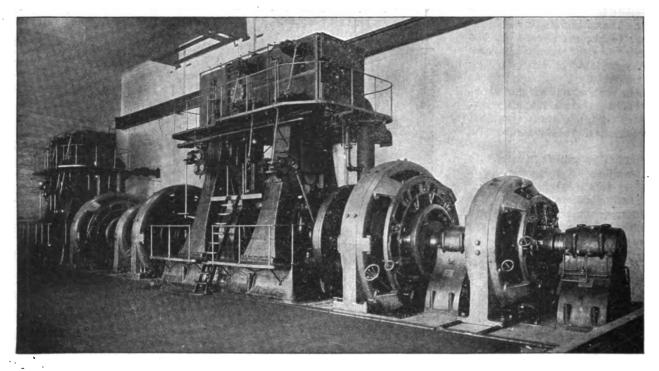

FIG. 2.—MAGNETIC CLUTCH CONNECTING ENGINE AND GENERATORS.

power incandescent lamps, and the loss in the clutch due to the continuous use of the electric current, while the clutch is in operation, amounts to only one-hundredth of one per cent. of the power transmitting capacity.

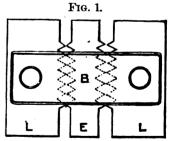

Although these clutches were developed for use in connection with the "Arnold System" of power station construction, their application is in no way limited to the demands of this system, and they have been adapted and adopted for other purposes. A number have been made to connect large synchronous motors to their load in such a way that they can be quickly disconnected in case of accident, and they have also been built for use upon line shafting. It would seem that they were particularly applicable to use in connection with gas engines, and there is no doubt an excellent field for them here. They might eliminate the flywheel problem of the gas engine in many cases, which of itself would be a distinct advantage. Indeed, there would seem to be no limit to their use wherever it is desired to transmit power from one shaft to another.

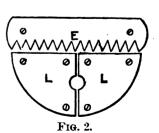

A scheme is under way for the development of the water power at Tetreauville, in Quebec province, on the Ottawa River and about two miles from the city of Ottawa, Can. The property along the shore of the river at the point has just been acquired by a syndicate of Ottawa capitalists which intends forming a company to be styled "The Chaudiere Electric Company."

Some of the most interesting faults which come under the first heading are those due to lightning discharges. It is not an unfrequent occurrence for the line wire to be used or damage done to the instruments by a flash of lightning; although all telephones which are intended for use on long distance circuits are provided with lightning arresters, lightning may disconnect or short-circuit them. One of the best forms of lightning arrester which has been fitted to telephone instruments has the disadvantage that while it prevents the instrument from being damaged by a lightning discharge, it is frequently found short-circuited after a storm. The construction of an arrester of this form will be understood from the accompanying sketch (Fig. 1), where L and L are two toothed plates in connection with the A and B wires of a loop circuit, E is a third toothed plate which is earth-connected, a piece of thin paper is laid over these and held in position by the strip of brass, B. When a lightning discharge takes place a spark frequently passes from the line plates, L and L, to the bar, B, and from this to the earth plate, E, making a small hole through the paper and carrying with it, in each case, a burr of metal which is sufficient to short-circuit and earth the instrument; this prevents the coils of the instrument from be-

\*From the "Electrical Review," London.

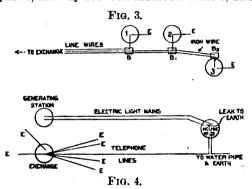

receiver had been changed. The cause of this fault was a badly made lightning arrester which did not admit of proper adjustment. An ordi-

nary pattern of lightning arrester, as fitted to a telephone, is made as follows:—L and L are two plates in connection with the lines, R is the toothed plate which is earth-connected. The three plates should be adjusted so that they are about one one-hundredth part of an inch apart.

One of the most interesting cases of damage by lightning which has come under my notice. occurred two or three years ago, and affected three separate circuits. The sketch of the positions of the affected circuits (Fig. 3), will make clear what follows. Circles 1, 2, and 3. represent three different houses with an ordinary telephone in each; B, B1, B2, represent small brick chambers with iron lids flush with the footpath, these chambers were joined together by earthenware pipes in which the wires (18 gauge copper, insulated with guttapercha and braided), leading from the exchange, about a mile away, were placed. Between chambers  $B_1$ ,  $B_2$ , there was one insulated wire and a length of No. 8 gauge galvanized iron wire with the ends left loose in each chamber, this wire was only to be used for the purpose of drawing other wires through the pipes. According to the inhabitants of the houses there was a very vivid flash of lightning, followed immediately by a loud peal of thunder; this flash of lightning fused the bell coil of No. 1 telephone, fused the induction coil secondary of No. 2, fused the wire and burnt through the gutta-percha covering of the wire to No. 3 telephone, midway between chambers 2 and 3, and

also fused the No. 8 galvanized iron wire which was lying in the pipe, volatilizing some of the zinc, which settled on the insulated wire for some distance. Instrument No. 3 was not damaged at all, and no damage was done in the exchange, beyond some of the lightning arrester points being burnt off and blackened by the discharge to earth.

The interesting point of this case of damage is that all the wire was underground, and the ends of the wires terminated in buildings, the wire could not therefore have been "struck," and the damage must have been caused by the return shock.

The points of toothed lightning arresters are frequently burnt off by discharges; other forms of arrester may have small pieces of metal torn off.

During a heavy thunderstorm in the neighborhood of a telephone exchange, nearly the whole of the line indicators fall simultaneously; if the storm is some distance away from the exchange, lines in the neighborhood of the storm pick up currents which are frequently strong enough to drop the indicators on these lines.

Electric light and power circuits nearly always cause a certain amount of disturbance on telephone circuits which are worked on the single wire system, now rapidly going out of date. When the light or power circuits are faulty, some curious troubles are experienced in the telephone exchanges, or on separate circuits which are near the affected circuits,

On one of my visits to a certain telephone exchange a short time ago, one of the operators complained that indicator No. 32 frequently fell and could not be replaced for some time, though no one was trying to call central from

the distant end: this most frequently occurred at stated times in an evening, and the current would sometimes be on the line for an hour or more, then all would be right again. This went on for several days, and as careful examination of the instrument and line did not show any defect, nothing was done. Shortly afterwards, the operator reported that the whole of the indicators, about 150, had fallen simultaneously several times. Inquiries at the house in which telephone No. 32 was situated revealed the fact that some electric light men were at work in the house; on cross-questioning them it was found that there was a leak to earth of 10 amperes when the lights in the billiard-room were turned on. The nearest telephone wires were 40 or 50 yards from the billiard-room, and these were carefully insulated. The cause of the trouble was this:-The telephone line was a single wire circuit with an earth return, the exchange was near the generating station, the current leaking to earth from the billiardroom must find its way back to the generating station, so a portion of it traveled along the water pipe, to which the telephone earth wire was soldered, along the earth wire, through the instrument, line wire and indicator at the exchange, to earth there, and so to the generating station.

When the leak to earth was stopped, no more trouble was experienced in the telephone exchange. The diagram (Fig. 4) will make the paths of the currents clear, and will also show why more than one indicator should sometimes drop. There must have been an earth in the generating station or near it, or the current would not have leaked back from the fault in house No. 32 to the station. The cause of other indicators dropping, as well as and at the same time as No. 32, was because one end of each of the indicator coils in the exchange was connected to the same earth wire, and their other ends, through spring jacks, to the various line wires. As the earth wire would have some resistance, the current would divide through all the paths to earth provided by the indicators, line wires, instruments, and earth wires at the various houses near the generating station.

#### WIRELESS TELEGRAPHY.

On the 18th, ult. Prof. Oliver Lodge delivered a lecture before the Glasgow Association, and in his discourse the general rise of electricity and the knowledge of electric oscillations were traced from the predictions of Clerk Maxwell in 1853 to the discovery by Hertz, and subsequently of the work of Branly, Righi, Bose, Popoff, and others. Prof. Lodge also referred to the work of Signor Marconi and Prof. Slaby in connection with the practical development of the wireless telegraph. To make the action of this more clear to his audience, Prof. Lodge likened the electrical discharge from the vertical wire to an impulse along the thong of a whip, whereby a great disturbance or whipcrack is communicated to the air in the one case, to the ether in the other; this is the sending of the signal. At a distant station a small fraction of the effect of this sudden disturbance is collected by a similar elevated wire connected at its lower end with a small tube of filings called a "coherer," introduced into an electric circuit with a battery and relay, so that when the electric stimulus arrives the filings cohere and convey the current, thus throwing over the tongue of the relay until they are tapped back and restored mechanically to their previously diconnected state. The operation of signaling was described, it being shown how the Morse signals could be transmitted and recorded. Farther on in his lecture Prof. Lodge explained that at the present time no attempt is made in practice to discriminate one receiving station from another. All within range, if sufficiently sensitive, can pick up the signal. There are methods, which the lecturer partly explained, whereby syntony can be obtainedthat is to say, where the sending and receiving stations can be tuned so as to respond to each other, but not to another station differently tuned. The attainment of tuning, however, at present restricts the range over which such telegraphy is possible—the radiating power of an attuned or syntonic instrument being less than the radiating power of an elevated wire just as it is more easy to obtain a loud sound out of a piece of string by using it as a whip-lash and cracking it, than by stretching it soundboard and plucking it. He remind He reminded his audience, in conclusion, that the sound analogy was simply used for the sake of explanation as the disturbances utilized in wireless telegraphy are etherial and not aerial. In this respect optical analogies were more correct, and there was a wonderful similarity between signaling by flashlights and wireless telegraphy.

#### A COMMENDATORY LETTER FROM THE CLEVELAND CHAMBER OF COM-MERCE.

THE CLEVELAND CHAMBER OF COMMERCE, CLEVELAND, O., Jan. 30, 1900. S To the Editor of Electricity.

SIR: We have read with interest your editorial of January 4, 1899, upon the reorganization of the consular service of the United States. Appreciating your efforts, we enclose for your consideration a copy of House bill 7097, introduced January 23 of this year by Hon. T. E. Burton of Ohio, and Senate bill 2661, introduced on the same day by Senator Lodge of Massachusetts. The two bills are identical.

A year ago the leading commercial organizations of the country appealed to Congress to effect a reorganization of the service. A special committee from the Chamber of Commerce of the State of New York and from the Cleveland Chamber of Commerce visited Washington, and urged the passage of the Adams bill then pending before the House. The bill, however, was not reached.

Since then the evidences of an increased desire on the part of commercial organizations and the public generally for an improvement of the consular service, have encouraged us to believe that Congress might be induced to pass a bill more immediately effective than the Adams bill, and embodying at once the reorganization of the service, which the Adams bill contemplated was to be arranged by a commission which should have two years in which to work. The two organizations mentioned, with the assistance of the National Business League of Chicago, and after consultation with officers of the State Department, and others of long experience in the consular service, have therefore perfected the enclosed bills. Many amendments were made by the gentlemen consulted, and the bills now before Congress represent the combined efforts of the commercial organizations mentioned and those especially qualified to judge of the requirements of the service.

Herewith we also enclose an explanatory statement of the bills, which will be of service.

We trust that you will feel disposed to use your influence to advocate the passage of these bills. Very truly yours,

H. A. GARFIELD, Chairman, Committee of Consular Reform.

#### LEGAL NOTES.

The initial proceedings in a suit in equity were taken February 1 in the United States Circuit Court of New York City by Thomas J. Montgomery against the General Carriage Company, organized in New Jersey. Mr. Montgomery alleges that he is entitled to \$1,000,000 of the carriage company's stock and \$300,000 n money which was promised him on May 3, 1899, when he transferred to Joseph H. Hoadley \$5,000,000 worth of the corporation's stock, rights for the territory within a radius of twenty-five miles from the City Hall here in the patent issued July 26, 1898, for improvements in electric self-propelling vehicles, to Louis Kriger. Mr. Montgomery asks the court to have his standing as a stockholder in the carriage company settled, and that the stock and money promised him for the patent rights which he turned over the Hoadley and on which he established the corporation in New Jersey be turned over to him.

William Boder was recently appointed receiver for the Miller Electrical Maintenance Company of Pittsburg, Pa. A bill in equity was filed by William McKinley, who states the company had a capital of \$30,000 and was made insolvent by mismanagement. Indebtedness, \$15,000; stock, \$10,000.

#### Proposals Invited.

The War Department, through the U.S. Engineer at New London, Conn., is inviting sealed proposals until March 2, for furnishing and installing an electric light plant at New London, Conn. Specifications and all necessary information will be furnished upon application to Major Smith S. Leach, New London, Conn.

Sealed proposals are being invited until February 24 for equipping the power house at the U. S. General Hospital at Presidio, Cal., with electrical machinery. Information will be furnished upon application to J. M. Marshall, deputy quartermaster general, San Francisco, Cal.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until February 13 for furnishing the New York Navy Yard with a quantity of electrical supplies. Blank proposals will be furnished upon application to the Navy Pay Office at New York, or to the Bureau at Washington.

#### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended February 3:

Amsterdam, 7 cases, \$1,200; Antwerp, 14 cases, \$1,561; Argentine Republic, 238 cases; \$15,765; Brazil, 250 cases, \$9,143; Bremen, 1 case, \$50; British East Indies, 3 cases, \$605; British Guiana, 12 cases, \$200; British West ndies, 218 cases, \$11,851; Central America,

cases, \$1,319; Chili, 22 cases, \$1,082; China, 25 cases, \$523; Ecuador, 5 cases, \$34: Frankfort, 1 case, \$25; French West Indies, 2 cases, \$42; Glasgow, 43 cases, \$1,468; Havre, 280 cases, \$33,703; Japan, 10 cases, \$1,799; Liege, 2 cases, \$200; London, 26 cases, \$2,022; Marseilles, 35 \*cases. \$1,353; Mexico, 158 cases, \$6,944; Newfoundland, 6 cases, \$123; Nova Scotia, 2 cases, \$188; Peru, 20 cases, \$323; Porto Rico, 13 cases, \$449; Siam, 44 cases, \$240; Southampton, 52 cases, \$1,101; Trieste, 14 cases, \$358; United States Colombia, 13 cases, \$103; Venezuela, 29 cases, \$277,

#### PERSONAL MENTION.

Col. W. H. Eckert, president of the Knickerbocker Telephone Company of New York City, has been making a tour through the country inspecting switchboards.

Mr. George Bullock has lately been elected president of the Cincinnati Edison Electric Light Company, in place of Wm. Cromwell, who resigned.

Mr. George A. Miller, special agent of the Bell Telephone Company, who has been located at Niagara Falls, recently went to Lockport, N. Y., where he will labor in the interests of the Bell Company.

Mr. James F. Noonan has resigned his position as foreman of the drop forging department at the Pope Manufacturing Company's factory of Hartford, Conn., to take a more responsible position in the factory of the Columbia Electric Vehicle Company on Laurel street.

Mr. George W. Bright has been chosen president of the Columbus (Ohio) Electric Company.

Mr. Herbert J. Somerset, operating manager of the Electric Street Railway of Winnipeg, Manitoba, has received and accepted the offer as general manager of the Perth tramways in West Australia. As under engagement, he left last week for his new position.

Mr. F. N. Armour, of New York City, has severed his connection with the Siemens & Halske Electric Company of

Mr. Wareham A. Chase, of North Calais, Vt., has recently presented to the Vermont Historical Society a valuable relic of electrical appliances in the early days. It is an electrical motor which he invented and constructed about 1842. It is elliptical in shape, and although crude in construction, works to a charm even now. This is conceded to be the first known electrical motor invented.

#### COMMERCIAL PARAGRAPHS.

We are in receipt of a copy of the second edition of the Power Catalogue just issued by the Sprague Electric Company, 527 West 34th street, New York City. This handsomely gotten up little work-for so it may justly be called-contains some 72 pages of interesting and instructive reading matter and illustrations. As the title indicates the subject dealt with is "power" as derived from and applied with the well-known Lundell Motor. Among other things an advantage of this make of motor is referred to as follows: "The most notable and unique feature of the Lundell Motor, rendering it superior to all others now on the market and placing it in a class by itself, is the novel construction of the field magnets, whereby the single energizing coil magnetizes all of the pole pieces, and the strong protective shell for the windings of both field and armature completes, the magnetic circuit. Various types of these motors are made, two-pole, four-pole or six-pole, but all embody the one common characteristic of the single energizing coil." As this catalogue contains a large number of efficiency curves and tables of considerable value, it should be in the hands of all persons who contemplate installing electrical machinery.

The Ward Leonard Electric Company of Bronxville, N. Y., has just issued Catalogue No. 1900, descriptive of high grade rheostats and circuit breakers manufactured by this well known concern. The pamphlet, containing over sixty pages, is profusely and handsomely illustrated and in it is to be found many tables and much information of value. Any person interested in this subject can obtain a copy of the catalogue by addressing the Ward Leonard Electric Company as above.

#### INCORPORATIONS.

The Australia Manufacturing Company, Fayetteville, N. C. -to distill turpentine and acid from stumps and light wood by electrical process. Capital stock, \$150,000.

The Tillamook Electric Light Company, Tillamook, Ore. Capital stock, \$30,000. Incorporators: J. C. Havely, J. F. Watt and Charles C. Hays,

The River District Light, Heat & Power Company, New York City-to manufacture gas and electricity for sale in New York City. Capital stock, \$50,000. Directors: James Douglass, Cleveland, O.; H. Dodge, E. M. Johnson, William H. Yale and John Jay McKiltey, all of New York City.

The Algonouin Electric Brake Company, Portland, Me.-to manufacture and deal in electrical or mechanical brakes for all purposes. Capital stock, \$100,000. Officers; President, Chas. M. Drummond; treasurer, Joseph Drummond, Jr., both of Portland.

The Electro Chemical Light & Heat Company, Camden, N. J. Capital stock, \$1,000,000. Incorporators: F. C. Dowd, P. A. Dowd and J. L. Gethins.

The Dayton & Troy Electric Railway Company, Columbus O. Capital stock, \$30,000. Incorporators: J. M. Wilson, W. L. Caten, R. L. Worrell, L. G. Reynolds and Thomas B.

The International Electric Traction Company, New York

City-to acquire and control patents on electric railways and devices. Capital stock, \$3,000,000. Incorporators: G. F. Kissam, H. E. Heeler. G. L. Campbell, I. Phenegar, J. W. Lytle, all of New York City.

The Kansas City Electrical Wire Subway Company, Kansas City, Mo. Capital stock. \$20,000. Incorporators: John Moore, Frank Hagerman, A. R. Dillon and others.

The Puerto Principe Electric Company, Trenton, N. J.-to furnish electric lights to Puerto Principe. Capital stock, \$200,000. Incorporators: Israel L. Kelsev, Robert A. Belancourt, Winthrop C. Bushnell and Samuel Moorehouse.

The Electric Power Company, New York City-to manufacture storage batteries for electricity. Incorporators: Charles L. Case, John D. Elwell, Ulysses S. Grant, Harrison S. Martin, all of New York, and William M. Dugall, of East Orange, N. J.

The Consumers' Light, Heat & Ice Company, Newport News, Va.—to operate an electric light, heat and ice plant. Capital stock, \$100,000. W. C. Stuart is president.

The Sandusky, Monroeville, Bellevue & Norwalk Traction Company, Sandusky, O. Capital stock, \$600,000. Incorporators: Harry Hughes, William E. Guerin, Jr., Clark Ruse, William W. Graham and W. P. Ruders.

The New England Electric Company, Denver, Col. Capital stock, \$50,000. Incorporators: George P. Yates and William

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FORRIGN PATENTS. at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR 4. MICHEL, Nos. 302 304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C.

Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED JANUARY 80, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

642,156. Street-Car Fender. Louis H. Reppell and John P. Groff. Kansas City, Mo. Filed March 3, 1889.

642,538. Armored Insulating Conduit. Andrew Thoma, Cambridge, Mass., assignor to Amanda M. Lougee, Boston, Mass. Filed July 29, 1899.

#### GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Albion, Neb.—J. S. Armstrong representing a company has asked the city council to grant a franchise for an electric power, lighting and heating plant.

Alexandria, Va.—This city contemplates the enlargement and improvement of its electric light plant.

Anderson. Ind.—F. Sargeant, an electrical engineer of Chicago, has plans for enlarging and rebuilding the electric light plant of this city, in accordance with the orders of the council.

Appleton, Minn.—The electric light plant owned by M. Crickmore was recently destroyed by fire.

Appleton City, Mo.—The citizens of this place are agitating the question of erecting an electric light plant.

Atlanta Ga.-The Commercial Telephone & Telegraph Company, 603 Prudential Building, is open for bids on electric lighting outfits.

Bainbridge, O.—The citizens of this place have voted an additional bond of \$2,000 to finish their electric light plant

Bay City, Mich.—The committee on electric lights is considering the question of purchasing a Corlies engine for the electric light plant.

Broadalbin, N. Y.—John L. Moore is a representative of the New York capitalists who are interested in estabof the New York capitalists who are interested in establishing an electric light plant here. The success of the enterprise is practically assured. Negotiations are under way for the purchase of two or more of the water privileges located on the Kennyetto to furnish power for the proposed plant.

Carlyle, Ill.—The city council will arrange for plans and specifications for the electric light plant to be owned and operated by the municipality.

Cloquet, Minn.—At a meeting of the village council it was voted to granta permit to F. McCormick of Duluth, to erect an electric light plant here.

Corydon, Ia.—The citizens will vote on a proposition to install an electric light system. It is proposed to issue bonds for that purpose.

Flint, Mich.—The question of the municipal owner-ship of the electric lighting plant has been before the council lately. The directors of the company have left the matter of purchase price of the plant to three arbitraters, and to accept either cash or bonds, at the

arnuravers, and to accept either cash or bonds, at the option of the city.

Gaines, Mich.—The citizens of this place are contemplating having the village furnished with electric lights.

Kansas, Ill.—The question of putting in an electric light and power plant by the municipality of Kansas is being agitated.

Lowellville, O.—Sealed proposals will be received until 12 o'clock noon February 17, by the trustees of the electric light works of this village for the installation of a municipal lighting station. Copies of specifications may be had from the trustees or J. H. McWilliams, clerk.

Mansfield, O .- The electric light question is to be agitated at the spring election.

Matthews, Ind .- The citizens of this place are agitating the electric light question.

Middletown, Conn.—The municipal ownership of an electric light and gas plant, agitated some time ago, has by no means died out and will probably come up for action by the incoming city councils.

Monte Vists, Col.—The citizens of this place will take steps toward putting in a municipal electric light

Muskegon, Mich.-Propositions to bond this city for \$40,000 to build a municipal electric lighting plant, will be submitted to the voters in the spring.

Nashville, Tenn.—The council committee is in favor of municipal lighting, and will press the passage of the bill giving the city the right to issue sufficient bonds to carry out the plan.

Omkis, Minn.—The citizens of this place contemplate the issuance of bonds, for the purpose of erecting an electric light plant.

Philadelphia, Pa.—The new Chambers-Wylie Presbyterian Church to be built on Broad street is to have an electric light, heat and ventilating plant installed.

Reedsville, Pa.—The citizens of this place are agitating the question of erecting an electric light plant.

South Haven, Mich.—The village council has decided to call a special election to vote upon the proposition to bond the village for \$1,000 to enlarge the electric light plant.

Stewartstown, Pa.--The council has passed an ordinauce accepting the proposition of a company from Baltimore to build and equip an electric light and power plant.

Tams, Iowa.—Municipal ownership of the electric light plant is being talked of here.

Tarboro, N. C.—Bids for the erection of a new electric light plant have been advertised for.

Topeka, Kan.—W. J. Faulkner of Chicago proposes to establish a gas and electric light plant in Topeka.

ELECTRICITY.

Tullahoms, Tenn.—The electric light plant of this place is soon to be enlarged.

Union Point, Ga.-The Union Manufacturing Company of this place wants to buy a 250 to 300 light dynamo for 20 candle power incandescent lamps.

Wallingford, Conn.—This town contemplates the erection of a new electric light plant.

Winona, Miss.—The Blackston Mercantile Company of this place, wants bids on a 2,500 light machine for an electric lighting plant.

Yonkers, N. V.—The board of aldermen has authorized a committee to consult with experts relative to the cost and requirements necessary for the inauguration of an electric light plant to be constructed and operated by the city.

#### STREET RAILWAYS.

Ashland, O.—The old project of an electric railway from Savannah to this place, as promoted several years ago by Mannfield capitalists, has been revived with a considerable show of serious business. It is reported that Chicago capital is back of the enterprise, and the \$2,000 necessary to start the incorporation going has been provided.

Attleboro, Mass. The lease of the Attleboro branch of the New York. New Haven & Hartford Railroad will expire in March, and the understanding here is that the lessee will purchase the property outright, and then equip it with electricity. The branch connects the main division with the Wrentham branch to Bos-

Du Bois, Pa.—The electric railroad of this place is to be extended to nearby towns. The towns to be reached by the new line are Falls Creek, Reynoldsville, Du Bois, Pa.-Rathmel, Eleanors, Big Soldier Mines, Sykesville and

Evansville, Ind.—The projectors of the Evansville & Boonville Electric Line have secured the right of way Vanderburg County over the pike, which cost \$75,000.

Ft. Worth, Tex.-Col. J. T. Voss, president of the Ft. Worth, Tex.—Col. J. T. Voss, president of the Polytechnic Glenwood Street Railway Company, and President Van Ginkle of the Dallas Consolidated Electric Street Railway Company, have perfected an agreement for the building of an electric rapid transit railway between this city and Dallas, a distance of about 30 miles.

Garrettsville, O.—It is stated on good authority, that the Chagrin Falls & Eastern Electric Bailway Company having nearly completed its line to Middlefield will at once commence work on its extension to this place by way of Troy and Hiram.

Gloucester City, N. J.—The Camden, Gloucester & Woodbury Electric Bailway Company contemplates extending its trolley line from Woodbury to National Park on the Delaware in the spring. It is now being surveved.

Irvine, Ky.—S. L. Tudor and others are interested in an electric road to be built in this town and sub-

Jacksonville, Fla. -W. C. Nelson of Chicago and J. S. Turner of this city are interested in the Jacksonville Rapid Transit Company in the city and suburbs. The city authorities have been asked for a franchise.

Mishawaka, Ind.—The Mishawaka Elkhart Goshen Electric Railway and all its appurtenances have been bonded for \$1,000,000 for an extension to Michigan City and other points.

Nashville, Tenn.—The Nashville Street Railway Company, which represents the consolidation of the various electric lines in this city and suburbs, will expend about \$1,500,000 in improvements. A portion of the road may be rebuilt and extensions made.

North Greenfield, Wis.—The town council has granted a franchise to Stutley Henderson and others for an electric railway to be built between Hale's Corners and this place.

Baleigh, N.C.—T. L. Eberhardt and others are in-terested in the proposed street railroad line from this city to Milburnie.

Bochester, N. Y.—An electric trolley line from this city to Canandaigua is a possibility of the near future.

St. Clair, Mich.-J. R. Whiting of this city is presideut of a company that will construct a line of electric railway from Lenox to Rochester, a distance of 18 miles, connecting with the Michigan Central at both ends

Washington, N. J.—Mr. Thomas A. Edison has in-terested Philadelphia capitalists to connect Hacketts-town, Washington, Easton, Lake Hopatcong and other towns by trolley. The route has been surveyed to within a mile and a half of this place.

Willimantic, Conn.—A local electric road will be built here in the spring.

Wilmington. Del.—The contract for building the New Castle & Delaware City Electric Railway has been awarded to the Delaware Construction Company of this city. The road will be about nine miles long, and will connect the two towns.

Youngstown, O.—The city council has granted the Youngstown & Sharon Electric Railway Company, the right of way over the streets.

#### MANUFACTURING, ETC.

Logansport, Ind.—The Dohner Foundry Company of Cleveland, O., has moved to this city and will manufacture electric street cars on an extensive scale.

facture electric street cars on an extensive scale.

New York.—The Edison, Jr., E'ectric Light & Power Company will manufacture small portable batteries for the illumination of mines at a small cost. Thomas A. Etison, Jr., recently said that orders had been received for about \$40,000 in batteries.—The Sprague Electric Company has contracted to furnish and install complete for the Plymouth Cordage Company, two 75 kw. direct connected generating sets, each consisting of a 14 by 14 Ames engine and a 75 kw. split pele generator. An order for two 30 kw. generators to be used in the works of the Whitehall Portland Cement Company at Cementon, Pa., has also been received, and one of the Sound steamboat companies has ordered a Lundell generator to furnish 250 lights for one of its steamers. erator to furnish 250 lights for one of its steamers.

Springfield, Mass.—The Stanley Electric Manufac-uring Company has completed and shipped five large alternating current generators, and an inspect necessary alternating current generators, and a handsome dark blue marble switchboard to the Merchants' E'estric Light & Power Company at New Orleans, La., valued at \$40,000. A number of smaller boards are being made for concerns in New Hampshire, West Virginia, New Jersey and Alabama.

#### COMPANY MATTERS.

Bellaire, O—The electric plant and laboratories of the Bellaire Steel Works, owned by the National Steel Company, were recently destroyed by fire, entailing a loss of \$100,000.

Bridgeport, Conn.—The Bridgeport Electric Light Company has sold its plant to the United Illuminating Company of New Haven for \$52,000.

Cincinnati, O -The Bullock Electric Manufacturing Company has recently turned out a large piece of machinery for the Oakland Transit Company, Oakland Cal. The machine is a 550 volt, 800 kilowatt engine type generator, developing 1,200 horse power. The armature alone weighs 23 tons. Three freight cars were required to transport the machine.

Dunkirk, N. Y.—The electric power house of the Dunkirk & Fredonia Street Car Company was recently destroyed by fire, together with all the cars.

Franklin, Pa.—The Franklin Electric Company wil give the smoke preventive invention of A. Pillatt, of London. a month's trial.

New Haven, Conn.-The Fair Haven & Westville Railroad Company has contracted with the Allis Works of Milwaukee, Wis., for two engines of 750 horre power each to be delivered next fall. Four new boilers will be contracted for later.

Owosso, Mich.—The Owosso & Corunna Electric Railroad passed into new hands February 5, the own-ers now being Eastern parties.

Bye, N. H.—The Boston & Maine Railroad Company has purchased a lot of land from E. C. Jenness, upon which there will be a building erected to be used for electrical purposes in connection with the new electrical railroad.

San Jose, Cal.—The works of the Electric Improvement Company were recently destroyed by fire. loss is estimated at \$100,000; insurance, \$50,000.

Trenton, N. J.—Another enterprise of John A. Roebling's Sons Company is the Woven Steel Hose & Cable Company incorporated recently in this city. The company is capitalized at \$100,000, and will manufacture sheathing for wire, cables and electrical conductors.

Conn.—It is understood that the Waterbury waterbury. Conn.—It is understood that the Connecticut Lighting & Power Company has purchased what is known as the old Jones property, valued at \$3 000. There are rumors to the effect that the land will be utilized for the construction thereon of a power house about the time the line to this city is ready for operation.

#### **AUTOMOBILES**

Buffalo, N. Y.—It is reported that Charles B. Hunt-ley of the Buffalo General Electric Company, and other well-known business men of this city, are organizing a company for the establishment of a new automobile cab service. They have ordered from the Woods Motor Vehicle Company 15 cabs, which will be put into service as soon as they arrive.

Denver, Col.—A great deal of interest is centered in the experiment of a line of automobile 'buses on Eighth avenue. A company has been formed to operate the system, and will place an order for fif.een of the latest type of double deck automobile 'buses, which will be operated by electricity, and have a seating capacity each of twenty people. The promoters expect to have the system running in April.

New Haven, Conn.—Thomas B Lasher purchased an electric vehicle from the Riker Electric Vehicle Company's booth at the Automobile Show held in New York. Mr. Lasher expects to be able to introduce his system in the near future.

New York.—All of the fifty motor vehicles on exhibition at Madison Square Garden were sold at fincy prices. O ders are booked for the factory capacity far prices. O'ders are booked for the factory capacity is into the spring. In fact the metropolis has taken such an interest in automobiles that the manufacturers have announced their intention of holding another exhibition in the Garden. It will be for "autos" only and will be opened next October.

# THE TELEPHONE WORLD.

#### The Independent Companies of Michigan Combine.

A combination of all the independent telephone companies operating in Michigan was effected recently at a meeting held at Grand Rapids. Every company in the State was represented except South Haven and Saginaw, both of which, however, had, previous to the meeting, signified their intention of joining with the other companies.

The new combine will have control of over 21,000 'phones

n towns and cities in Michigan, and it is claimed will own more miles of toll lines in the territory they cover than any other company.

Outside of Detroit it is claimed the independents are considerably stronger than the Bell Company, are accessible to more towns and used by a greater number of people. While definite plans regarding the management of the new system are not matured, it is the general purpose of the organizers to leave the details of the management of local offices to the officers of the company now employed, and only to govern from the central office the larger business deals. The chief purpose of the combination is to offset the effect of the recent purchase of the Detroit company, and to strengthen the hands of the independent companies all over the State in their fight against the old company. In addition it is expected that with the entire system in Michigan under one executive head the various lines will be brought into closer touch, and better service for the company's patrons will result. The companies represented at the meeting were:

Citizens' Telephone Company, Muskegon, C. T. Hills and William Robinson.

Saranac Company, Henry Frace and S. M. Crawford.

Lansing Company, B. F. Johnson and Thomas Gunnison. Union Telephone Company, Gratiot and Isabella counties, C. F. Brown and C. O. Trast, Alma, and G. W. Robinson,

Vestaburg. Traverse City Company, George Gane and C. W. Wheelock. Oceana Company, E. F. Fuller and S. P. Hyde

Howard City Company, C. T. Sing and W. F. Nagler.

Adrian Company, ex-Mayor W. O. Hunt.

Kibble Company, J. H. Tripp.

Kalamazoo Company, C. S. Seitz and H. H. Everhart, Dowagiac Company, W. F. Hedden.

St. John's Company, J. T. Milman and J. H. Fildew. Cassopolis Company, William Jones

Peninsular Company of Jackson, C. K. Perrine.

Eaton County Company, W. C. Osborne. Kalkaska Company, C. W. Swaverley and A. J. Hostetler,

Shipshewana, Ind. Owosso Company, C. W. Gale, R. W. Crawford and T.

Kincaid.

Grand Haven Company, J. W. O'Brien. McBride's Company, C. H. Laflamboy.

Benton Harbor, J. R. Pierce.

Lake Odessa, George A. Weed. Sunfield Company, J. H. Palmer.

Reed City, C. F. Marshall.

Grand Rapids Citizens' Company, C. F. Rood, Judge C. E. Perkins, E. B. Fisher and J. B. Ware.

The stockholders of the Cumberland Telephone & Teleraph Company met in Louisville, Ky., on the 25th ult., to ratify the consolidation with the Ohio Valley Telephone Company, of Louisville, under the name of the former company. The capital stock will be \$10,000,000 and the shares will be \$100 each. Stockholders in the Ohio Valley Company will receive equal shares in the new company. The consolidation was decided on at a meeting of the directors at Hopkinsville, where will be the headquarters of the consolidated company. The Cumberland will control ten thousand miles of wire, eleven thousand toll stations and territory from Louisville to New Orleans. The two companies are the largest in the South, and have gradually been securing control of all the rival lines. The Ohio Valley Company controlled the systems in Louisville and New Albany, but it was bought out and absorbed last spring. J. E. Caldwell, of Nashville, is at the head of the consolidated companies. Of the \$10,000,000 capital \$2,500,000 is paid up.

The Kinloch Telephone Company stockholders held their annual election of directors recently in St. Louis. Mo. All the directors were re-elected for another term, as follows: Samuel M. Kennard, William F. Nolker, William D. Orthwein, Breckenridge Jones, Hopkins J. Hanford, C. K. Dickson Walsh, Adolphus Busch, Ellis Wainwright, Julius S. Walsh, Charles H. Turner, C. Marquard Forster, August Gehner and George J. Kobusch. The directors will meet within two weeks to elect officers. The company now has over 6,000 subscribers, and the largest independent switchboard in the world in their

The plant of the Missouri & Kansas Telephone Company operating in Kansas City, Mo., will be improved and the sys tem extended during the present year. It is proposed to expend in the neighborhood of \$500,000.

#### The Ericsson Telephone Company's Series.

The Ericsson Telephone Company, 296 Broadway, New York, is getting out a series of interesting pamphlets containing telephone information of value. In Vol. I, Part 2, which is before us, there appears among other things an interesting review of the telephone situation in Sweden which

is well worth reproducing. The article says:
"The first telephones were installed in Gothenburg and
Stockholm about 1880 by the Bell Company. The rates were high, and a rival company appeared in 1883 in the form of a co-operative society. Each member was to be responsible for the cost of his instrument and proportion of operating expenses, and pay yearly about \$20. Sweden was soon full of these companies. We might say that this useful assistant to everyday life invaded the seclusion and quietude of villages and towns heretofore not found in the geography.

"This new company in Stockholm and Gothenburg began to compete for business at lower rates than the Bell. It was an experiment that was ridiculed by the old company, and the ruin of the competing societies was predicted. The contrary was the effect, and at this writing the Bell Company has been driven from the field. This General Company, in 1884, began to extend its field, and began the construction of trunk lines. It proved a success. The Government became alarmed lest its telegraph system should suffer. After the matter had been discussed to a standstill by Parliament, and the King himself asked to decide, the Government decreed that the State, post and telegraph department should have exclusive right to erect intertown wires except within a radius of 43½ miles about Stockholm. In this latter territory the General Telephone Company was allowed to construct where it wished. The surface about Stockholm is the best telephoned part of the globe. To own the trunk lines and not those in the large cities appeared to the Government officials as a short-sighted policy. The local exchanges then began to be purchased by the State. The Bell in Gothenburg was the first company to be acquired by the Government. In making this and other purchases the price was not arrived at by any computation of earnings or value of installation, but the State made a bid and the companies throughout the Kingdom, with the exception of that in Stockholm, were only too anxious to surrender to the Government, shorn as they were of their existing right to construct trunk lines.
"The Government, having entered the field about 18%, did

its work well. All circuits were metallic, and wires, wherever possible, were put underground. Since 1894 the wires in Stockholm have all been underground. The General Company of Stockholm could not be intimidated into disposing of its lines, and, in consequence, at the capital we find now the only competition in the kingdom. The subscribers to the State system have many advantages over the subscribers of the General or competing company, but its figures are dearer (\$12.50) than those of its competitor (\$11.75). It may be said that the telephone business is now practically in the hands of the State, without competition, except at Stockholm. The success of low rates has been more strange on account of the frequent necessity of employing submerged cables, on account of the lay of territory to be covered. I must mention that most of the ships entering the harbor are connected with telephonic communication while lying at their wharves.'

According to the "News" of Saginaw, Mich., an officer of the Valley Telephone Company recently received the following telegram from Mr. H. A. Everett, president of the Cuyaoga Telephone Company of Cleveland and of the United States Telephone Company: "In view of the circulation of a report that the United States Telephone Company and other independent telephone interests which are identified with it are either now, or hereafter, to be included in the transfer of the Detroit Telephone Company to the Bell Company in Michigan or elsewhere, you are hereby authorized and requested to say for me that such statements are absolutely and wholly false, and calculated, and, I believe, intended to influence other independent telephone people. You are further authorized and requested to say for me that the report that I was present at, assisted in or know anything of the negotiations for the sale of a controlling interest in the stock of the Detroit and New State Telephone companies, is a lie, made of whole cloth. The United States Telephone Company and allied interests have placed orders for a very large amount of material to be used by them during the present year, in completing their systems in Ohio, and making connections with like properties in adjacent States, and this work is to-day being vigorously prosecuted and will be until it has been completed."

A plan is being considered to organize a local telephone company and put in a system in Chehalis, Wash. The town has about sixty telephones in use, but the plant is owned by the Sunset Company. It is believed that a local company could lessen the tolls so that the service would be much larger and of greater benefit to the public. The council may be asked to grant a franchise at an early day,

#### A Meter for Telephones.

A dispatch from Paris, France, to the N. Y. "Herald" states that for a long time the French Government has been studying the question of cheapening the telephone service. and now under the regime of M. Mougeot, under secretary, it is thought probable that some satisfactory solution will be arrived at.

The whole thing pivots on the use of a compteur telephonique, which is nothing more than an attachment used like a gas meter, and which is connected with each telephone instrument installed in house or office, and measures exactly the amount of electricity used.

Each conversation is supposed to last exactly three minutes. The compteur which begins work when communication is established between two persons, is so delicate that the voices of those conversing must be distinct before the machine

When the three minutes are up the compteur breaks off the communication, which, however, may be continued by once more pressing a buttom.

Each month a man comes around to the house or office, just as does a gas company employe, and verifies the consumption of electricity at the rate of fifteen centimes (three cents) for each conversation of three minutes.

The advantage claimed is that each subscriber to the telephone sees before him the exact sum which he is to pay and thus all disputes are avoided, and so the compteur replaces the fixed tariff.

Every one has to pay according to the actual use to which the instrument is put. This will, of course, be a loss to persons who use the telephone every minute of the day, but, on the other hand, it is easy to see its convenience and economy to persons who only use the telephone moderately.

It is supposed that this system will increase the number of subscribers, and that the telephone will be much more in use than ever if this new system is inaugurated in France. the tariff will be 40f. (\$8) a year subscription fee, and the price of the telephone apparatus installed in each house 120f. The last named sum may be paid in installments of 60f. (\$12), 40f. (\$8) and 20f. (\$4). Then there is added to this price the regulation 15c. per three minutes' conversation, as shown by the compteur, so that an outlay of 160f. (\$32) for the first year, plus the actual work done, represents the cost of telephoning from one's own house in Paris, should the new system come into vogue.

But to offset all these advantages, which look so tempting on paper, there is a serious difficulty accompanying cheap telephoning, which means increased subscribers.

As the case now stands one has to wait quite long enough to get communication, owing to the immense amount of work exacted of each telephone girl at the central and branch telephone offices, so what would be the effect of an increased number of subscribers ?

However, if this difficulty be overcome, which is quite possible, then the proposed new system will be a distinct advance and the telephone system worthy of the opening of a new century.

It is rumored that the absorption of the American Bell Telephone Company by the American Telephone & Telegraph Company, official preliminary announcement of which was made on December 2, 1899, has been postponed until autumn. Officials of the Bell Telephone Company, when questioned with regard to this rumor, refused to deny or affirm it. The reason assigned for the delay in carrying out the plan is that the passing of necessary legislation, particularly at Albany, will require a longer time than anticipated, and that also it has been deemed best to allow the matter to rest during the present session of the Massachu setts Legislature.

At a recent meeting of the directors of the Goshen Tele phone Co., of Goshen, Ind., arrangements were completed to merge the local company with the independent lines of the county at a capitalization of \$100,000; the valuation of the local company being placed at \$30,000, and the Elkhart Company at \$35,000. The Hon. Charles W. Miller is the president of the new company. The combination takes in all the independent toll lines of the county, and arranges for the pur-chase of a half interest of the independent toll line from Goshen to Lagrange, which has been owned by the Lagrange Independent Company.

The Central New York Telephone & Telegraph Company is said to have purchased of the Western Union Telegraph Company its poles from Oneida to Rome via the turnpike. The Western Union Company removed the wires some time ago to their main line beside the New York Central Railroad tracks. Preparations are being made by the telephone company to rewire these poles and establish a metallic circuit be tween Oneida and Rome.

The Home Telephone Company of Richmond, Ind., has decided to increase its capital stock from \$100,000 to \$150,000 to allow for the construction of more toll lines.

### ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 157@16c.; Lake, 16@16ic., casting, 151@153c.

The American Wireless Telegraph Company, Milwaukee, Wis., has been incorporated with a capital of \$1,000,000

A movement is said to be on foot to amalgamate all automobile and bicycle interests in this country in a \$200,000,000 trust.

The Excelsior Telephone, Telegraph & Subway Company has been incorporated in New Jersey with a capital of \$5,000,000.

The Utica Belt Line Street Railroad of Utica, N. Y., will lease the Suburban Railroad line from Whitesboro to Oriskany, guaranteeing its bonds.

The stockholders of the Commercial Cable Company will hold their annual meeting on March 5. Books close February 21 and reopen March 7.

Gross receipts of the Chicago Union Traction Company for January increased \$55,362; for seven months ended January 31 the increase was \$318,000.

The report of the Metropolitan Street Railway of New York City for January shows gross earnings of \$1,162,352—ahead of January, 1898, by \$117,803.

August Belmont & Co. are behind the McDonald Rapid Transit tunnel contract arry out the undertaking as to the cash deposit of a million and the bond for to carry out t

The Chicago Telephone Company has filed with the County Recorder a certificate of increase of its capital stock from \$5,000,000 to \$15,000,000, authorized at the recent annual meeting.

The Westinghouse Manufacturing Company has declared a quarterly dividend of 14 per cent. on common stock, payable February 2). Books close February 12 and reopen February 21.

Mayor Van Wyck, of New York has signed the rapid transit bill. It has been sent to Albany were it is expected Governor Roosevelt will sign it at once. This permits the city to sell tunnel bonds in various amounts.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 17(2,20; New York Electric Vehicle Transportation, 9(2)91; New England Transportation, 6(2,6)2.

The Chicago "Tribune" states that at the annual meeting of the stockholders of the National Carbon Company, on February 26, Arthur J. Eddy, of Chicago, who promoted the Company, and others will resign. Their places will be filled with men familiar with the business.

At a recent meeting of the directors of the Worcester. (Mass.) Electric Light Company, it was voted to increase the capital stock from \$300,000 to \$400,000. The purpose of this President Rogers informed a reporter, was to secure capital to enable the corporation to underground its system.

The Chicago Telephone Company, by John M. Clark, President, and Charles E. Mosely, secretary, on Saturday filed with Recorder Simon a certificate of increase of capital stock of the company from \$5,000,000 to \$15,000,000 This is in 150,000 shares of \$100 each. The increase was determined upon by the directors of the company at the annual meeting of the company held on January 17.

The United Power & Transportation Company, under the direction of President John A. Rigg, says the "Philadelphia Stockholder," is steadily widening its field of operations. It controls trolley systems and electric lighting plants in Wilmington, Del., New Jersey, Norristown, Reading. Lebanon, Wilkes Barre, and other cities. Its latest acquisition is reported to be the Southwestern Traction Company, of Philadelphia. of Philadelphia.

The semi-annual dividend of 2½ per cent. has been declared by the Northern Ohio Traction Company on its preferred stock of \$500,000. The company is the first to pay a dividend of all companies which have ever owned the local system. The company has announced that several improvements will be made during the coming summer, which will include double tracking the main lines.

A dispatch from Chicago says that a postponement is announced in the date for the payment of the second \$5 installment on the shares of the Illinois Electric Vehicle Transportation Company. With it comes the official information that a proposition is under consideration for the reduction of the capital stock from \$25-000,000 to \$2,500,000,and the par value of the shares to \$10, instead of \$100. Only \$5 per share has so far been called.

The Brooklyn Rapid Transit directors met on the afternoon of February 1 and elected Anthony N. Brady as chairman and those officers: President, Clinton L. Rossiter; vice-president, H. C. Du Val; secretary and treasurer, T. S. Williams, and assistant secretary and treasurer, C. D. Meneely. The following directors were chosen as members of the executive committee, with the chairman of the board and president ex officio: A. R. Flower, E. H. Harriman, Walter G. Oakman, H. H. Porter and Henry Seibert.

H. H. Porter and Henry Seibert.

The Electric Storage Battery Company's sales for the year ended December 31, 1899, will amount to approximately \$3 500,000, an increase of nearly 200 per cent. over 1898, when the business was \$1,300,000. The current business is averaging about \$250,000 a quarter, or exceeding a rate of 6 per cent. on the outstanding capital stock. The company has at present in banks \$125,000; goods manufactured, but undelivered, \$500,000; bills outstanding unpaid, but good, \$750,000; total working capital, \$1,375,000. The company owes nothing except current bills, not exceeding altogether \$60,000 and has no bonded or other indebtedness.

altogether \$60,000 and has no bonded or other indebtedness.

A special meeting of the stockholders of the Imperial Electric Light, Heat and Power Company has been called for Sturday, March 10, to vote upon a proposition to establish a bonded indebtedness of \$1,500,000, to be secured by a deed of trust upon all the property of the company. Other business of importance will also be considered at the meeting. The Imperial Electric Light, Heat and Power Company was purchased a short time ago from its former owners for \$952,000. It was originally intended to capitalize the company at \$1,000,000, and to issue the same amount of bonds, which were to be sold to pay for the plant, but later it was ascertained that it would be necessary to make some extensive improvements A large bond issue was consequently found to be necessary. The Imperial Company was absorbed by the Consolidated Electric Company, with was incorporated for \$1,500,000.

Mr. Edward Lauterbach, counsel for the Third Avenue Railroad Company, is reported as saying: "The Third Avenue Railway has arranged to exchange all present indebtedness into 6 per cent. notes secured by mortgage running three years with the privilege to the company to retire any or all of the same at the end of any twelve months. The notes will not contain any clause permitting their convertibility into stock. This disposes of all the company's requirements except of about \$2.500,000 further indebtedness which may be incurred in connection with completing construction work. No payment will be necessary for some time in connection with such expenditures and the company has at least two different methods of obtaining supply money for this purpose and upon terms perfectly fair to the company. Within a short time after the issuance of notes it is intended to present a plan to stockholders for the permanent funding of the company's debt and for all other necessary purposes the principal feature of which will be a low rate bond to be first offered to stockholders but underwritten by the syndicate."

Vol. XVIII.

### EDITORIAL NOTES.

The Future of Wireless Telegraphy.

The gradual evolution of wireless telegraphy is to be analogous to the

evolution of the present telegraph system.

The first constructions by Morse were quite limited in practical working distances, and the present elementary experiments of Marconi and his imitators, are likewise limited and to about the same extent.

Marconi has lately operated over somewhat longer distances in his late exhibitions in this country than in his former trials in England and on the Continent; but he and his friends despaired of effective service, from present constructions, over a distance of one hundred miles. He is unable to concentrate the electric undulations into a bundle of rays, having a definite direction or to concentrate or focus them on the distant receiver. They diverge in all directions from the common center of the transmitter and they are wonderfully weakened by dissipation in surrounding space.

Some of our electrical authorities very much doubt the practicability of wireless systems of communication to distances beyond an unobstructed line of vision, on account of the earth's curvature, and for this reason we see some experimenters climbing mountains to increase the electrical horizon of vision, while others are dreaming of balloons and Eiffel towers.

Prof. Bell's telephonic toy became a commercial success when the microphonic transmitter came to his assistance, and Prof. Morse secured undying fame as a public benefactor when the automatic relay was used to take up his messages and, so to speak, reinforce the enfeebled electric current and thus enable the telegraph to be used as an instantaneous messenger from one side of a great continent to the other,

Wireless telegraphy, and later on a wireless telephony must soon pass through a similar development to secure a wide commercial utilization.

At present investigators are doubtful of their ability to send the undulations from the wireless transmitter along a well defined path of parallel rays.

Possibly all fundamental inventions arise from a consideration of analogies and we may find the solution of this problem in the analogy offered by the X-ray generating apparatus,

where vibrations are produced of a character quite closely resembling the vibrations produced by the wireless telegraph transmitter; the X-ray vibrations may be focused as well as made parallel in the line of their propagation. They may be projected in most any desired definite path with little dissipation of their energy in undesired directions.

The next perplexing problem is to keep one set of wireless telegraph instruments from interfering with any other set, and to preserve the secrecy of messages; the analogous solution of this problem may be found in the harmonic telegraph, as well as in the various multiplex systems; thus it appears from well known and practical commercial analogies that the wireless telegraph will undergo a process of evolution, fitting it for widely extended utility that will greatly lessen the cost of thought transmission, by lessening the cost of installations, by cutting out the heavy expenses of copper wire, insulations, poles, armor, conduits, and the cost of their repairs.

Buoy relay stations may possibly some day give us a system of trans-oceanic communication that will prove to be a formidable rival to our present feeble cable system.

The rapid appreciation in price of guttapercha is fast limiting oceanic cable construction, and a wireless substitute cannot come too soon.

With routes well defined, steam ships may be kept in constant communication with the world, and travelers on these miniature floating cities, may yet read their daily morning papers after breakfast the same as though they were at home.

It is well known that the philosophic conceptions of many of our great inventions originate in Europe, and in another column will be found a description of the latest attempt toward the development of the wireless telegraph, which is well worthy a careful perusal.

\* \* \*

Litigation Over Moving Pictures.

Last week the Commissioner of Patents in Washington rendered a final decision—at least

so far as the Patent Office is concerned—in the suit of Thomas Armat versus Herman Casler and Woodville Latham as to the priority of invention of moving picture machines. Previous to this decision Mr. Armat had won before the Board of Appeals of the Patent Office.

The machines that infringe are the biograph,

the projectoscope made by the Edison people; the cinematograph and the vitascope.

As things now stand exhibitors of moving pictures in all parts of this country as well as American exhibitors in many European countries, where patents have been taken out by Mr. Armat, will have to pay royalties. This monopoly of moving pictures is controlled by the Photo-Projecting Company, which was recently capitalized for \$500,000 under the laws of this State, and to which Mr. Armat has transferred all his patents.

That more will be heard of this matter, and that it bids well to become a "cause célèbre" and a harvest for lawyers, may be inferred from the fact that the case will be carried to the United States Supreme Court, and every effort made to have the recent Patent Office decision reversed.

\* \* \*

Congressional Measures of Great Importance. The fact that the exports of electrical machinery increased from \$2,523,644 in 1898 to \$3,143,336 in 1899 is significant of the rapidly spreading con-

viction among electrical manufacturers that it is imperative for them to seek in foreign countries fresh outlets for their productions. In this connection it is highly gratifying to note that Congress is beginning to recognize the growing importance of the export trade to the manufacturers of the country and is considering legislation designed to aid manufacturers in the enlargement of foreign markets for American goods. A number of measures with this object in view are now before the National Legislature, and an epitome of the more important ones is herewith presented. Manufacturers and merchants should take up these subjects in an energetic way and impress their views upon Congress, giving the various measures hearty support.

Manufacturers generally have long felt that some means should be taken by the United States to educate the men who are in the future to be the controlling element in the development of the trade and commerce of the country. Germany has made tremendous strides in the last few years in the development of her foreign trade, and it is due principally to the intelligence, enterprise and skill of the men sent by that country to all parts of the world. These men have been educated in the trade and technical schools throughout Germany, with the result that they are the bestequipped men in all parts of South America, Europe and Asia engaged in selling foreign goods. In order to put the United States on an equality with Germany in this respect Representative Fitzgerald, of Massachusetts, has introduced a resolution calling for the appointment by the President of a commission of five persons to investigate the trade and commercial relations of this country with other countries with a view to the establishment of a national commercial university in Washington. The author of the resolution deems such a university absolutely necessary if we expect to hold our own with the advanced methods of the English and German salesmen.

The efforts which manufacturers in every branch of industry have made during the past ten years to secure the establishment of a department of commerce and industries bid fair to be crowned with success. A bill to create such a department has been favorably reported by a sub-committee of the Senate

committee on commerce and a little more urging on the part of manufacturers will undoubtedly result in the establishment of the new department by the end of the present fiscal year. The new department will have complete jurisdiction over all matters relating to the manufacturing interests of the country, including the extension of foreign markets for manufactured goods.

Another meritorious measure is that asking for an appropriation of \$200,000 to enable the Philadelphia Commercial Museum to increase its facilities for supplying commercial information to chambers of commerce and other trade organizations throughout the country. The money is to be expended mainly in the work of completing the collection of specimens of merchandise, both foreign and domestic, now in the Museum, so that American manufacturers may be enabled to learn the grade of articles in their lines most favored by foreign buyers, and how goods must be packed for shipment to other countries. The bill especially provides that the data obtained by the Museum from its foreign agents and other sources shall be distributed free to trade organizations throughout the United States.

Other grist in the National Legislative mill includes bills to reorganize the consular service. to establish the metric standards of weights and measures, to incorporate the National Association of Manufacturers, for the purpose of giving additional stability to that organization, and for the appointment of a commission of industrial experts to study trade conditions in the Orient with a view of increasing American trade in that vast territory. It will be seen that all these various measures are designed to directly or indirectly promote the export trade of this country and as nearly every manufacturer is interested in the export problem the speedy passage of these measures should be urged upon Congress.

#### UNDER THE SEARCHLIGHT.

Notes and Comments on Various Topics.

B. H. SCRANTON, president of the American Electrical Heater Company of Detroit, reports that his concern has already forwarded an excellent exhibit to the Paris Exposition.

There is a clamor from the citizens of Washington, D. C., for three-cent car fares and all night service. Congress has been appealed to for the purpose of securing a reduction in the cost of fares. Washington is one of the few cities in the country where six car tickets are sold for a quarter, good on any of the different electric lines. Although this is better treatment than is afforded in most cities, the citizens are not satisfied, and a bill has been introduced requiring the sale of eight tickets for a quarter. The measure was introduced by Congressman Mesick and is now before the Committee on District of Columbia. American Street Railway Association is keeping a sharp eye on the bill, and is represented by Tom Lowry of Wisconsin.

Chrys Moller, formerly interested in a cable line in Sioux City, Iowa, has returned to America for the purpose of getting the equipment for an electric railway to connect the foreign quarter of Tien-Tsin, China, with the native walled city of one million inhabitants. English and Japanese capitalists have

secured the franchise, which is the first for an electric railway in the Flowery Kingdom. The railway will be three miles in length and the street along which it will run is one of the most densely populated in the world. The Chinese, Mr. Moller says, have no objection to electric railways.

MR. IRA A. McCormack, one of the popular electric railroad men of the country, formerly general superintendent of the Brooklyn Rapid Transit Company, and recently general manager of the Syracuse Rapid Transit Company, has been offered and has accepted the post of general manager of the Cleveland Electric Railway Company. His resignation from the Syracuse Railroad has been accepted by its board of trustees. He will leave as soon as the latter can determine on a successor. Mr. McCormack regrets that he is compelled to break the pleasant social relations he has established in Syracuse, but as the Cleveland opportunity is in the nature of a promotion he has decided to accept the place.

AMERICAN construction companies have been asked to bid on an electric power plant at Cuantla, Mexico; an electric power station at Rio de Janeiro, Brazil, and an electric railroad from Salonica to Langaza, Turkey.

THAT hustler in the street railway world, Mr. John I. Beggs, general manager of the Milwaukee Electric Railway & Light Company, has let a contract for 300 clocks which are to be placed in the street cars in Milwaukee. As these clocks are of the navy lever type used on battleships and calculated to withstand the concussion of heavy guns, it is expected that they will stand the vibration and jar of Mr. Beggs' street cars, not to mention the jarring effect of the street railway arguments in that city. The clocks are guaranteed for a year. Conductors are to set these clocks by Western Union time every morning and they are expected to be never more than a few seconds incorrect and to do away with any possible controversies about the hours when commutation tickets are available.

The Fire Department of New York is testing a two and one-half inch electric hose, which has just been introduced in Boston. Near the nozzle is a button, by pressing which the firemen can communicate with the engineer by a code of signals.

Special Plenipotentiary Kasson, on behalf of the United States, and Baron Fava, the Italian Ambassador, for his Government, at the State Department on Thursday signed a reciprocity arrangement under the third section of the Dingley act. This arrangement does not require the action of the Senate, but it does need the ratification of the Italian chambers. Until that has been attained it is deemed wise to withhold the full text of the agreement from publication. it was learned, however, that the concessions made by Italy to the United States are quite extensive, including reductions on electrical machinery.

THE Legislative Committee of the Builders' Exchange in Cleveland, O., is pushing a bill to compel electricians and men working in electrical construction to secure a license before being allowed to work in the business. The bill should become a law, as at present a great many unskilled and incompetent men

work in electrical construction, and this fact is a menace to both life and property.

A DISPATCH from San Francisco, Cal., states that the officers of the cable sounding ship Nero have received strict orders from Washington not to disclose the results of the survey for the Pacific cable, but there is a strong intimation that a splendid route has been found. The returns have been dispatched to Washington, and it is likely that the result will soon be officially announced.

WILLIAM STEINITZ, the well-known chess expert, was obliged to be confined last week in the insane ward of the Harlem Hospital of this city, owing to his having labored under the delusion that he was a walking dynamo and could give persons an electric shock at will.

WE desire to acknowledge the receipt of an exceedingly attractive and nicely gotten up little desk thermometer from the Shelby Electric Company of Shelby, O.

An idea of the extent of the work being done in the development of electrical power at Shawinigan Falls, Que., for the Shawinigan Water & Power Company, may be had from the fact that 13 steam derricks, 20 steam drills, 21 stationary engines are used in the works. A trunk railway line, three and a half miles in length, has been built, on which 94 freight cars and 3 locomotives are now in operation. In one day 985 car loads of stone were shipped, and the average daily shipments for the last six oreight weeks have been 700 carloads. About 700 pounds of dynamite are used daily, and a stock of 2,400 pounds of the same explosive is always on the spot. The head race will be 1,900 feet in length and 125 feet deep, and the crib dam, it is said, will be one of the largest built on the American Continent.

REFERRING to the shell factory of the Boers recently destroyed at Johannesburg, the "Electrician," London, states that all the machinery in the plant was driven by electric power, and that originally it was the largest engineering works of the kind in South Africa, the machinery alone having cost some \$400,000.

JOHN O'LEARY of Cohoes, N. Y., has been granted a patent on a convertible motor car, Mr. O'Leary already holds three patents on a car of this type. He will exhibit his models to State railroad officials in Washington, Philadelphia and New York.

A GREAT enterprise has been started in Venice, Italy, for supplying the city with electrical energy from water-power plants established on the rapidly descending rivers, Cellina and Piave. The State Department has received a report on the subject from United States Consul Johnson, of Venice, in reply to an inquiry from a New York export association. Among other things Mr. Johnson says: "The Cellina, with an annual average capacity of twelve cubic meters (423.7 cubic feet) per second and in two falls of the combined height of 100 meters (328 feet), is able to supply Venice with electrical power equivalent to 10,000 horsepower at a distance of fifty-nine miles. The Government is ready to grant the concession and the work can be begun immediately. The Piave offers more favorable conditions. From the latter would be derived fifteen cubic meters (529.7 cubic feet) per second; that is to say,

one-third of its capacity in the dry season, which would serve to feed Lake Santa Croce at a level of 380 meters (1,246 feet) above the sea. From the water of overflow, which would serve for the irrigation of the plain between the Piave and the Livensea, 27,000 horse-power can be conducted.

A CABLE dispatch from Germany to a daily paper states that German alarm at the American plan to transport to Moscow, Russia, and there display the bulk of the United States' exhibits at the Paris Exposition, will surely bring forth a counter exhibition, which will be made possible by the granting of State assistance. The Russo-German Society of Berlin is perfecting plans for an iron industrial exhibition at Moscow, so that at the same time, after the Paris fair, there will be German, English and American exhibitions in the second capital of Russia. The German manufacturers of motors, tools, manufacturing machinery and implements will be represented.

RECENT experiments in New York City have shown the possibility of conveying medicines through the skin, and into any portion of the human body, by placing them in the path of an electric current. Gout, rheumatism and consumption are now being treated by utilizing electricity to convey drugs to the affected parts, and, while no positive cures have been wrought, results have been attained that seem to demonstrate the value of the new treatment. Dr. Samuel G. Tracy, who has been experimenting in this line, in a recent interview is reported as saying: "I do not pretend to have discovered the use of electricity to introduce drugs through the pores of the skin. Electricity was thus employed by Richardson in England to produce voltaic narcotism in 1859. Nothing practical came of the experiments made at that time, but within the last two years it has again been taken up by physicians in Europe, and one or two in this country. Cataphoresis is the name medical men give to the method of introducing drugs into the system through the pores of the skin or through the mucous membrane, instead of by the mouth or hypodermically. Cataphoric action is purely a physical process. It may be illustrated by placing an equal amount of liquid in two receptacles separated by a membrane, and passing an electrical current through from one to the other. The liquid will flow through the membrane in the direction of the current, from the positive toward the negative pole. Now, if a drug is placed in a specially prepared positive electrode, which is held against any portion of the body, and the negative electrode is applied to another portion of the body, the medicine will be driven through the skin and taken up by the blood vessels and fluids of the body."

M. ALIAMET describes in a French contemporary, "L'Electricien," a neat combination of ammeter and voltmeter in one case for use on electric automobiles. The instrument in question, says the London "Electrical Engineer," is made on the Weston principle, but the maker's name is not given. It consists of two sets of permanent magnets with iron cores, round which two movable fine wire coils with indicating pointers are pivoted. One of these is connected up as a voltmeter across the terminals of the accumulators, with a resistance in series with it. With this in-

strument the voltmeter is made to read up to 120 volts. The ammeter coil is connected to a low-resistance shunt in the main circuit. The ammeter is made to read in two directions, being graduated up to 40 amperes for the charging current and 100 amperes for the discharge. The scales on the face of the instrument are, of course, on two different levels, the voltmeter pointer moving on a plane slightly above that of the ammeter pointer. The graduated scale of the voltmeter in this way obscures the larger part of the ammeter pointer. The idea of combining the two instruments in one case is a good one, as the space available for such instruments on an electric carriage is limited.

#### The Automobile Trust Ready for Business.

Mr. F. D. Carley of New York City, who is vice-president of the big \$75,000,000 Anglo-American Rapid Vehicle Company, is reported as saying: "We intend—and we feel that we can carry out our intentions—that this company shall bear a stronger relation to automobile interests than the Standard Oil Company does to oil interests." Mr. Carley also stated "that he would leave Wall street to devote himself exclusively to this automobile company."

The Anglo-American Automobile Company comprises six of the largest British automobile concerns and the Studebaker, Riker and other big American plants, and has more than two hundred patents recognized all over Europe and this country. Its board of directors includes Sir Edward Sullivan and H. B. Twyford. The president of the company is W. W. Gibbs, of Philadelphia, who some time ago sold his interests in the big American Vehicle Company to William C. Whitney. C. E. Platt, a Philadelphia millionaire, is secretary-treasurer. The company's estimated output for the coming fiscal year is forty thousand auto-vehicles.

The company has taken the Victoria Hotel property at Fifth avenue and 27th street, this city, for show-rooms and will have more than thirty types of vehicles on exhibition soon. Mr. Carley also said:

"This corporation has in view solely the manufacture and sale of automobiles. It is not in any sense a stock operation. The stock has been placed in trust and no portable certificates of deposit will be issued against it."

#### A Large Telephone Order.

The Mississippi Valley Telephone Company, Minneapolis, Minn., has recently placed an order with the Stromberg-Carlson Telephone Mfg. Co., Chicago, for the complete equipment for a branch exchange in St. Paul and also additional equipment for increasing the Minneapolis exchange, which is being made up and furnished as rapidly as possible.

While the completion of the two exchanges has been somewhat delayed, owing to the scarcity of raw material, it is however, progressing as rapidly as can be expected in a system of the extent of the two plants.

The two exchanges, when completed, will represent an investment of more than a million dollars and all the capital has been furnished by J. C. Hubinger, "America's Starch King." of Keokuk. Iowa.

King, "of Keokuk, Iowa.

These plants, when completed, will without question be the largest individual telephone holdings in the independent field. The plants are constructed first-class metallic throughout and are equipped with the S-C. "Central Energy" system and multiple switch-boards.

Both the Minneapolis and St. Paul exchanges are now in operation and the plants are being rapidly extended.

#### LONDON NOTES.

# [From our London Correspondent.] Electrical Engineers and the War.

The interest which American electrical engineers took in the Spanish-American war is being repeated among English electricians at 🤻 the present moment. In addition to numerous officials from municipal and other lighting stations in different parts of the country who have volunteered for active service and been accepted, a party of fifty electrical engineers who along with Major Crompton recently offered for South African service have received notice that their offer has been accepted. This party is already furnished with six searchlight equipments and \$7,000 is being subscribed privately among the electrical profession for furnishing the men with personal comforts. In addition to this the war office has set apart \$15,000 for thoroughly equipping the detachment in order that the greatest possible benefit may be obtained from the services. Searchlight and other practice is now proceeding at Chelmsford where Messrs Crompton's electrical works are situated. It will of course be at once gathered that this offer is the direct outcome of the formation in 1896 of the Royal Engineers Electrical Volunteers in which the late Dr. John Hopkinson took so active an interest.

#### Electrical Patent Litigation.

On January 22 a very important action commenced hearing before Judge Farwell in the Chancery Division, London. It is taken by Mr. Martin Rucker, of company promotion fame, who has become the owner of certain Zipernowski and Deri transformer patent rights, which he claims have been infringed by the London Electric Supply Corporation and about half of the electric lighting authorities throughout the kingdom. All the parties likely to be affected by a decision have banded themselves together and are sharing the costs of the defence, although the only defendant whose name appears is the London Electric Supply. The fight promises to be a good one for experts, for upon the opening day about a dozen electrical engineers more or less eminent were in attendance. Lord Kelvin, Prof. Silvanus P. Thompson and Mr. Swinburne were among the number. It looks as though the case may last a week or more, and probably then the judge will take time to consider his decision as is usual in these cases. There is the usual array of eminent counsel. The fight is by far the most important piece of electrical litigation that has happened here during the past year or two, although there is considered to be not much doubt as to what the result will be.

#### To Meet Steamships.

George H. Daniels, general passenger agent of the New York Central & Hudson River Railroad, has added a steamship bureau to the equipment of the passenger service of the road. He has engaged Captains Louis Ingwersen and F. A. G. Schultze to superintend the bureau. and one of their duties will be to meet all incoming transatlantic and the principal coastwise steamships to assist passengers who wish to leave the city via the Vanderbilt system. Capt. Ingwersen will have charge of the American, Cunard, White Star, Atlantic Transport, Wilson, Anchor and Allan-State lines, and Capt. Schultze has been assigned to the North-German Lloyd, Hamburg-American, French, Rotterdam, Red Star and Thingvalla lines.

# A LIFE TEST OF INCANDESCENT LAMPS.\*

#### BY GEO. D. SHEPARDSON.

About three thousand years ago a famous engineer and electrician built on a high hill a temple so thoroughly protected that in the thousand years of its existence it is said not to have been struck a single time by lightning. This wise man one day wrote: "Of making many books there is no end, and much study is a weariness to the flesh." Had he been a modern electrical engineer, he might have added: "Of making incandescent lamp tests there is no end, and much report of them is a weariness to the flesh." Yet new books are useful in presenting old or new truth in a fresh light; so tests of incandescent lamps may be useful in calling attention to points that may not be familiar to all and that are not realized by all. In this paper it is not intended to present a general discussion of the whole lamp situation, nor to give a resumé of what others have done, but simply to report results of certain tests a little out of the usual order.

The general subject of the importance of testing incandescent lamps, together with a report and discussion of the results of an extensive and careful test of lamps made by a large consumer, may be studied in an excellent article in "Electrical World and Engineer," of March 18, 1899, Vol. XXXIII, page 337, and in a valuable pamphlet published by the General Electric Company. For the test mentioned above, lamps of twelve different factories were purchased in the open market and were given a preliminary test for uniformity of candle power and wattage. Four makes of lamp were rejected at once on account of lack of uniformity. Ten lamps of each of the remaining makes were selected for a life test, those being selected which came the nearest to the standard rating and efficiency. This test may therefore be taken to show the best results of the best lamps of the best makers.

In order to discover what is likely to be the experience of the buyer who lacks either the ability or the inclination to test all lamps received, and to reject those which do not meet his specifications as to candle power and wattage, the following experiments were carried on in April and May, 1899. To secure average conditions prevailing in the Northwest, lamps rated at 16 candle power were picked at random from the stocks of the Minneapolis General Electric Company, the St, Paul Gas Company, the Faribault Gas & Electric Company, the Owatonna Electric Company, the Electrical Engineering Company of Minneapolis and from the agents of two lamp factories which were already represented by lamps secured from other sources. Current was kindly furnished by the Minneapolis General Electric Company. The experiment was conducted by Henry A. Hildebrandt and Arthur C. Pratt, senior students in the University of Minnesota. The lamps were run on an alternating current line whose voltage was maintained constant within a range of two volts, a recording voltmeter giving a continuous record of the fluctuations. The candle power, wattage and efficiency of the lamps were determined with direct current and a Lummer-Brodhun photometer with Weston voltmeter and Whitney milliamperemeter, which were calibrated before and after the test. The standard of light was a well aged incandescent lamp which had been standardized by a certified amyl acetate lamp and by standard candles, being frequently checked by a second and similar standardized incandescent lamp.

Ten lots of lamps from seven lamp factories were first tested for candle power and wattage at their marked voltage. shown by the tables [on page 85] the initial candle power of the 55 lamps varied from 14.1 to 23.0, while the watts per lamp varied from 47.3 to 71.3, the watts per candle varying from 2.32 to 4.10. The average candle power of the lamps of each group varied from 15.2 to 22.0, while the average watts per lamp varied from 49.0 to 66.4, and the average watts per candle varied from 2.42 to 3.60. The general average for the 55 lamps given a preliminary test gave 18.3 candle power at 55.8 watts, or 3.1 watts per candle. This indicates that the central stations in this Association are using lamps of higher efficiency than was common a few years ago, also that there is still a wide range in the candle power, wattage and watts per candle of the lamps in use. It might be noted that the watts per candle were specified on only one lot of lamps, another being called "of standard efficiency," while a third lot was called "high efficiency," the latter taking about three watts per candle.

The different lots of lamps were marked A. B, C, D, E, F, G, H and I, and four lamps were selected at random from each lot except I and H. The ratio between the mean horizontal candle power and that in a certain marked position was carefully determined. Lamp sockets were wired to heavy leads, and resistances were adjusted so that each lamp received the voltage marked on the label. The sockets were placed so that the lamps were horizontal and each lamp was always placed in the same socket in order to make the conditions of dropping alike for all. At intervals of about 24 hours, each lamp was removed to the photometer and tested for candle power and current. Each lamp was allowed to burn until the end of the test or until it broke or met an accident. It was not thought advisable to throw out each lamp when it dropped to 80 per cent. of its initial candle power, since it is believed to be the exception rather than the rule for the smaller stations (not excepting most of the larger) to pay much attention to the "smashing point" or economical life of an incandescent lamp unless a customer complaines about poor light. (It might be considered unprofessional to inquire how many of the stations represented in this convention have any regular system of removing old and inefficient lamps.)

After burning about 50 hours, it is found that the light varies from 8.2 to 23.0 candle power, while the watts per lamp vary from 45.7 to 72.1, the watts per candle varying from 2.32 to 4.10, the general averages being 17.5 candle power at 55 watts per lamp and 3.27 watts per candle.

After about 100 hours, the light varies from 10.1 to 22.3 candle power, the watts from 45.5 to 72.1 per lamp and from 2.52 to 5.02 per candle. The general averages are 17.5 candle power at 55.3 watts per lamp and 3.30 watts per candle.

After about 400 hours, the light varies from 11.3 to 19.0 candle power at 46.6 to 70.2 watts per lamp and 3.00 to 4.31 watts per candle. The averages give 16.0 candle power at 56.5 watts per lamp and 3.54 watts per candle.

After about 600 hours, the lights vary from 11.4 to 18.8 candle power at 44.0 to 69.9 watts

<sup>\*</sup>Paper read at the eighth annual meeting of the Northwestern Electrical Association, Milwaukee, Wis., Jan 18, 1900.

per lamp and 3.34 to 4.26 watts per candle. The averages give 14.7 candle power at 55.6 watts per lamp and 3.82 watts per candle.

A few lamps were burned 800 to 900 hours, after which time the candle power varied from 10.8 to 16.4, while the watts per candle varied from 3.60 to 4.40.

Early in the test it was noted that several of the lamps "burned blue" and their high efficiency pointed to an early demise. All four of the lamps of lot A had burned out in about 100 hours and none of those in lot B lasted more than 500 hours, only one of them lasting 350 hours. These two lots were from lamps bought by a large company who contemplated changing lamps, and it is not certain whether these lamps were high economy lamps sent for trial or whether they were lamps intended for lower voltages but marked to suit the voltage ordered. Their performance suggests that the lamp makers find it necessary to dispose of their product and must mark their lamps to suit orders if the orders persistently call for lamps of the same standard voltage. It emphasizes the request made by some of the lamp makers that stations would find it to their advantage to adopt some odd voltage in order to use the lamps which must be made to supply other standards.

To get some comparison between the behavior of lamps on constant potential circuit and those on a circuit with poor regulation, several lamps were placed on a circuit varying from 104 to 118 volts. The lamps so placed were not sufficiently numerous to give close conclusions. The high efficiency lamps all died within about 300 hours, while most of their mates of like make on the well regulated circuit were in fair condition at 800 hours. The candle power and efficiency of the lamps on fluctuating circuit fell in 300 hours as much as did that of the lamps on the constant potential circuit in 800 hours. The lamps on the circuit with voltage fluctuating 13 volts aged at least three times as rapidly as their equals on a circuit fluctuating two volts. Such a statement can only give a rough idea of the general effect since the result of a fluctuation depends upon whether it varies above or below the normal. The lamps of low initial efficiency (that is, those which took 3.5 to 4.0 watts per candle) withstood the extreme variation much better than did those of higher efficiency, as was to be expected.

After the above test had been ended, some of the lamps were placed on the photometer and the voltage was raised until the candle power equalled the initial value. Three lamps marked for 108 volts were raised to 111.4 volts and to 112.6 volts to restore them to their initial candle power. Another lamp marked for 110 volts, which had burned 558 hours on the circuit with widely fluctuating voltage, was raised to 120 volts before its candle-power equalled that of its youth. The efficiencies of these lamps at the higher voltage were from one to eight per cent. lower than their original efficiencies. This seems to justify the practice of some engineers who move old lamps to places on the circuit having higher average voltage. To what extent the economical life of a lamp may be extended by raising the voltage from time to time, is a matter that seems worth investigation. In this connection it should be stated that very few of the lamps showed any considerable blackening, so that the loss of light and efficiency with age seem to come more from change in the filament than from absorption by the coating inside the bulb.

tion by the coating inside the bulb.

As a matter of interest, several lamps were gathered from various sources and their candle power measured while dirty with the accumulations of time and after the same were washed off. The light was increased from one to thirty per cent. The following are the tables:

#### ISLE OF MAN ELECTRIC TRAM-WAYS—WATER POWER UTILIZA-TION PLANT.\*

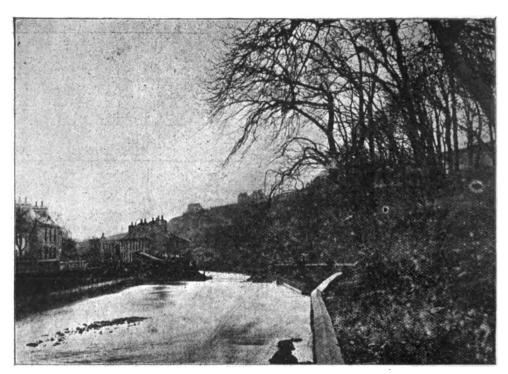

The Isle of Man Tramways & Electric Power Company have recently put into operation a water power plant in connection with their Douglas-Laxey and Ramsey electric lines; and the successful results obtained have enabled them to shut down their steam plant entirely, the entire line, 18 miles in length, being worked solely by water power. The line in the summer time is used for tourist traffic, when the load on the several power stations reaches about 2,200 hp., but for about seven months each year the line is dependent on the local passenger and freight traffic, which is comparatively light. The water power scheme, which was originated by Mr. Alexander Bruce, J. P., the chairman of the company, was designed by Mr. J. Shaw, A.M.I.E.E., the general manager and engineer, to work the line during these seven months, when the traffic is considerably reduced, and when it is necessary as far as possible to keep down the expenditure. As all the coal used by the company has to be imported from South Wales, the financial saving will be considerable.

The Laxey River, which is seven miles from the Douglas and 11 miles from the Ramsey termini, has been utilized for obtaining the requisite power. The water has been taken after it leaves the "washing floors" of the Great Laxey Lead Mines, and the tail water is discharged direct into Laxev harbor, the total fall being 41 ft., which, after deducting pipe losses, etc., allows a working fall of 38 ft. As part of the water is used for ore-washing purposes at the Snaefell and Great Laxev Mines, it contains an immense quantity of sand, and special precautions have been taken to prevent this from reaching the turbines. The head work consists of a concrete weir 40 ft. long by 4 ft. 6 in. high, built across the river. At one end of the weir are two masonry archways 5 ft. wide by 5 ft. high, each fitted with a sluice gate and the necessary gear for raising and lowering the gates. The two gates are separated from the river by means of an iron grating 55 ft. long by 5 ft. 6 in. high. During floods a large amount of debris is washed down the river, and the gratings protect the gates from being blocked. Inside the gratings is a large settling tank for the sand, the tank being emptied by opening the gate nearest the weir, which is used as a bye-pass for flushing purposes. The other gate is at the commencement of the head race, which consists of 826 ft. of trench 5 ft. wide, followed by 474 ft. of trench 3 ft. 6 in. wide, the depth of each being 4 ft. 6 in. The first of these two sections was made larger in area, to allow the water to travel slowly and settle any sand which might have passed through the first settling tank. At the end of the larger section of race another settling tank has been formed by dropping the bottom of the trench 6 in. for a distance of 50 ft., and providing it with a 12 in. flushing valve. At the end of the second section of race is built a masonry head box 8 ft. by 11 ft. by 7 ft. 9 in. deep, from which the water is conveyed to the turbines by means of 820 ft. of steel pipes 3 ft. diameter. The head box has also been built to act as a settling tank, thus preventing any sand from entering the pipes. An overflow weir 20 ft. long has been built about half way along the race, the surplus water being conducted to the river through an underground conduit. Owing to the bad nature of the ground, the whole of the head race has been constructed of concrete, with the exception of one short length built of masonry. The pipe line, which had to be kept several feet above the ground, is supported on masonry piers. The pipes are made up of in. steel plates with double-riveted seams, and are fixed in 15 ft. lengths. The joints are made with Kimberley collars run in with lead and well caulked.

The tail race is 624 ft. in length, 10 ft. wide, and 13 ft. 3 in. below the floor of the turbine house, and terminates in Laxey harbor. The turbine house is 1,100 ft. away from one of the company's steam power stations, and is a stone building 30 ft. long by 15 ft. wide by 12 ft. high. The fall from the level of the weir to the center of the turbines is 26 ft., the remaining 15 ft. fall being obtained by means of draft tubes. The turbines are of the "Victor" horizontal type, and consist of two independent 12 in. turbines in one casing with the shafts direct coupled, so that, when there is only a small

the steam station. They comprise one generator panel, together with automatic switch, ammeter, voltmeter, positive and negative switches, shunt regulating switch, starting switch and resistance to work the generator as a motor for driving the booster when the water is low, and a recording wattmeter. The booster panel contains switches for controlling a motor driven booster in the steam station, and also the switches for controlling the turbine booster-viz., positive and negative switches, voltmeter, ammeter, shunt regulating switch, recording wattmeter, and change-over switches to connect either the turbine booster or motor booster to any of three feeders. Adjoining the generator panel is a small panel for controlling in either direction the two 1 hp. motors for regulating the turbines. A small pipe has been carried from the head race, and is attached to a gauge glass fixed in a prominent position near the switchboard, so that the attendant can see the height of the water in the head race.

The turbine plant is worked in connection

ISLE OF MAN ELECTRIC RAILWAY. VIEW ABOVE WEIR, SHOWING TOP WATER INTAKE.

amount of water available, one turbine will be used, thus enabling the plant to be worked at its best efficiency. The turbines will develop 140 hp., at a speed of 720 revolutions per minute.

The electric generating plant consists of a combined bipolar dynamo and booster, the generator having an output of 160 amperes at 520 volts and the booster 160 amperes at from 100 to 200 volts. The generator and booster are coupled to the turbine by means of a friction clutch, which permits of the plant being used as an ordinary motor driven booster in the summer time when the river is very low. The turbines, generator and booster are provided with self-lubricating bearings, and are capable of maintaining long continuous runs without heating. The mains from the generator and booster and the regulating wires are carried overhead to the steam power station previously referred to, from which the turbine plant is entirely controlled. Two Lundell & hp. motors, driven from a small storage battery, are used for opening and closing the turbine regulators. The switch panels for the generator and booster are attached to the main switchboard in

with three battery sub-stations, each containing 250 cells of the chloride "R" type, one at Laxey, at the foot of the Snaefell mountain railway, and the other two about five miles on each side, all three stations being worked in When the cars are taking current parallel. the turbine generator is assisting the batteries, but when the cars are descending the grades or standing, the generator is charging the batteries. During the night time, when the cars are not running, the booster is connected in series with the generator, and the batteries are in turn charged at a heavy rate and at a high voltage through the underground feeders. This enables a full load to be maintained continuously on the turbines. The Isle of Man Tramways & Electric Power Co. were the first in the United Kingdom to use storage battery substations for traction purposes, and they find these have proved exceedingly useful for working a long line with a minimum amount of

The turbine plant described above has just completed a 240 hours continuous test, during which it maintained a steady load varying from

<sup>•</sup> From the "Electrician," London.

three-fourths to full load; and although the turbines are not provided with any governor, it was not once necessary to alter the regulation.

The turbines and pipes have been supplied by Mr. F. Nell, of Queen Victoria street, London, and the generator and booster by the Electric Construction Company, of Wolverhampton. The construction of the weir, water courses, and buildings, and the erection of the plant were carried out by the company's staff under the superintendence of Mr. J. Shaw, general manager and engineer, to whom we are indebted and our thanks are tendered for the illustrations and particulars of this unusually interesting example of water power utilization for electric supply.

#### WIRELESS TELEGRAPHY.

#### The Guarini Automatic Repeater.

BY EMILE GUARINI-FORESIO.

[Translated for Electricity from a paper presented at a recent meeting of the Belgium Electric Association.]

As a complete innovation, wireless telegraphy after three years of incessant efforts by Marconi and other physicists of various countries is just entering the field of practical application.

Communications have lately been established in England by his method through a distance of about 140 kilometers, and there is a certainty that more perfect modifications will increase this working distance.

But there will always be limits in direct transmission as there are in ordinary telegraphy, or relays must be used to repeat the signals automatically, and transmit them with renewed energy to the next station.

We are now interested in solving this last problem by the invention of a repeater, which, for wireless telegraphy, subserves the same purpose as the relay in ordinary telegraphy.

Our apparatus is placed between extreme stations to receive the enfeebled radiations, and repeat them with the same periodicity, and with greater energy.

The mechanism and its functions are quite simple. The apparatus acts at first as a receiver, and secondly as an automatic transmitter, and forms at the same time a combination of these two elements. Again we find repeated the story of Columbus and the egg; it is all in knowing how, for naturally in providing a convenient number of repeaters between two stations, however far apart they may be, the problem of wireless telegraphy is solved.

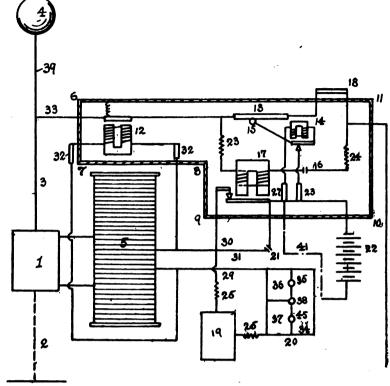

The principle of our repeater, that is, the combination of a receiver and a transmitter, is applicable to numerous other wireless telegraph systems, such as the luminous, and also sound waves, ultra-violet rays, etc. In this sense it has many useful applications, and above all others it is applicable to the Marconi system, and in this application it gives the best results.

Referring to Fig. 1, 1 is the oscillator with a ground connection below, and connected by conductor 3 to the aerial spherical conductor 4, or of any other conformation having great electrostatic capacity.

The Rhumkorf coil, 5, feeds the oscillator. Within a soft iron box, 6, 7, 8, 9, 10, 11, are enclosed an electromagnet, 12, which breaks the circuit in wire 3 and the sensitive tube, 13, each time the oscillator operates without interfering with it. The electric motor, 14, operates a small hammer, 15, which strikes against the

tube, 13, and is energized by a local battery 16; a relay, 17, and a needle galvanometer 18, shows when the apparatus is in use. Outside the metal box is a Morse instrument, 19; 20 is a three-way switch, 21 an operative key, and 22 is a source of electric energy; 23, 24, 25, 26, 27,

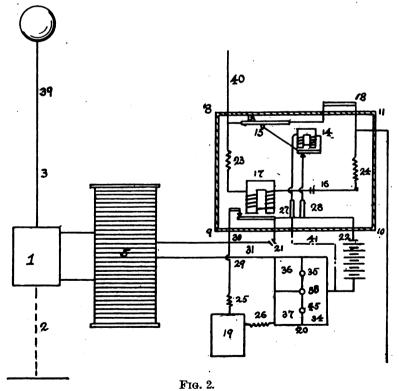

receiver, or as a relay. As a transmitter, the circuit containing the battery, 22, is closed by means of the key, 21, connecting the primary of the coil, 5. The secondary circuit, comprising the resistance, 32, electromagnet, 12, and the circuit of the motor, 14 (in this case when

F1G. 1.

28 and 32 are resistances. The conductor, 29, is connected by 30 with the conductor 31; to change the direction of the current passing through electromotor 14, we accomplished it by connecting 41 of the motor circuit to the

the connection indicated in 41 is employed the motor 14 is always in operation, and the small hammer is constantly striking the sensitive tube 13). In this instance the plate, 34, of the switch is connected with the plate, 36, by plac-

conductor coming from the battery to the switch 20,

In place of one vertical bar we can use two; one, 39, in communication with the oscillator 1, and the other, 40, connected with coherer 13, and thus suppress the electromagnet, 12 (Fig. 2).

The repeater can operate as a transmitter,

ing the contact key in the hole, 35. We see from these connections that immediately after the coherer has operated, that it is always in a sensitive condition, and resumes that condition automatically through the action of the hammer, 15.

When the apparatus is used as a receiver, the electric waves arrive through the sphere 4, the

bar 39, and the wire 33, and acts on the sensitive tube 13, in identically the same way as in the Marconi receiver. It is then necessary to connect the two plates, 34 and 37, by placing the connecting plug in the hole 45.

: As a repeater the plate 34 and 36 are connected. The distant station sends out a wave of greater or less duration, and when this wave acts on the sensitive tube at an intermediate station the relay, 17, energizes its armature, and closes the circuit of the oscillator coil, and at the same time that the bar 39 is traversed by an intense oscillating current, the hammer 15 strikes the sensitive tube 13, and consequently makes it ready to receive the next wave which arrives. If at that instant the transmitter of the distant station ceases to act, the repeater will then have sent out a current of short duration, which will be registered at the distant receiving station by the Morse apparatus as a dot. But if the wave from the transmitting station continues, the sensitive tube will operate again, which at the distant receiving station will be registered as another dot. We thus see that the repeater sends out a succession of electric impulses whose number depends on the duration of the wave from the transmitting 'station. These effects of the current are registered as a succession of points at the receiving station as in the Marconi apparatus, following the frequency with which they succeed each other, and reproducing in the Morse apparatus lines of variable lengths. Again, if the conductor 34 is connected to 37, and at the same time with conductor 36 by means of the .plug placed in the hole 38, this simple arrangement permits of the registration of transmitted or repeated signals. The electromagnet, the relays and the coherer are enclosed in a soft iron box to prevent these parts. from being influenced by the magnetic field of the induction coil, which is necessarily near the other parts to secure the best results.

The repeater which we have just described, whatever its arrangement, is admirably designed as a repeater for moving stations, such as the establishment of communication between ships, in which one of them serves as an intermediate station.

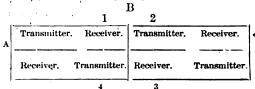

But the arrangements as represented in Figs. 1 and 2 are not adapted to solve the problem of wireless telegraphy at any distance, for let us suppose we have two outer stations, A and B, and two relay stations, 1 and 2, as shown below:

And again let us suppose that the station A is the one which is sending, and B is the receiving station. The waves sent from station A influence the coherer of the intermediate station 1, and the latter in its turn acts on the coherer of the intermediate station 2, and at the same time that the waves sent out from station 2 actuate the coherer of the last station B, it will also influence the coherer of the intermediate station 1, perhaps at the same time that station A is sending out other signals, and the result would be confusion. Theoretically with the arrangement shown in Figs. 1 and 2 a single intermediate station is allowable, but practically we can use an indefinite number, especially if we consider these repeaters, in the various stations, as acting almost instantaneously.

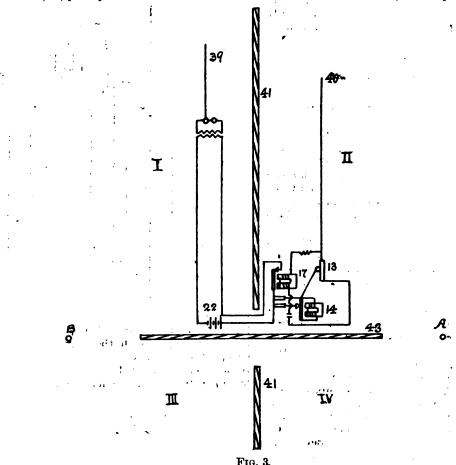

We may then arrange an apparatus as shown in Fig. 3; we separate the receiver from the transmitter by a metallic partition, 41; the receiver should be on the side toward the distant transmitting station, and the transmitter on the side next to the distant receiving station.

The partition might be of any substance which will arrest the electric radiation, prevent the radiation of the intermediate transmitting station from returning to the extreme distant transmitter, or to that of a preceding intermediate station, in those instances where there are several and at the same time, when necessary, to prevent the receiver of an intermediate station, wherever it may be, from being influenced by these same radiations. The partition, 41, perhaps could be a reflector which

the two extreme stations, it becomes possible to transmit in opposite directions at the s me time by the following diagram:

A and C are the two distant stations, and B is an intermediate one. The signals sent by the transmitter of station  $\Lambda$ , and repeated by the

would reflect the radiation from the repeating transmitter to the next following receiving station.

The arrangement of parts shown in I, II (Fig. 3), are such as to receive from A, and transmit the electric radiations to B; in order to receive from B and transmit to A, we would employ a second apparatus, entirely distinct from the first, whose parts as mentioned would likewise be separated by a partition 41; in this second apparatus the receiver would be in III and the transmitter in IV, and the two combinations would be separated by another partition, 43, which would permit the operation of any one of the two combinations, that in I and II, or that in III and IV, according to which station A or B is transmitting.

It is immaterial whether we employ partitions, or reflectors, a single combination can serve for communication in either case by using a switch which will place the oscillator in circuit with the wire in I, or in IV, according to which station A or B is transmitting but in this case the one who does the switching should know which station is sending; there being a single Branly tube, each time an intermediate station is in operation, the sending station should know which is transmitting, and this would not be practical.

By metallic partitions, or analogous means separating the sender and the the receiver, also relay 1-2 of station B, are registere l by the receiver of station C at the same time that the signals sent by the transmitter of station C are relayed by the relay 3-4 of station B, or registered by the receiver of station A.

The results secured by the arrangement of parts shown in Fig. 1 have demonstrated that the interrupter, 12, requires a certain amount of attention, which could not be given in case the apparatus is placed on buoys anchored in mid ocean for communication between islands or distant continents; then we must employ an arrangement shown in Fig. 2 where the electromagnet, 12, which has no other functions than that of feeding the single receiving bar, 39, and which suppresses the transmission of signals.

To make the apparatus wholly automatic (without need of personal attention) it is preferable to use dry batteries, or other kinds that will last a long time without being renewed, and likewise for the same reason it is preferable to use the Blondel coherer, which is the one having the longest life and is recuperative.

It is generally believed by wireless telegraph electricians that when these radiations encounter a metallic surface they go around instead of being arrested; this belief is caused by the fact that sometimes when a coherer is placed behind a metallic surface it will still operate.

We have always held and now maintain that a metallic surface is an unsurmountable obstacle to electric radiations; although we admit the case just cited, and to our mind this is the explanation.

Let us consider Fig. 3. When the oscillator operates, the wire 39 causes induced currents in the metallic surface, 41; the conductor 41 then becomes a new center of radiation, but of a minimum intensity, from the induced current being less, or because part of the induced current is transformed into heat. Radiations from conductor 41 are too feeble, especially if we employ a metallic separation, but above all when this conductor is connected to earth to enable the current to return to station A or to a preceding intermediate station, should there be several. The coherer placed in II is then in use; then as to what follows we have explained does not prevent the action of our apparatus, because the same instant it operates it is decohered.

But there are instances, such as when we wish to transmit messages in opposite directions at the same time, when it is absolutely necessary that the receiver be not acted on by the transmitter of the same station. It is easy to obtain this result. All there remains to do is to separate these two pieces of apparatus by a plain metallic surface, and operate at right angles; in this case there are no radiations except upon the surface exposed to them as in the Hertz reflector.

Wireless telegraphy becomes then immediately practicable for all distances and under all conditions.

Thanks to this apparatus, it becomes henceforth possible to establish true lines of wireless telegraph "quick and sure."

Here are some of the immediate possible applications of the repeater: communication between islands, between distant continents, between large cities, between meteorological stations, communication between two trains in motion with a repeater placed in the railway stations, communication between railway stations, and also between fortified points along the sea coast.

We could establish telegraphic communication between London and New York, by placing a convenient number of repeaters on the Bermuda Islands, the Azores and upon buoys at sea, in Portugal, Spain, France, etc.

If we place repeaters with their spires in relatively vertical positions upon floating buoys anchored at convenient distances apart at sea, any vessel finding itself within working distance could communicate with any one on any subject it chooses. One vessel could telegraph to any other vessel at a great distance, which is within the range of the electric waves that can influence its coherer from one of these floating repeaters, and our system would be useful in securing help at sea when a ship is in danger.

Our apparatus can register the messages which it repeats, or transmits, and a ship which is too far away from shore to receive messages, or too far away from a vessel in distress, could receive messages by going to the floating recording instrument to read them.

There is no fear of a confusion of signals, if the apparatus is used as we have proposed, for in the circuit of the coherer (which is always sensitive whether it acts as a transmitter, receiver or as a repeater) there is an indicator which tells by its needle if the apparatus is being used. The deviations of the needle will indicate if the line is in use, and we have only to wait until the needle is at rest to know when to send a message.

The apparatus will find immediate use in new countries where telegraph lines do not exist, and an expedition to unexplored regions could keep in touch with the point of departure.

Finally, as M. Ernest Gerard, chief engineer to the Minister of Posts and Telegraphs, has remarked in finishing an address on this sub-ect, before the Belgium Electric Association, "The applications are of such a nature, and of such great importance that the present condition of things would be wholly changed."

#### OUR PARIS LETTER.

(Special Correspondence of Electricity.)

# The Electric Railroad Between Fayet and Chamouni.

The project of building an electric railroad to the top of Mont Blanc, which is intended finally to connect with the road from Fayet to Chamouni, has already been mentioned in ELECTRICITY. We now take up this subject because this road is very interesting, viewed from the construction standpoint. It is in fact the first time that a great French railroad company has attempted to build and operate an electric narrow-gauge railroad. It is being undertaken by the Paris-Lyons & Mediterranean Railway Company. The road at present terminates atiMont Blanc, with the intention of extending to the summit later on. The present terminal station will be at Fayet Saint Gervais (580 meters, high) and the track will be further extented to Chamouni which is 1,007 meters above the sea level. The power will be furnished by the Arve River from four different water power plants constructed Letween Saint Gervais and Chamouni. The current will be carried on a lateral rail and will be taken up by contact brushes, and every car will be furnished with a motor. On the steep grades a central rail will be added which will ne used in connection with a supplementary brake. One of the power plants has been con.pleted at Chedde, about three miles from the Fayet station. The width of the track is one meter throughout the entire line. From the starting point the track commences to rise gradually and terminates at Chedde, at an elevation of about 597 meters. Passing this station there is a grade of 2 per cent., followed by another one of 9 per cent, for a distance of two kilometers; this last grade is the steepest one as none of the others exceed 7 to 8 per cent.

# The Electric Railroau from Pierrefitte to Canterets.

Little information is at present to be obtained from this road as the track is not yet entirely completed. This is a connecting road in the Pyrenees, between the main line of the Southern Railway and the watering place of Cauterets, so famous on account of its sulphurous water. From present information the detail in regard to cars and the electric plants will be about the same as in the Chamouni construction. This line has been in operation about two months, the track is 11 kilometers long and rises to a height of 1,000 meters, and the gauge is one meter. The ascents are made by ordinary traction, but all the cars are furnished with motors. There are 25 cars with 52 seats each, with a passage way through the penter, while two compartments at each and give access to the platforms. Each car is

mounted on four bogie trucks; each one of the latter is operated by two motors of 30 amperes and 600 volts, giving an 18-kilowatt capacity, or 25 horse-nower at 450 revolutions per minute. There are three styles of brakes in use—a hand brake, by means of which shoes are applied to all of the eight wheels; a flat brake of tempered steel which operates by friction on the rails. while thirdly, the motors can be made to run as generators. The motive power is supplied from a sluice-way from the Cauterets torrent, which forms a series of water-falls, and after a subterranean run of 800 meters arrives at two coupled steel-plate pipes of 65 cm. diameter, which carry the water under a 69 meter head, giving 1,300 hp, to the main station erected at Calypso, about midway between Pierrefitte and Cauterets. This plant has four waterwheels of 300 hp. each, operating 8 dynamos. Another small wheel operates the exciters. The current is generated at a tension of 750 volts and is conducted by overhead wires to the trolley cars. All stations are illuminated by electric lights and a telephone line connects all the stopping places along the entire route.

# The Mountain Electric Railroad up Mount Dore.

If we add the description of the interesting construction recently completed up . Moun Dore by Messrs. Guitton & Co., the French rep resentatives of the Oerlikon Company of Zurich, Switzerland, we think we have reviewed all the latest mountain railways operated by electric power in France. The power for this line is secured from the Dordogne River and transmitted by the three-phase system. This line allows suffering humanity to enjoy a mountain-air cure. It connects the city with an elevated plain having a forest of fir-trees. The river can supply 600 liters of water per second, a gate and a sluice-way conducts the water to the plant, which is situated at a distance of 740 meters, where the fall attains a height of 31.50 meters. The plant has an underground passage for the pipes, and a water reservoir: the ground floor contains the water-wheels and their accessories. The turbine is furnished by the Lremer Negret Company of Grenoble, and is of the helico-centri-. petal type of horizontal style, and gives 180 hp. at 500 revolutions per minute, driving directly. by means of elastic coupling, a three-phase current alternator with a rotary iron field of the Oerlikon system. At a speed of 500 revolutions the alternator produces 138 kilowatts at 2,000 volts per phase, corresponding to a total of 3,600 volts at a frequency of 50 periods; per second. Excitation is furnished by a small bipolar dynamo of 600 watts at 50 volts, mounted directly on the alternator shaft. To avoid too much variation of power, which varies from 0 to 80 hp., a balance wheel of 1,800 kilograms is placed between the alternator and the turbine. An automatic speed ! regulator operating a cylindrical slide-valve is also attached to the apparatus. On the switchboard there is a transformer for the purpose of reducing the potential in order to permit the reading of the voltmeter and to secure station; illumination. There are also voltmeters and amperemeters of high tension and a bipolar switch. The three outgoing lines are fitted with condensers. There are three bare wires in the transmission line: they are of silicious bronze of 4 mm. diameter resting on double bell china insulators and wooden posts. The electric energy is sent to a sub-station on the summit, where an electric motor is placed to op-

erate the cable-driving drum. This motor is of the three-phase synchronous current type with a rotary field of 12 poles and 50 alternations per second and makes 490 revolutions per minute. its power being equal to 90 hp. The power is transmitted to the motor drum by means of two shafts carrying pinions and the necessary attachments. The reversing is done by commutating the current in two of the three windings of the magnet. The cable pulling the cars which winds off on pulleys operated by the moter drum has a diameter of 33 mm., and weighs 3.9 kilograms per linear meter. The track gauge is one meter, and is single track, with the exception of a run of 38 meters at the car crossings. These cars weigh 5,035 kilograms, and are attached to both ends of the cable. This is the first electric cable railroad constructed in France.

#### LEGAL NOTES.

Answer was made recently to Mrs. Mary T. Leiter, who is seeking to have a receiver appointed for the Metropolitan Street Railway Company of Washington, D. C. Mrs. Leiter said in her bill of complaint that the recent street railway consolidation deal, by which the Metropolitan lines became practically one with several suburban roads under the name of the "Washington Traction & Electrical Company," has detracted from the value of her 2,700 shares of the Metropolitan Company, as well as from the \$27,000 worth of certificates of indebtedness which she holds from that company. She made the directors of the new company defendants in the suit, charging them with losing sight of the interests of the Metropolitan Company in their desire to advance the interests of the new concern. The reply, besides denying many of the minor allereply, besides denying many of the minor ane-gations of Mrs. Leiter, recites that at the time the consolidation was affected an offer was made to buy Mrs. Leiter's stock for \$230 a share, which, it is claimed, was the highest price the stock had ever sold for. This offer was refused, Mrs. Leiter claiming \$400. The reply avers that Mrs. Leiter brought the suit simply to compel the purchase of her shares at an exorbitant price.

Ruling was lately made in the United States Circuit Court of Appeals of Chicago, Ill., by Judges Jenkins, Wood and Bunn, that a creditor who within four months of his debtors' bankruptcy has innocently received a payment on his debt cannot be permitted to prove his debt in the bankruptcy proceedings nor receive from the estate of the bankrupt a dividend thereon without surrendering the preference allowed. The ruling is said to establish a new precedent for creditors under the National bankruptcy law. The decision was handed down in the appeal of the Columbus Electric Company against Charles H. Worden, trustee of the Fort Wayne Electric Corporation.

The Van Choate Electric Company, a Maine corporation, with principal offices in Boston, Mass., and a plant at Foxboro, was placed in the hands of three receivers, E. R. Price, F. W. Hartwell and T. P. Blake, by Judge Colt in the U. S. Circuit Court a short time ago. The company has a capitalization of \$6,000,000. The shareholders are numerous and the stock is frequently quoted in the financial world.

#### The New York Electrical Society-203d Meeting.

The 203d meeting of the New York Electrical Society will be held at the College of the City of New York, Twenty-third street and Lexington avenue, on March 2 at 8 P. M. A. R. Ledoux, M.S., Ph. D., will lecture on "Copper from the Ore to the Wire Bar."

#### PERSONAL MENTION.

Mr. C. L. Edgar, vice-president of the Edison Electric Illuminating Company of Boston, Mass., has been elevated to the presidency, succeeding the late Jacob C. Rogers. Director Walter C. Baylies was elected vice-president to succeed Mr. Edgar.

Mr. Howard C. Lewis, of Schenectady, N. Y., was recently elected president of the People's Electric Light Company, to succeed the late S. Dana Greene.

Mr. E. H. Rollins, who has been superintendent of the Central Massachusetts Electric Company of Palmer since its incorporation, will remove to Hartford, Conn., about March 1, where he will be engaged in the electrical business.

Mr. Charles Kent, of Ogdensburg, N. Y., has recently een elected manager and superintendent of the Canton (N. Y.) Electric Light & Power Company.

Mr. J. H. Witbeck was recently elected president and treasurer of the Chicago General Railway Company.

#### INCORPORATIONS.

The Consolidated Electric Company, Camden, N. J.- to do a general electrical business. Capital stock, \$10,000.

The Bunnell Telegraphic & Electrical Company, New York City-to manufacture telegraphic supplies. Capital stock, \$200,000. Directors: Mary T. Bunnell and Dewitt C. Bunnell, Brooklyn; F. R. Green, Fredonia; Charles E. Merritt and Albert J. Wise, New York City,

The Columbus, London & Springfield Railway Company, Columbus, O.-to operate a passenger and freight electric road, also a telegraphic service, and to furnish electricity for power, lighting and heating to the towns along the route. Capital stock, \$1,000,000. Incorporators: John G. Webb, John M. Good, Hart F. Fisher, Emmet Tompkins and Fletcher S. Penfield.

The Guernsey Incandescent Light Company, St. Louis, Mo. -to do a general electrical business. Capital stock, \$100,000. Shareholders: David W. Guernsey, Sim T. Price, Joseph G. Branch and Charles W. Barstow, Jr.

The Lockport and Newfane Power & Supply Company, Albany, N. Y.- to develop and employ hydraulic and electrical power and supply it to the citizens of Niagara County. Capital stock, \$500,000. Incorporators: Willard T. Ransom, Henry I. Pierce, John A. Merritt and Harry L. Ransom.

The Kinston Electric Light Company, Kinston, N. C .-- to supply electric light and power. Capital stock, \$10,000. Incorporators: B. W. Cannady, S. H. Abbott, J. W. Granger. L. Harvey, all of Kinston.

The Athena Light & Power Company, Athena, Ore,-to operate an electric light plant. Capital stock, \$30,000. Incorporators: T. J. Kirk, C. A. Barrett, Joseph France, H. C. Adams and J. W. Smith.

The Municipal Light, Heat & Power Company, Hoboken, N. J. - to furnish electricity, heat and compressed air. Capital stock, \$300,000. Incorporators: J. Bruning, of Hoboken; P. H. Wallenstein, J. H. Walsh, both of New York.

#### COMMERCIAL PARAGRAPHS.

The Emerson Electric Manufacturing Company of St. Louis, Mo., desires to announce that it has opened a New York office at 136 Liberty street, which is in charge of an officer of the company and where a large stock of regular motors will be carried. This will permit of the trade in this vicinity being supplied with a minimum amount of delay.

The Cling-Surface Mfg. Company of Buffalo N. Y., has just been incorporated under the laws of the State of New York, retaining the same name as heretofore, with Albert B. Young, as president and general manager, and Wm. D. Young, vice-president and secretary. The past year has been the most prosperous in the history of the company and the demand for Cling-Surface they report to be increasing steadily. They have now three branches, one each in Boston, New York and Chicago, with others just opening in St. Louis and New Orleans, while the well known importing house of W. J. Moxham & Co. of Sidney, Australia, has ordered a large shipment of Cling-Surface with the exclusive right to handle it in Australia.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FORFIGN PATENTS. at 502 and 504 Broadway (Room 1204), New York City also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as print d publications containing all informaregarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application

by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon pay-

ment of ten cents. When ordering give name, date and tite of invention wanted.

strong and William D. Neel, Chicago, Ill. Filed March 12, 1848.

642,674. Electrical Recording Apparatus. Hugh L. Callendar, Montreal, Canada. Filed Feb. 14, 1858.

642,738. Electric Cable for High-Tension Currents. Chas. Borel, Lyons, Frames. Filed Feb. 13, 1888.

642,738. Commutator for Electric Motors or Generators. Sydney Evershed, London, England, assignor to himself and the Evershed & Vignoles, Limited, same place. Filed Sept. 15, 1859.

642,849. Electrically Igniting Lamps and Liquid-Fuel-Burning Devices. Robert Schreiber, Berlin, Germany. Filed July 30, 1838.

642,849. Railway Signal Mechanism. Samuel L. Neely, Pierron, Ill. Filed May 10, 1899.

642,849. Electrical Massage Instrument. Edmund T. Otto, Jersey City, N. J., assignor to Whitall, Tatum & Co.: New York City. Filed Nov. 27, 1899.

642,859. System of Electrical Distribution. Henry P. White, Kalamazoo; Mich., assignor of three-fourths to Charles D. Fuller, same place. Filed Sept. 26, 1898.

642,933. Electric-Alarm Try-Cock. Stephen M. Mathews, Toronto, Canada. Filed April 41, 1899.

642,933. Electricity Separation of Zine from Zine Oxid, Oscar J. Steinhart, Julius L. F. Vogel, and Henry E. Fry, London. England: said Steinhart and Vogel assignors said Fry. Filed April 10,1849.

642,938. Electric Battery, Henry Blumenberg, Jr., and Frederick C. Overbury, New York City. Filed March 27, 1899.

27, 1899. 643,002. Electric Ignit r for Explosive-Engines. Willis J. Perkins and Carl H. Blomstrom, Grand Rapids, Mich.; said Blomstrom assignor to said Perkins. Filed Dec. 9, 1897.

1897.
643,042. Process of Producing Material Suitable for Electric Insulation or other Purposes. Arthur Smith, London, England. Filed Aug. 14, 188.9.
643-048. Utilization of Hertzian or Similar Radiations and Apparatus Therefor. London, H. Walter, London, England. Filed March 6, 1899.

### GENERAL NEWS.

#### What is Going On in the Electrical World.

#### LIGHTING.

Ada, Minn.—Bid: will be received until March 1 for the erection of a new electric light plant in this village. Address F. M. Carkins.

Alcester, S D - The citizens of this place are agi ating the question of building an electric light plant

Auburn, Neb.—The necessity of an electric light plant in this city is being agicated by a number of citi-

Beaver Dam, Wis.-An electric light plant will soon be built here.

Beeville, Tex -An electric light plant will soon be erected here.

Bloomington, Ill.-This city is about to enlarge and rebund its electric light plant.

Colinwood, O.—The village council has passed a resolution approving the specifications of Engineer Roberts on the electric light poant.

Concord, Mich.—W. H. Magel has been granted a franchise by this village for the construction of an electric lighting plant within this place.

Dalton, Ga.—This city contemplates arranging for the construction of an electric right plant, and has ap-pointed a committee to obtain information. Address J. M. Sanders, chairman of committee.

Detroit, Mich.—The common council committee on public buildings has been considering the proposition to secure an additional appropriation to provide for lighting the new G. A. R. memorial hall with electricity.

Hagerstown, Md.—This city will issue \$69,000 in bonds for a municipal electric light plant.

La Crosse, Wis.—The Burlington Boad is considering place of installing an electric lighting plant at Grand Cross ng.

Lixington, Gs.—A company headed by T. G. Lester reposes to erect an electric lighting plant here of 250 lights.

Manville, R. I.-An electric light plant will soon be erected here.

Montesano, Wash. -The council has taken prelimi-1..ry steps looking toward the better lighting of the cry, which has been practically without lighting since the burning of the electric light plant.

New Haven, Conn.—The Consolidated Railroad Company expects to change its lighting system from gas to electricity in its office building in this city.

New Lindon, Conn.—Bids are asked for until March 2 for runnishing the materials for erecting an electric light plant. Addresss Major S. S. Leach, U. S. Engi-

New Rochelle, N. Y.—The people of this place are serious y considering the question of municipal ownership of an electric light plant.

Pelhem, Ga.—The Pelhem Manufacturing Company will soon install an electric lighting plant.

Pittsburg, Pa.—A new electric light plant is to installed in the Homeopathic Hospital in this city.

Portsmouth, N. H.—The question of building a municipal electric light plant is being discussed here.

Richmond, Ind.—The H. I. Yaryan Steam Heating Company of Toledo has presented a proposition to the city council to put in both heating and electric lighting plants for Richmond, when the present light contract expires.

Richmond, Va.-It is reported that a movement is on foot to have an electric lighting system put in the City Hall. A committee has been appointed to inquire into the cost of getting the necessary machinery.

Rockville, Ind.—The citizens of this place will try the experiment of municipal ownership of the electric light plant, the town council having purchased the local plant will enlarge it so as to include waterworks.

Rush City, Minn.—The Rush City electric light plant was des royed by fire last week.

Saginaw, Mich.—The electors of this city will vote April on the proposition to issue bonds for \$75,000 to build an electric lighting plant.

Skaneateles, N. Y.—F. L. Rogers of Syracuse has prepared an estimate for an electric light plant to cost about \$13,000.

Snow Hill, Md.—The question of building a municipal electric lighting plant is being discussed by the citiz us of this place.

South Norwalk, Conn.—The South Norwalk electric light commissioners have been getting out plans for an in-rease to their commercial plant.

8:. Cloud, Minn.-The Great Northern contemplates the erection of a new electric building and plant at their car shops in this city.

St. Michael's, Md.—The citizens have voted to issue \$12 000 in bonds for building the electric light and waterworks plant.

Wahoo, Neb.—The citizens of this place are agitating the question of electric lighting.

Winona, Miss.—Chas. Morser and J. C. Wadsworth of this place are prepared to receive estimates on an elec-tric light plant of 2,500 incandescent and 50 arc lamps.

#### STREET RAILWAYS.

Albany, Ind —The surveying has begun on the elec-ic line from this place to Buff on via Dunkirk and ennyille. The company at the head of the project is the Essern Railway Compacy, and work on its con-struction will begin in the near future.

Atlantic City, N. J.—A syndicate composed of Philadelphia capitalists is interested in the building and operating of a trolley line down the beach, which is to be a branch of the line that is to be built over the turnpike between Absecon and St mers Point.

Belchertown, Mass.—The citizens of this place are discussing the question of an electric road.

Detroit, Mich — Arrangements for the building and equipment of a new electric railroad were made the first of the month. The new road is to connect Grand R spids with Holland and the lake shore resorts in that vicinity and will be over 50 miles long. The projectors are B. S. Hanchett of Grand Rapids, F. C. Andrews, J. Winter and O. W. Lau of Detroit.

Elkton, Md -Those in authority at the Jacob Tome Institute have been considering plans for the building of a trolley road from Perryville to Port Deposit for the accommodation of the children who attend the Institute but live out of town.

Grand Haven, Mich.-The council has granted a franchise for the proposed G and Rapids, Grand Haven & Muskegon Electric Railway.

Indishapolis, Ind.—A movement is on foot to build an electric road from Madison to this city by way of Greensburg. C. H. Wilson, F. M. Thompson and N. Jackson of Versailles are interested in the project.

Iowa City, Ia.—Cons'derable interest is manifested here among business men and residents of the west portion of the county in the proposition of building an electric car line connecting the town of Williamsburg with this city.

Liberty, N. Y.—It is announced that a Philadelphia contractor will build the Liberty-Jefferson ville Electric road next spring.

Ligansport, Ind.—The Indianapolis & Logansport Traction Company contemplates the erection of an electric line from this city to Indianapolis. George J. Marott is president of the company.

Piedmont, W. Va.—J. W. Burchinal and J E. Hooton are trying to revive the project to build an electric railway from this place to Cumberland, a distance of 28 miles

Providence, R I.—It is reported that the Providence & Danielson Railway Company will complete, during the present year, an electric line between the two places for both passengers and freight.

Salem, Ind.—The new proposed electric railway, which is to extend from Seymour to Marengo, by way of this place, is meeting with approval throughout Jackson, Washing'on and Crawford Counties.

Sistersville, W. Va—The parties interested in the construction of an electric railway from this point to Middlebourne have secured the necessary capital, and it is said that work on the line will commence on April 1.

St. Louis, Mo.—A franchise to construct and operate an electric railway was granted last week to the St. Louis County Transit Company. G. P. Hofman is president of the company.

Tomahawk. Wis —W. H. Bradley, president of the Wisconsin Valley Advancement Association, has been in the East negotiating with capitalists and railroad prijectors, with a view of having work commenced on the new electric railway system connecting the cities and towns of the valley from Port Edwards on the south to Eagle River on the north, at the earliest date possible.

Washington, D C. -A corporation known as the East Washington & Benning Railway Company is authorized to construct and operate a single or double track railway on which electric cars are to be run from Northeast Washington to Benning.

Wartrace, Tenn —An electric road is soon to be built between here and Lynchburg. The proposed route will connect and run through the richest sections of Moore and Bedford counties.

Western Port, Md.—The original projectors of the proposed electric railway from Cumberland to this place are trying to revive the scheme, despite the fact that the Allegheny county commissioners have revoked the franchise.

#### MANUFACTURING, ETC.

Indianapolis, Ind.—The Indianapolis Street Railway Company is manufacturing summer cars, which will be built on a special design never seen in this country.

Muncie, Ind -W.C. Sumpson, local manager of the Mudme, and —w. C. Simpson, local manager of the Union Traction Company's street car system, has let the contract for thirteen new motor cars, at \$2.500 each, to the St. Louis Car Company. The contract stipulates that the cars shall be running on the Muncie streets by

Passaic, N. J —The New York Belting & Packing Company has ord red from the Sprague Electric Company a 75 kw. direct connected generator for its new factory in this city.

#### COMPANY MATTERS

Raltimore. Md.-It is reported that the Susquehanns Baltimore, Md.—It is reported that the surquenanna Power Company has the power to increase its capital stock to \$5,000,000. It has authority to manufacture and dispose of electricity. For several years the company has been at work on plans to dam the Susquenanna above tidewater, and to utilize the power to generate electricity to be distributed in this city, Philadelphia and adjacent towns.

Buffalo, N. Y.—General Manager U. L. Upson of the Buffalo, Hamburg & Aurora Electric Railway has contracted with the Nordberg Corliss Engine Company of Milwaukee for the construction of two big Nordberg-Corliss engines of 450 horse-power each.

Canton, O.—The shop of the Electric Cleanser Com-any was recently destroyed by fire, entailing a loss of

Evanston, Ill.—Arrangements have been made by the Evanston Electric Illuminating Company to re-model its power house, and to re-equip its plant with entirely new steam and electrical machinery. Evanston, Ill

Kennett Square, Pa.—The representative of a New York syndicate in the purchase of the Kennett Electric Light plant has purchased the electric plants at Coatesville and Oxford, and it is said the plants will be consolidated and that they will supply the current for an electric railway that is projected.

New Brunswick, N. J.—For the purpose of having under one management a trolley road from Philadelphia to Jersey City, a meeting of the three lines now covering most of that distance—the Brunswick | raction Company, the New York and Philadelphia Company and the New Brunswick City Railway—has been called for February 16, at New Brunswick, N. J.

New York.—The Sprague Electric Company has equipped one of the Old Dominion Line steamers with a quantity of Lundell faus mounted to run in an inverted position, the motors being attached to the celling.—The Safety Insulated Wire & Cable Company has purchased 12 acres of land with 400 feet of water front on the Kills, at Bayonne, N. J., and will soon move its plant to the new locality.

Norristown, Pa.—A trolley railway deal, which embraced the transfer of \$550,000 in property, was effected lately when the Schuylkill Valley Traction Company was sold to the United Power & Transportation Company.

Rahway, N. J. - It is announced that the Riker Electric Railway Syndicate has taken possession of the Rahway-Sawaren Electric Road, better known as the Union & Middlesex Traction Company. tric Railw Rahway-S

Union & Middlesex Traction Company.

Reading, Pa.—The Arrowsmith Electric Company recently purchased the entire stock of the Reading Electrical Manufacturing Company.—The United Power & Traction Company will erect new shops here, including brass foundry and machine plant.

Waverly, N. J.—The E. S. Ward & Co. has equipped its new factory in this place with the Lundell apparatus, having ordered from the Sprague Electric Company one 25 kw. and one 75 kw. generator, belted type, of 250 volts, and fifteen motors ranging from 2 to 21 hp.

#### POWER AND TRANSMISSION PLANTS.

• Clevelard. O.—Geo. E. Collings, president of the Clevelard Faucet Company, is at the head of a movement to erect a large power house to furnish the motive ard lighting power for the entire city. He wants to erect a plant at Massillon and there generate electric power which he would transmit to this city.

Snowville, Va.—The Virginia Iron, Coal & Coke Company have taken an option on the land of Mrs L zzie Hall, for the purpose of utilizing the water power for an electric plant. By cutting a tunnel less than a half mile long they will get the fall of the river for seven miles, which will give one of the most valuable water powers in the country, as the river has a fall of from nine to eleven feet to the mile at this point.

#### MINES, ETC.

Idaho, Springs, Col.—Manager L. Hanchett of the Lamartine mine says that if he can make satisfactory arrangements with the electric lighting company of Georgetown he will build a line to the Lamartine mine and change from steam to electricity the operation of the compressors and hoists.

#### AUTOMOBILES.

Atlantic City. N. J -The Oceanic Automobile Com-Attantic City. N. 3.—The Oceanic Automobile Company has been incorporated with a capital stock of \$470,000 by New York, Philadelphia and Atlantic City capitalists. The company will begin operations here June 1. Ten of the latest automobiles have been ordered, and will be delivered in May. Buses, similar to those now used on Fifth avenue, New York, will be run on all the principal streets between hotels, railway stations, rasidences and the beach with no extra stations, residences and the beach, with no extra charge for transfers.

New Haven, Conn.—The first automobile put on t'streets by the New Haven Electric Cab Comparrived a few days ago, and Messrs. Hart and Wells of the Cab Company have used the vehicle on the principal streets of the city. The suto is a small road wagon and will be used as a private carriage by the two gintlemen mentioned. Part of the state of

# THE TELEPHONE WORLD.

#### The Largest Switchboard.

The following communication will undoubtedly interest telephone readers:

New York, Feb. 8, 1900.

ditor Electricity.

Siz: In your issue of February 7, page 76 of ELECTRICITY, ear the bottom of the first column, you have a reference to he Kinloch Telephone Company of St. Louis, Mo., and the ast sentence reads as follows:

"The company now has over 6,000 subscribers, and the largest independent switchboard in the world in their exchange."

It might be of interest to your subscribers to state that this is wholly untrue, as there are a number of switchboards in Europe larger than 6,000, notably one installed in Copenhagen, Denmark, which has 10,000 subscribers. We could mention a number of other exchanges having more than 6,000 subscribers, and if you care for this information we will take pleasure in giving it to you. Very truly yours,

ERICSSON TELEPHONE COMPANY.

#### Future Telephone Development.

"The future development of the telephone in the United States," said President Charles J. Glidden of the Erie Telephone System, to a representative of the Milwaukee "Sentinel," "can be computed based upon the plans adopted by the management of the Erie system in some of the leading cities of the country. Exchange buildings are now being erected to provide for 80,000 subscribers at Cleveland, 25,000 each at Detroit and Milwaukee, 20,000 each at Minneapolis and St. Paul. When the above growth is attained the development will not exceed that of to-day in Stockholm and exceeds by only 2 per cent. of the population of the present development at San Francisco. The development predicted would mean 150,000 subscribers for Chicago and 200,000 for Greater New York, and all subscribers must be connected with one general exchange and long distance system. At rate of increase made by the Erie system in 1899 the development above predicted will be reached by the close of 1905."

The Mississippi Valley Telephone Company, according to a Minneapolis, Minn., paper, recently made a return to the State treasurer on the gross earnings tax of the company. The year's earnings amounted to 10 cents, while the expenses of construction were \$300,000. In a letter which accompanied the statement, regret was expressed that the company had not earned more, not because of its anxiety to swell the State's finances, but because of its heavy deficit. It was explained that the 10 cents had been received from a member of the Forty-fifth regiment, who had used one of the company's telephones last fall and insisted on paying for the service. The dime is being treasured as a souvenir and will be framed by the company as its first earnings. As the deposition and revenue stamp would take all the company's earnings, it asks that the matter be allowed to go over until next year, when a better showing is anticipated.

At a recent mass meeting of the stockholders of the Kalamazoo Mutual Telephone Company, held in Kalamazoo, Mich., it was unanimously decided that they would not dispose of their property to the Bell interests, but on the contrary, raised additional money to make extensions to their property, and at a meeting of different independent companies, held immediately afterward, it was decided to extend the toll lines over the entire State.

The Citizens' Telephone Company of Terre Haute, Ind., has been reorganized. W. W. Coit, who is an organizer of independent telephone companies, will take active charge of the movement to establish a local exchange. The company has an old franchise in Terre Haute and owns some miles of a long distance line connecting with exchanges in Western Indiana and Eastern Illinois. It has never attempted to build a local exchange. It is said that the rates for business houses will be \$30 and for residences \$18 a year.

The Pittsburg & Allegheny Telephone Company, a branch of the United Telephone & Telegraph Company, which is instituting general competition against the Bell monopoly in and around Pittsburg, Pa., will begin to operate a telephone system in Allegheny County about April 1. Underground wires are being laid. The new company will begin with 5,000 subscribers.

The Richmond (Ind.) Home Telephone Company has now been in business for a year and is, according to an Indianapolis paper, making a great success. The company has over 1,000 subscribers and in addition to the local lines has built sixty-five miles of toll lines, reaching nearly all the neighboring towns. The work of building toll lines is still in progress. The company co-operates with the New Long Distance Company of Indianapolis.

#### The Situation in Detroit.

We appear to be getting at the milk in the telephone cocoanut, or, more exactly, the system by which the cocoanut, otherwise the subscriber, is to be milked, says the De troit, Mich., "News." Ever since the purchase of the independent lines by the Bell Company transpired, the managers of the latter and their associates of the former Detroit Company have made it their special daily task to impress upon the public mind the fact that the purchase, consolidation or combine did not forecast any increase of rates. This was the continuous burden of their song until letely, when an announcement of exactly opposite import was made by one of the prominent officers of the Bell Company, and confirmed by official action taken in connection with canvassing the city list of subscribers for contracts which call for a new and improved telephone instrument, at a rate almost 200 per cent. greater than that now charged for residence 'phones.

The pith and point of the whole busin as is to be found not in the fact that subscribers are to be asked to contract for the new instruments or in the company's strong recommendation of the latter, but in the accompanying announcement concerning the new switchboard and new system of service which the Bell concern is about to install. We are told, blandly and courteously, that the Blake instruments now in use will not work so well in connection with these greatly improved devices. Subscribers are perfectly at liberty to retain their present instruments, but, owing to the incompatibility mentioned, the company can not guarantee that those insisting upon such retention will get as good service as they have received in the past.

In other words, it is proposed to freeze out the \$24 a year subscribers by subjecting them to the annoyances and losses incident to an inferior and unsatisfactory service, thus forcing them to pay the higher price if they desire adequate and business-like attention to their needs. It is a lovely proposition, advanced in so sweet and ingenious a manner that its full force doesn't strike you at the first presentation.

Whether the company has not substantially and legally contracted to maintain its present service at the standard already established is a question which it would be well worth while to submit to the courts.

#### Free Telephones.

The New England Telephone & Telegraph Company has inaugurated a campaign of telephone education in Newburyport, Mass. They practically propose to put a long distance telephone into the home of any resident free of charge for four months; at the end of that time, if the party decides he does not wish to continue its use and does not find it a matter of great convenience, the company will remove the instrument without cost to the party who has had free use of it for four months. The instruments to be used are the regular long distance telephones, entitled to unlimited local service and subject to the same conditions as those now in use by business houses.

An important opinion, declaring that the law of Congress, fixing the rates for telephone service in Washington. D. C., is unconstitutional was delivered on the 5th inst. by Justice Barnard in Equity Court No. 2, of the District of Columbia. Congress, in June, 1898, fixed the maximum rate for tele phone service in Washington at \$50 a year, which is higher than the rate charged in many other cities. The telephone company, which has a monopoly in Washington, and which then charged \$145 a year for unlimited service, refused to obey the law. This brought the matter into the courts, and the consequent decision of Justice Barnard that the law is unconstitutional. "By reason of the fact that the rates fixed are unreasonably low for the service and supplies to which it must be considered they refer." Great disappointment is expressed by citizens over this decision, though it does not settle the case. An appeal will be made to a higher

At a meeting of the Newark Telephone Company in Newark, N. J., on the 5th inst., the following officers were elected: President, John M. Gwinnell; treasurer, Charles B. Smith; secretary, A. Norton Taylor; directors: John M. Gwinnell, Clement I. Walker, H. M. Cross, Edward W. Jones, A. L. Angle, James B. Curtis, Henry C. Vance, Augustus Woodruff, A. W. Deas, Caleb H. Barney and Charles B. Smith. There were 17,368 out of 30,000 shares of stock voted, of which 14,671 was what is known as Nevins stock because it is part of the controlling interest, which was recently sold to New York men by Thomas Nevins, of Orange. There is much dissatisfaction among the smaller stock owners at the sale of the controlling interest to outsiders.

The New State Telephone Company is building a new State line between Detroit and Ann Arbor, Mich. Work of construction was begun recently and has progressed as far as Dearborn. The road will be forty miles long, and is intended solely for the relief of the line to Jackson and Kalamazoo.

#### An Independent Company for Pennsylvania.

The Telephone, Telegraph & Cable Company of Pennsylvania was chartered in Harrisburg, Pa., a few days ago. The capital stock of the company is \$25,000, divided into 500 shares of \$50 each. The incorporators are Jeremiah J. Sullivan. Charles M. Swain, Charles A. Porter, Joseph B. McCall and William McLean, Jr., all of Philadelphia.

Mr. Sullivan is reported as saying that no organization had as yet been effected under the charter. The company expects to do a general telephone business throughout the State of Pennsylvania and has authority to connect with like organizations in New York, New Jersey, Delaware, Maryland and Ohio. In the larger cities, in towns where there are at present no telephone systems independent of the Bell Company, local systems would be probably organized under nuthority of the charter. Mr. Sullivan anticipated no serious difficulty in acco-nolishing this. In nearly every large town throughout the State independent telephone companies in successful operation would be connected with through lines built under the new company's charter, such beal commanies being operated through contract relations or by ownership of stock. The company would have contract relations with the Telephona, Telegraph & Cable Company of America.

#### Telephones in Japan.

A dispatch from Seattle, Wash., to the "Globe-Democrat" of St. Louis, Mo., states that the steamship Rio Jun Maru brings news from Yokohama, to the effect that the telephone system in Impantische has a maidly extended and perfected. The Ministra of Commingation has a maidly announced the opening of the high lines between Yokohama and Kobe, and between Yokohama and Osaka. The rate is 75 °8. A reduction from 25 cts, to 20 cts, is announced on the line between Yokohama and Tokio.

The plans of the recently incorporated Interstate Telephone & Telegraph Company, of which former Senator C. W. Kline, of Pennsylvania, is president and Alvin Markle and Charles Mans, Hazleton, Pa., directors, have been made public. The object of the new company, which is capitalized at \$2,000,000, is to establish a long-distance telephone service in Pennsylvania, Delaware, Maryland and New Jersey by connecting all the independent telephone systems of these States.

The Federal Telephone Company was granted rights to erect its lines in Bellevue, Pa., at a recent meeting of the borough council. The rate for business telephones is to be \$24 and for residences \$18, and the borough is to get three telephones free of charge.

The Minnesota & Dakota Telephone Company was incorporated in North Dakota with a capital stock of \$225,000. It is understood that the company will have its headquarters in Minneapolis, Minn., and will build west via Brainerd to Fargo.

The Georgia Telephone, Company of Savannah, Ga., is rapidly getting in share to furnish service to its subscribers. It is the intention of the company to make use of metallic circuits exclusively, and party lines will be conspicuous by their absence.

The Cumberland Telephone Company of Nashville, Tcnn., has purchased the People's Telephone Company of New Orleans, La., whose capital is \$600,000 and bonded debt \$400,000.

The Telephone. Telegraph & Cable Company of America having purchased the Mount Vernon Telephone & Messenger Company, is about to rebuild the entire plant.

A new telephone line between Easton and Millwood, Kan., will shortly be in working order. The poles have all been erected an I wires are now rapidly being strung.

Shawn ..., N. Y., expects to be connected with the outside world in the near future by means of a telephone system.

#### TELEPHONE INCORPORATIONS.

The Exchange Telephone Company of South Center, Kan. Capital stock, \$5,000.

The St. John Telephone Company, Topeka, Kan. Capital stock, \$2,000.

The Midland Telephone & Telegraph Company, Jersey City, N. J.—to construct and operate a telephone system from Hudson County, N. J., to the Delaware River. Capital stock, \$15,000. Incorporators: Edward J. Hale, Melville Eggleston, James C. Vale and Alfred E. Holcomb.

The Highland Telephone Company of Highland Mills, Oringe County, N. Y.—to conduct a telephone system in Orange, Delaware, Ulster and other counties in New York State. Capital stock, \$2,000. Incorporators: J. W. Cummin, W. S. Russell and Henry M. Fitch.

a The United Railways & Electric Company comprises in its organization the Baltimore Consol'dated Railways & Electric Company comprises in its organization the Baltimore Consol'dated Railway Company, the Baltimore Otty Passenger Railway Company, all the lines of street railway operated by these companies, and also the Central Railway Co of Baltia.ore. The pref stock of U R & Elec. Oo. has been issued in the form of income bonds.

b Leased to Brooklyn Rapid Transit Company.

c Owned by Brooklyn Rapid Transit Company.

d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capita' stock.

s Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.

f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave. RR and leased to Nassau system.

h \$30 per share on outstanding capital paid as rental by leasee — West Ohicago &t. RR. Co.;

250 100 of stock owned by North Chicago Street Railroad Company.

d Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and

West Chicago Street Railroad Tunnel Company.

f 550 per annum paid on outstanding capital as rental by lessee.—North Chicago Street Railroad Company;

k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,
000 stock guaranted by West Ohicago Street Railroad, assumit g its bonds

Cincinnati St. Railway purchased the Mt. A. & Eden Park road, assumit g its bonds

\*\*Unlisted. † Full paid. | Outstanding. † Ex-div.
a Leased to New Orleas a Traction Company at 6 % on stock.
b Leased to New Orleas a Traction Company at 8 % on stock.
c Leased to Central Orossown Railroad at 8 % on stock and interest n bonds.
d Operating the former Met. Trac. system, that corporation having become extinct.
e Leased to 23d Street Ry. for 99 years; lease assigned to Metopolitan Street Ry.
f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Ry.
f Leased to Metropolitan Street Ry. at 8 % on stock until Oct. 1, 1897; there after 9 %.
h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at\$215,000 per annum
i Leased to Metropolitan Street Railway for 18 % on stock
f Leased to Metropolitan Street Railway for 18 % on capital stock.

Leased to Metropolitan Street Railway for 18 % on capital stock.
n Dividends of 13/4 % verily guaranteed by Consolidated Traction Company.
o Controls by lease the Alley'ny, Cent., Oitzens' Duquesne, Fort Pitt & Pitt Traction.
p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
c Leased to Consolidated Traction Company for 8 % on capital stock.

Leased to Consolidated Traction Company for 6 % on \$3,000.000 expital stock.

Leased to Consolidated Traction Company for 6 % on capital stock.

Leased to Consolidated Traction Company for 7 % on capital stock.

### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 152@16c.; Lake, 16@16ic.; casting, 15½@15½c.

The United Illuminating Company of New Haven, Conn., has given a mortgage for \$2,000,000, to the New Haven Trust Company as trustee.

The stockholders of the Southern Bell Telephone Company will hold their annual meeting in New York City on February 23. Books close February 19 and reopen February 24.

It was stated that a block of \$500,000 New York Gas & Electric 5 per cent. bonds has changed hands at private sale at about the current market price. T e purchaser is said to be one of the large insurance companies.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 9@9½; New England Transportation, 6@6½.

A special meeting of the stockholders of the Imperial Electric Light, Heat and Power Company of St. Louis, Mo., has been called for March 10, to vote upon a bond issue of \$1,500,000 to be covered by a deed of trust on the property.

The gross earnings of the Manhattan Elevated Railway Company of New York for the December 31 quarter show an increase of \$150,000, and as the expenses have been reduced \$7,000 for the quarter, the net earnings will show a gain of \$157,000.

A dispatch from Columbus Ohio, states that the entire capital stock of the Columbus, London & Springfield Electric Railway Company, \$1,000,000, has been subscribed, largely by Boston men, and that it is expected the road will be completed

The New York & Brooklyn Union Transportation Company has make applica-tion to the Municipal Assembly for a franchise for a tunnel from a point in East Broadway, near the Bowery, under the East River and to South Eighth and Kent streets, Brooklyn.

The Borough of Mt. Pleasant, Pa., has granted the Connellsville & Uniontown Electric Railway Company a right of way through the borough. The company pays \$2,000 for the privilege and promises to have the line in operation within eighteen months.

Subramas have been issued for 625 witnesses to appear before the special grand jury in New York in the Brooklyn Rapid Transit Company stock rigging investigation. The grand jury will require from ten days to two weeks and possibly more time before it will reach a conclusion.

Under a foreclosure decree in favor of the the Guaranty Trust Company of New York, and the United States Mortgage and Trust Company, issued by the Federal Court, the Galveston (Texas) City Street Railway was again sold last week. The price paid was \$905,000 and it is generally supposed the bidder represented the trust companies.

At the annual meeting of the Pennsylvania Manufacturing Company on February 5 President McCall submitted a report which shows that the income from all the companies was \$1,121,650. After payment of the fixed charges, including interest on the Philadelphia Electric 5 per cent. bonds and dividends on stocks, there is shown a surplus of \$55,422. is shown a surplus of \$58,473.

Articles of incorporation have been filed in the clerk's office of Warren County, N. J., by the New Jersey Construction Company, whose object is te construct telephone and telegraph wires in Warren and Northampton counties and do a general business in the line of taking contracts and executing work of all kinds relating to the public good. The company is capitalized at \$100,000. The company consists of Elbert B Bohen, Easton; George R. Macey, Easton and Frank Ricker and Michel Lynch, Phillipsburg.

The Speyer syndicate will loan the Third Avenue Railroad Company \$17,000,-000 for 6 per cent. for three years, which will give the company time to double its property stock and with the new \$17,000,000 stock take up the loan. Bankers receive a commission of 2½ per cent., making money cost Third Avenue nearly 7 per cent. per annum. The company is now earning but little more than the dividend it is paying on \$17,000,000 capital stock because the result of construction expenditure which caused floating debt has not yet been realized, as the work is still incomplete. plete.

Referring to the recent increase of \$5,000,000 in the capital stock of the Erie Tele-Referring to the recent increase of \$5,000,000 in the capital stock of the Eric Telephone Company it is announced that the underwriters have taken up 30,000 shares of treasury stock at par, paying therefor \$3,000,000, which, with the 20,000 shares already subscribed to at par by the stockholders and payable February 14, (to-day) will give the Eric Co. \$5,000,000 in cash with which to carry on their necessary extensions during the year, and entirely extinguish the floating debt of the company. The total issued capital of the Eric Company on February 14 (to day) will be \$10,000,000 full paid The company disbursed for extensions during the past year about \$4,500,000, making a net gain of 43,700 subscribers and a total to-day of 111,000.

It is a well known fact says the Philadelphia "Stockholder" that for sometime past Standard Oil interests have been buying the New York traction stocks in large volume. Under a charter controlled by the Standard Oil Company almost any kind of business may be engaged in, and it would not, therefore, be surprising if it were some day officially announced that it is in absolute control of the transportation facilities of Greater New York. The fact that brokers who usually represent interests closely affiliated with the Standard Oil management have been accumilating stocks of the Metropolitan, the Manhattan, the Third Avenue, and the Brooklyn Rapid Transit companies may be significant.

The Western Union Telegruph Company has decided upon an issue of \$20,000,000 4½ per cent 50 year gold bonds to be known as funding and real estate mortgage bonds. Immediate purpose of issue is to make provisions for bonds maturing during this year and in 1902, and also to provide for construction purposes, demand for special wires being constantly growing. Ten million dollars of bonds have been sold to Kuhn, Loeb & Co. The company will provide for bonds maturing in 1902 out of proceeds of new issue. These 1902 bonds are 7 per cent. and amount to \$1,163,000, consequently the company will refund in all about \$6,100.000 7 per cent. bonds and about \$7,000,000 6 per cent. bonds, in all say \$7,000,000. Saving in fixed charges is about \$166,000 annually. charges is about \$166,000 annually.

Certificates of merger in New York City with the New York Gas and Electric Light, Heat and Power Company have been filed with the Secretary of State at Albanv. They are the North River Electric Light and Power Company, New York Heat, Light and Power Company, Manhattan Lighting Company, Mount Morris Electric Light Company, Borough of Manhattan Electric Company and Black Lighting and Power Company, number one. The New York Gas and Electric Light, Heat and Power Company takes all the stock, assets and franchises of each company and assumes its obligations. The capital stock taken from each company is as follows: North River Electric Light and Power Company, \$400 000. New York Light, Heat and Power Company, \$375,000; Manhattan Ligh ing Company, \$250,000; Mount Morris Electric Light Company, \$1,500,000; Black Lighting and Power Company, number one, \$98,000; Borough of Mannattan Electric Company, \$1,000,000.

# Shall We Have Public Ownership?

Shall this country have public ownership on a grand scale? This is the question

that is at present troubling Congress, and many bills looking to the adoption of public ownership have been introduced in both branches of the National Legislature. Strange as it may seem the considerations that are urged in favor of public ownership are the reduction of the cost to the general public, and the betterment of the service generally. As in all arguments on this question innumerable alleged facts are cited in support of the reduction of cost theory. For instance, it is stated that in 1890 Boston paid \$237 per arc lamp for its street lighting service, while St. Louis was paying only \$75 for the same service. It is urged that investigations that have been carried on in various States show that the street railways net from 15 to 25 per cent. on their actual value: that telegraph profits usually run from 12 to 30 per cent. a year, and some cases of even 116 to 147 per cent. have been unearthed during such investigations.

Turning from governmental ownership to municipal ownership, the gentlemen with socialistic tendencies behind the bills in Congress point out that Aurora, Ill., paid \$325 per annum for each electric street light while they were under private control, and but \$72 a year after the plant was taken over by the city. In this connection it might have been added-but of course it was not policy so to do-that the operating expenses of the Aurora, Ill., plant since it became municipal property, have steadily increased from \$5,243 a year to over \$10,000 a year.

Another case cited is Fairfield, Iowa, in which the cost of arc lamps is said to have dropped from \$375 to \$95 a year, which may have been the case in view of the fact that in that city the electric light plant is run in connection with the water works plant, and the cost of all labor except the wages of one man is charged to the water works account.

These and others of a similar nature are some of the arguments brought up in favor of public ownership. But admitting, for the sake of argument, that a number of municipal electric lighting plants throughout the country have proven fairly successful, there are three times as many that have utterly failed, and even when a plant is claimed to be making a creditable showing, a careful examination into the books and methods of operation will usually reveal the fact that many expenses are not charged to the electric lights that should be.

# The Outcome of an

In the issue of ELEC-TRICITY of December 21, 1898, we referred Elevator Accident. editorially to an elevator accident which

occurred in this city on December 6, 1898, and in which Mr. Walter H. Griffin, a well-known insurance man, lost his life. The accident was due to the automatic stop on the motor which operated the elevator not being properly set. Several hours previous to the accident this very elevator had been carefully examined by an inspector of the Building Department, and he had immediately reported, so it was stated, to the janitor that the stop was not properly adjusted, and yet in spite of this fact the elevator was kept in service. In the report submitted at the time as to the cause of the accident it was further claimed that the operator failed to properly judge the distance to the ground floor. The car accordingly struck the bumper at the bottom of the shaft causing the back-draw weights to raise the car weights, thus tipping the latter into the elevator shaft, and killing Mr. Griffin.

Commenting at that time on the tendency of owners of buildings to throw the blame for accidents of this nature on to poorly paid employes, we said:

"As we have stated in previous editorials, although in many cases the employes in charge of the apparatus are directly responsible for the accidents, those who deserve the greater censure are the agents or even owners of the buildings, who, with a view to keeping down expenses, invariably seek cheap labor at the possible expense of human lives."

In view of the stand we took at that time a decision recently handed down in the Appellate Division of the Supreme Court in the case of Anna S. Griffin, the widow of Mr. Walter H. Griffin, versus William D. F. Manice, the owner of the building in which the accident described above occurred, is extremely interesting to say the least. Mrs. Griffin, as the plaintiff, sued to recover damages for the death of her husband. Mr. Manice, the defendant, introduced no evidence at the trial, there being a clause in the lease to the insurance company, of which Mr. Griffin was a member, providing that the owner of the building should not be responsible for damages for any loss or injury caused in any elevator accident that might occur. In spite of this fact the plaintiff got a judgment for \$22,500 and \$700 costs, and Judge Patterson in writing the opin ion of the court stated that the responsibility of the owner of an elevator is similar to that of a common carrier, and that he is bound to maintain the machinery in good order. In summing up the judge, referring to the lease, said

"We do not construe that covenant as being binding upon the plaintiff's intestate, so as to relieve the defendant from liability for the negligent maintenance of the machinery used in operating and controlling the elevator.

"We do not mean to decide that the covenant would be binding upon him in any event, but assuming that he might otherwise be brought within its operation, we do not think its fair interpretation is such as to relieve the defendant from the responsibility for neglect in proper care, attention, supervision and inspection of that machinery and those appurtenances of the elevator which gave way and caused the death of the plaintiff's intestate.

"Under all the circumstances of the case we cannot say that the verdict of the jury was excessive."

That the owner of a building should be held responsible, if by putting in poor or cheap machinery or by employing inefficient labor an accident occurs, we have always held, and the recent decision of the Appellate Division of the Supreme Court would seem to bear us out in our opinion. If, however, the owner of a building can be held liable for damages in a civil suit of the above nature, why cannot he be held liable in case of accident with loss of life for criminal neglect? Were drastic measures adopted for cases of this kind property owners would be far more careful in the selection of elevator and other employes, with the result that the loss of life through defective elevator machinery and reckless handling would be materially lessened.

\* \* \*

The Pan-American Exposition.

In spite of the fact that it will be more than a year before the Pan-American Exposition is held in Buffalo, the in-

terest that has been taken in it and the untiring efforts that have been made to have it a success, would seem to assure that much benefit both directly and indirectly will be derived from it by the countries of the New World. In his message to Congress on December 6, 1899, President McKinley, referring to the Pan-American Exposition, said:

"This Exposition, which will be held in the city of Buffalo, in the near vicinity of the Niagara cataract, and within a day's journey of which reside 40,000,000 of our people, will be confined entirely to the Western Hemisphere. Satisfactory assurances have already been given by the diplomatic representatives of Great Britain, Mexico, the Central and South American Republics, and most of the States of the United States that these countries and States will make an unique, interesting and instructive exhibit, peculiarly illustrative of their material progress during the century which is about to close.

"The law provides an appropriation of

\$500,000 for the purpose of making an exhibit at the Exposition by the Government of the United States from its executive departments and from the Smithsonian Institution and National Museum, the United States Commission of Fish and Fisheries, the Department of Labor, and the Bureau of the American Republics. To secure a complete and harmonious arrangement of this Government exhibit, a board of management has already been created, and charged with the selection, purchase, preparation, transportation, arrangement and safekeeping of the articles and materials to be exhibited.

"This Board has been organized and has already entered upon the performance of its duties, as provided for by the law. I have every reason to hope and believe that this Exposition will tend more firmly to cement the cordial relations between the nations on this continent."

From the above, and when it is added that the State of New York has appropriated \$300,000 for exhibition purposes and that the company interested in the Exposition has authority to issue \$2,500,000 in bonds, it will readily be seen that the resources at the command of the Exposition are sufficient to ensure a most creditable show.

Being within some twenty miles of Niagara Falls. from where an almost unlimited amount of electric current can be obtained, naturally one of the principal features will be the elec-. trical display at night. The plans for the electrical illumination of the Exposition which have just been completed call for numerous electric fountains, which will surpass in beauty, so it is thought, anything heretofore shown at similar gatherings. Besides what is known as a court of fountains, which will be lighted by over 100,000 incandescent lamps. there will be a so-called electrical tower 300 feet high. In the latter will be a niche 70 feet high and 30 feet wide in which a most beautiful water display will be given. A large jet of water will be broken into drops by means of an ingenious device and under the powerful electric lights focused upon the jet the individual drops will be made to reflect the colors of the spectrum.

Surrounding the tower will be a basin 90,000 square feet in area. In front of the niche will be an illuminated cascade, the water of which will finally flow into the basin where there will be numerous allegorical conceptions of statuary rising from the water. These figures will be surrounded by fountain effects not unlike the fountain designed as one of the main features of the Paris Exposition.

One of the many novelties proposed is an electrically-luminous air fountain capable of an iridescence and color effect and peculiarity of form never before seen. Advantage will be taken of the opportunity for electrical figure work in the water basin. It is promised that this display will be exceptionally pleasing.

Some idea may be had of the electrical requirements of the enterprise when it is stated that illumination must be afforded for more than 250 acres of buildings and grounds.

From a commercial standpoint the Exposition which opens at Buffalo on May 1, 1901, should prove of no little value by familiarizing the countries of South America with the manufactured products of the United States.

THE New York "Commercial" is waging a vigorous war against the Bell Telephone Company. In a recent issue the following

editorial appeared: "The telephone monopoly is doomed. It may take a little time, but the activity of those corporate interests which are arrayed against the Bell people can have but one meaning-competition. With competition will inevitably come a reduction of rates. The people who have great respect for patent rights have no sympathy whatever with corporate greed. And the people know that the dividends paid by telephone companies are out of all proportion to the actual financial investments of such companies. The people know that they have been paying dividends on an earning capacity made possible by franchises which originally belonged to the community itself. And the people know, furthermore, that it costs less to build and maintain lines in large cities than it does in rural districts; therefore, they understand that the price of telephone stock in large cities is reckoned upon the value of franchises rather than upon the assessment of tangible property. Independent lines are making great gains. There are five distinct movements under way against the monopoly. Sixty thousand miles of wire are strung already, and every foot of it is a menace to the concern which has fattened on special privileges."

# UNDER THE SEARCHLIGHT.

## Notes and Comments on Various Topics.

A BILL has been introduced in the House at Albany, N. Y., by Assemblyman Knipp providing that hereafter no wires for telephone, telegraph or electric light shall be strung nearer than twelve inches to the center of the pole, and that all wires now strung contrary to the above shall be changed to conform with this act.

The National Weather Bureau is said to be conducting a series of experiments in wireless telegraphy that promise to yield highly interesting results. Such work does not appear to be directly related to meteorological forecasting, but the Bureau enjoys exceptional advantages for an inquiry of this sort, and if a technical excuse be needed it may be found in the possible economy that may be affected, in consequence of this venture in the transmission of the Bureau's own messages.

THE Western Union Telegraph Company has introduced at various points the system which permits the sending of four messages continuously over the same wire—two each way. It was tried on a line between Joplin and Kansas City, Mo., and failed to work. Investigation developed the fact that it was caused by zinc deposit, which is som ething of a surprise to electricians, who are proceeding to investigate the matter.

THE Texas Assembly passed a bill placing a tax of \$5,000 per annum on any telephone or telegraph company which uses its lines for conveying market quotations for brokerage business.

WILLIAM A. EDDY, of Bayonne, N. J., recently tried the experiment of photographing pieces of metal by means of electricity drawn to an iron grounding rod driven into the earth. The electric brush lights and sparks emanated from a kite sustained steel-wire. A four by five inch photograhic glass plate, used without a camera, was wrapped in three thicknesses

of black paper and three thicknesses of red paper, to exclude the daylight. Three small pieces of metal of fanciful shapes were fastened to the outside of the package, two on one side and one on the other. Then the six foot kite, flown with steel wire, was sent to a height of about fifteen hundred feet, resulting in one inch sparks at the earth and powerful brush lights. The photographic plate was subjected to hundreds of sparks and powerful brush lights for more than four hours. Mr. Eddy believes that the electric brush lights will make shadowgraphs of the metal pieces, the electricity penetrating the interposed wrappings. The plate will be developed at once. It was discovered that light rain lessened the length of the electric spark from the kite wire, but that very small sparks could be drawn with the kite only forty feet above the earth. During a fog the electric action was abnormally strong, one inch sparks being drawn when the kite was at a height of only two hundred feet. With the kite fifteen hundred feet high it was discovered that boys with wet shoes were slightly shocked through the moist earth when near the grounding iron.

THE New York "World" says that the secret issue by the Consolidated Gas Company of \$36,000,000 of debenture bonds for the purchase of the New York Gas and Electric Light, Heat and Power Company and all allied concerns illumines with an incandescent glare the new principle of law that "minority stockholders have no rights.'

THOMAS A. EDISON, Jr., says he has succeeded in constructing an electric miners' lamp, which he is satisfied is absolutely safe. The lamp has been subjected to reverse tests and proved satisfactory. The supreme test will be made this week, when it will be lighted surrounded by gunpowder.

THE definite announcement of the formation of several automobile transportation companies in Denver, Col., is causing much speculation among the owners of realty along the streets which the various lines will traverse as to the effect the service will have upon the value of their holdings. While it is generally conceded among owners of property in the residence district that a street car line depresses values in the immediate vicinity of the service, it is thought the proposed automobile service will be no detriment, but on the contrary. have a favorable effect.

MR. HITCHCOCK recently introduced in the Assembly at Albany, N. Y. a bill to compel the the placing of safety fenders on cars propelled by electricity, compressed air or cable in the streets of cities of this State, the style of fender to be adopted to be approved by the State Board of Railroad Commissioners.

A LEADING banker, in discussing the gas and electric lighting situation in New York City, said: "The purchase of all of the electric lighting companies in the boroughs of Manhattan and the Bronx by the Standard Oil interests and the control of the lighting facilities of New York by this powerful syndicate is merely an incident in a colossal deal. The public may be surprised to learn that the Standard Oil interests, in connection with the Rothschilds, now control all of the copper output of the world. They have absolutely all of the copper mines that are worth working and all of the undeveloped copper lands that are

worth owning. The uses of copper, outside of the electrical field, are boundless. Look at the amount that is consumed in manufactures, the consumption that will result from the sheathing of all of the modern warships, and the requirements of coinage by all of the countries in the world. These are but illustrations. Gas is played out for lighting purposes in the cities. Electricity is rapidly driving it to the wall, and gas companies that have not the business foresight to turn to electricity as a supplemental system will be outstripped in the race for business. Of course the Standard Oil people can very well run the two together profitably.'

MR. H. H. VREELAND, president of the Metropolitan Street Railway Company, received a remarkable Valentine on the 14th inst. in the form of a check for \$100,000, the joint gift of the members of the Whitney syndicate, the controlling interests in the Metropolitan system. The gift was presented as a token of their personal appreciation of the value of Mr. Vreeland's services in the building up and the management of the great street railway corporation of which he is the executive head, and has no relation to the salary which Mr. Vreeland receives from the Metropolitan Street Railway Company as its president. An indication of the success of Mr. Vreeland's management of the Metropolitan may be seen in his report of the results of the operation of the system for the first fifteen days of February, 1900, in comparison with the corresponding period of last year. The mileage now is the same as it was last February, yet the receipts for the first fifteen days of the current month have been \$571.053.-95, as against \$411.515.40 for the first fifteen days of February, 1899, an increase of \$159,538.-

GEN. A. W. GREELY, Chief Signal Officer, United States Army, says that all of the energies of his department are at present being directed toward the establishment of a thorough telegraph and telephone system in the Philippines to meet the constantly growing demand for such service, incident to the military operations in the islands. The lack of a mail system in the Philippines allows only telegraphic or telephonic communications, and at present over 100 telegraphic and 150 telephonic operators are established in the Island of Luzon, but as the capture and occupation of each town create a demand for a means of communication, there is an ever increasing need for instruments, operators, and other equipment.

In consequence of the heavy rains the dam of the Empire State Power Company at Schoharie Falls, N. Y., where an electric light plant is being built, has been damaged to the extent of \$2,000. Power engines and derricks have been carried down the stream. The water in the Mohawk River continues high but the ice west of Fonda is still intact.

THE elevator trust has recognized a San Francisco inventor and his backers in a substantial manner by purchasing the patent rights for the electric elevator system originally invented by Ethelbert Fraser of San Francisco and perfected through the co-operation Mahoney Brothers, contractors, George Crocker, Charles E. Green and Andrew Mc-Nicholl. The Fraser patents apply electricity as the motive power in the operation of elevators by means of two motors, thus avoiding

the disagreeable jar accompanying reversal of the movement. The San Francisco company was preparing to establish a plant in the East, when the trust stepped forward and acknowledged the merits of the invention by the purchase of the patent rights for the entire country. It is understood that the consideration received by Fraser and his friends is \$175,000. a portion in cash and the remainder in stock of the trust, although some reports place the price much higher.

THE company controlling the street lighting and horse tramway line in Bombay, India, has applied to the municipality for the privilege of converting its motive power to electricity. The company has its office in New York City, and its stock is owned principally in the United States.

J. KNIGHT HARDY, a Chicagoan, who has spent most of his life in the study of metallurgy, says he has discovered a process by which he produces from lead a metal that has all of the chemical and mechanical qualities of tin, and that also it is non-frictional. He is having his product experimented upon by large manufacturing concerns with a view to testing it for mechanical uses. He also makes a product of copper, so hard, he declares, that it may be used in car journals, and it is non-frictional. The latter product, he says, will some day be used instead of steel in railway car journals, where friction is now one of the obstacles to be overcome. The tin-like product that Hardy exhibits in ingots is as heavy as lead and it is so hard that it can scarcely be scratched with a knife blade. Mr. Hardy says that it can be produced at one-third of the cost of tin, and that for all purposes it is just as good. Both metals, he claims, can be tempered to any degree of hardness.

A class of twenty-five students from Columbia College, New York, accompanied by Professors Crocker and Seaver visited Mechanicsville, N. Y., last week to make a special investigation for scientific purposes of the power plant of the Hudson River Power Transmission Company. They were shown over the plant by Superintendent E. J. Richards, spending about three hours in the inspection. They also visited the General Electric works at Schenectady, where much time was spent in the examination of the immense plant.

THE Glasgow Tramway & Street Railway Company of Glasgow, Scotland, has awarded to the Riter-Conley Manufacturing Company of Pittsburg, Pa., a contract for structural iron and plate work amounting to 1,300 tons of shipment, and involving over \$100,000. The work on the material for this large contract is now under way at the works in Pittsburg and the Pittsburg concern expects to start work in Glasgow in April. The awarding of the contract is a distinct victory for the American manufacturer over the British.

THE Canadian Electrical Association will hold its annual convention in Ottawa June 27, 28 and 29. The following committee has been appointed to arrange the programme of papers for discussion, etc.: Messrs. J. J. Wright, Toronto; T. J. Gossler, Montreal; E. C. Cary, St. Catherines; D. R. Street and O. Higman of Ottawa. A committee of twenty interested in electrical matters at the capital was also formed to arrange with the first committee for the entertainment of the delegates, programme of proceedings, etc.

#### LONDON NOTES.

[From our London Correspondent.]

#### Physical Society.

Before this society on January 26 Prof. Ayrton and Mr. Mather read a paper on "Some Developments in the use of Price's Guard Wire in Insulation Tests" and in the discussion which followed Messrs. Campbell and Appleyard took part.

This was followed by a paper by Mr. Barton and Mr. Lownds on "Reflection and Transmission of Electric Waves Along Wires," and one by Mr. T. J. Baker on "The Frequency of Transverse Vibrations of a Stretched India-Rubber Cord."

Mr. Rollo Appleyard contributed a paper on "A Fault Test for Braided and Other Cable-Core," this being a method for finding a fault without removing the braiding or tape. He subsequently exhibited some mirrors produced inside incandescent electric lamps by the application of voltages much above those for which the lamps were designed, and the consequent deflagration of the filaments.

#### **London Underground Electric Railroads**

The experiments which have recently been proceeding with a view to conversion of the Metropolitan underground railways from steam to electrical working have not yet reached a stage which enables the board to come to a definite decision. The chairman of the company has expressed himself disappointed with the delay in completing the trials. These experiments have been generally conducted after the traffic has ceased at night and on Sundays, but this is not considered to be a fair test. The section of line which has been prepared with electrical conductors is between Earl's Court and Kensington and is about a mile long, but we gather that the company has made other trials on land at Wembley Park, which have furnished valuable information which is expected to assist materially in solving the present problem. In connection with this matter we may mention that the District Company which works along with the Metropolitan to a large extent, is applying for Parliamentary powers so that it may erect and equip electric generating works at Chelsea for working the two undertakings, and further for furnishing energy to other projected underground lines.

The City and South London Railway Company has for some reason or other found it necessary to pay a reduced dividend, which brings the dividend for 1899 below 2 per cent., but as the Clapham, Moorgate Street, and Islington extensions are now well in hand, the first two nearing completion, not much importance need to be attached to the reduction. Without these extensions the line never could possibly be a great success financially, but when they get to work the traffics to be dealt with will be so enormous, on account of the favorable districts tapped, that notwithstanding the very heavy capital outlay upon underground tunneling operations the profits promise to be more satisfactory than the pioneer line, in fact they are thought to be the salvation of the concern. The new power station was expected to be completed months ago, but these anticipations have not been realized, and March will witness their fulfillment.

The Central London Railway will not commence working until March or April. It will be remembered that this is the railway for which so much American machinery, etc., is

being supplied, but so far as we understand the fault for the delays does not lie with the electrical plant contractors. A variety of other unavoidable delays have arisen, among them being the difficulties in getting steel work delivered.

Construction work in connection with the Great Northern and City, and the Baker Street and Waterloo electric underground lines is being pushed forward and other new schemes are now being projected.

# RELATIVE EFFICIENCY AND DE-SIRABILITY OF VARIOUS TYPES OF ENGINES ON CENTRAL STATION LOADS.\*

BY A. W. RICHTER.

The first records in the history of the steam engine are those of Hero, 120 B. C.: But for many centuries following little of any real commercial value was accomplished by the different inventors. In 1698, Thos. Savery patented a device which was used to some extent to raise water out of mines and which might be considered as a partial commercial success. To Newcomen and Calley (1705) is awarded by some the honor of being the inventors of the modern steam engine. This appears a just claim despite the familiar story of the invention of the steam engine by Watt as a direct result of his observing that the cover of the kettle rose as the steam escaped from the boiling water. Newcomen and Calley were the first to produce a train of mechanism capable of transmitting power from its source to the resistance to be overcome.

Watt, however, has done more than any other one man toward the development of the steam engine and receives credit accordingly. In 1763 a model of the Newcomen engine was put into Watt's hands for repairs; this led him to a deeper study of the steam engine and to an experimental reseach into the properties of steam. Watt determined the source of the loss of heat in the Newcomen engine, then he determined the amount of these losses and finally sought the remedies. Watt saw that it would be advantageous to keep the cylinder "always as hot as the steam that entered it." To accomplish this he devised the separate condenser and air pump, his greatest invention. From the time of Watt, the development of the steam engine has been gradual but certain, probably the only very rapid advance being that of Corliss when he brought out his detachable valve gear.

All requirements of the electric station engine may be summed up under the head of economy, economy being used in its broadest commercial sense. It includes not only the fluid efficiency of the engine proper but also the mechanical efficiency of the machine. durability, and the ease of subdividing into the most economical units, it being borne in mind that the demand for power changes with the different seasons as it does also during the different hours of the day. Close regulation may also be considered a subdivision of this general requirement, economy. Many of us remember the condition of the lights as regards intensity and uniformity some 15 years ago when electric lighting was first introduced The engine builder has as yet not met the demand of the dynamo as regards regulation. This deficiency, at first met by but one or two firms, was grad-

ually remedied by the majority until now many engines are on the market with regulation sufficiently close for lighting purposes. Some are guaranteed to regulate as close as one half of one per cent., allowing a variation of but one revolution in two hundred per minute. Although the question of regulation may be considered as solved by many manufacturers, great care must be exercised in this direction when choosing a station equipment.

From the time of Savery and Newcomen, with a duty of but a few million foot pounds per one hundred pounds of coal, the engine has gradually advanced, until we have attained the high efficiencies of the present day. The very highest efficiencies reported are those of the Nordberg pumping engines at Wildwood, Pa., showing the remarkable duty of about one hundred and sixty-three millions foot pounds per one million B. T. U., and the performance of the Sibley College quadruple expansion engine with a reported consumption of less than ten pounds of steam per I. H. P. per hour.

Such high economies have not been reached in power and lighting station engines, and probably never can be, but there is no reason why with modern appliances and with the gradual improvement in the efficiency of such appliances, results more nearly approaching these should not be attained in station engines.

Considering the efficiencies quoted as standard we must look upon the station engine as a very uneconomical machine; this is especially true of the street railway engines. The deficiency is due principally to the great fluctuation in load added to the fact that the engines are usually underloaded, in order to enable them to carry the "peak" of the load.

The general improvement called for in station engines, as indeed in all other engines, is the reduction of—

First—Cylinder wastes effected by (a) the kind, size and style of engine, and (b) the introduction of the storage battery and other equalizing devices.

Second—Transmission lesses from cylinder to dynamo.

Third—Losses and wastes in auxiliaries, piping, etc.

In discussing the style of engine for powerand lighting purposes, time will not permit a discussion of all the details, but it is hoped that some of the principal points may be made clear. In order to meet the demands of the varying load on the engine, the work done in the engine cylinder must be varied, the changes being in all cases automatic. This is accomplished by throttling as in the throttling engine or by varying the range of cut off as in the automatic cut-off. The only advantage of the common throttling or slide valve engine is its cheapness. The workmanship is usually very poor, causing leaks and increased friction. This engine uses more steam per given power than any other engine on the market, its consumption being about sixty pounds of steam per indicated horse power per hour, in some cases it even exceeds that amount.

The only circumstance that would make the use of this engine excusable, though probably not advisable, would be if all the exhaust steam were used for heating purposes. The great difficulty, however, is that seldom, if ever, can all of the exhaust steam be utilized. Having then practically discarded the common throttling engine, we will consider for a moment the automatic cut-off. Classified as to valve gear

<sup>\*</sup> Abstract of paper read at the eighth annual meeting of the Northwestern Electrical Association, Milwaukee, Wis., Jan. 18, 1900.

we have the drop cut-off engines and these engines which have a positive valve gear. Considering speed as a basis we have the high and low speed engines. We have also the condensing or non condensing engines, the simple, compound, triple expansion engines, etc.

The principal types of the drop cut-off engines are the Corliss and some poppet valve engines. The advantages of these engines lie in the fact that steam is admitted at a pressure almost equal to the boiler pressure. A more perfect steam distribution can be maintained for the different points of cut-off. The rapid motion of the valve at cut off and admission causes less wire drawing at these points. All of these points result in an increased efficiency. The first cost of these engines is however considerable as the valve gear is usually quite complicated.

The action of the Corliss and other detachable valve gear engines limits their speed to that of slow and medium speed engines.

Passing on to the consideration of the high and slow speed engines we find that all engines may be run direct connected. The high rotative speed permits the direct connection of engine and dynamo at less cost than the slow speed, as the reduction in speed necessitates an increase in the size of the dynamo and engine and in the amount of material used in their construction.

Increasing the speed of an engine reduces the time allowed for initial condensation and therefore, other things being equal, reduces the amount of steam condensed in the cylinder. On the other hand, high speed engines are usually constructed with a proportionately shorter stroke than are engines of less speed and with greater clearances and port areas. thus presenting more condensing surface to the inflowing steam. They are, consequently, more subject to internal wastes by cylinder condensation. High speed engines are more easily regulated and operate with less friction: they are, however, more subject to wear and accidents. Accidents occurring with high speed engines are usually much more serious in results than with engines running at lower speeds. The slow speed engines are generally more economical insteam consumption though some of the high speed engines, as the "Willans," show a remarkably good efficiency.

If it is desired to obtain the very highest engine efficiency, slow or medium speed engines should be used, while if the first cost is of prime importance, it might be advisable to use engines of high speed; but it should be remembered at all times that the cheaper engine usually increases the cost of boilers and auxiliaries. There is no reason however why the high speed engine should not be used for the necessary duplicates.

Condensing engines are more economical than non-condensing because the temperature of the exhaust steam is less. As the effective steam pressure is greater for the same cut-off a smaller cylinder is required for the same power. With engines of equal power and of the same size cylinders the steam can be cut-off earlier in the cylinder of the condensing engine, consequently less steam is used per stroke and therefore per horse power. The cylinder condensation and subsequent re-evaporation depends in part upon the range of temperature in the cylinder through which the steam acts. The compound engine has an advantage over the simple engine in that this range of temperature is reduced; the volume of each of its cylinders is less, and consequently the

condensing surface, which gives of course a lower initial condensation. The efficiency of the compound engine is also increased by the fact that the steam re-evaporated during expansion is again available for work in the next succeeding cylinder.

Compound engines are used more generally than triple expansion engines, not alone on account of first cost but also because of the variable load; triple engines cannot attain a sufficiently greater economy to warrant their use in many cases. Of the compound engines, the tandem has an advantage in first cost, compactness and small friction. The cross compound has lighter stresses in its running parts and has no dead center when the cranks are set at an angle of ninety degrees.

Engines of the vertical type require less floor space and have less friction as compared to those of the horizontal type.

On several occasions the following question has been put to me by members of the electrical fraternity-"Is it advisable to place a heater in the exhaust of a condensing engine?" It seems that claims are occasionally made by unscrupulous agents that the feed temperature can be raised to a considerable amount, say two hundred or one hundred and eighty degrees. Suppose we have a pressure of two pounds absolute in our exhaust pipe, corresponding to a temperature of one hundred and twenty-six and three-tenths degrees. It stands to reason that if a heater be introduced without changing the conditions, the temperature of the feed water leaving this heater must be considerably below one hundred and twenty-six degrees. Should the temperature of the feed water be higher, it would simply show that with the introduction of the heater sufficient resistance has been introduced to raise the temperature and pressure of the exhaust steam and consequently the back pressure on the engine. The loss occasioned by the rise in the back pressure will of course be greater than the gain occasioned by the rise in the temperature of the feed water. This would be true even though the vacuum gauge, which is usually connected directly to the condenser, may show no apparent change of vacuum.

With the possible exception of the rolling mill, the variation in load upon an engine is probably no where as great as in the electric station. This is especially true of the street railway engine in which we have sudden changes of from a few amperes to the maximum output of the station. The lighting load offers no such great sudden changes, although here also the load varies considerably with different hours of the day.

Unless other means are provided, the engine must immediately respond to these variations of load; the engine must then be of a size to enable it to carry the heavy maximum load. It will at once be seen that for a greater portion of the time the station engine is an underloaded machine. This evil has been greatly mitigated by the introduction of the storage battery. In taking up the rapid fluctuations, the battery relieves the engine of this duty and makes the engine load more constant. We are told of tests in which the fluctuation of the engine load has been decreased to a remarkable degree.

In an article on "Electric Tramways with Stationary Accumulations" by Ludwig Schroder, the following appeared in the "Electrician," London, July 30, 1897.

In speaking of the Remscheid Electric

Tramway he says: "The battery consists of two hundred and fifty cells having a capacity of 648 ampere hours at a discharge rate of 216 amperes, though a current up to 420 amperes may be taken from them. Eight cars seat sixteen passengers each and there is standing room for twelve more. The current delivered to the line for factory motors and tramway varies from 100 to 460 amperes on week days the mean being 232 amperes. The current from the machine varies from 210 to 255 amperes. Without the factory load the current supplied to the line varies from 0 to 375 amperes, its mean value being 135 amperes; the currrent from the machine varies from 115 to 150 amperes. The pressure varies from 495 to 510 volts. It has been calculated that at this station over eleven tons of coal are saved per week since the traction system was altered, but it is not only the coal consumption that must be considered. Two hundred horse power of dynamo output has been saved and the battery that effected this saving only cost one-half as much as the machines which have been set at liberty and are now available for any further increase in the load.

In reports of the Chicago Edison station it appears that about twenty-five per cent of the peak of the load is carried by the batteries.

Many similar cases could be cited but those given will be sufficient to illustrate the effect of the storage battery when introduced as a part of the station equipment.

The extreme fluctuations and the peak of the load being carried by the storage battery the size of the engine can be reduced. The engine can be of a size more nearly equal to the average load of the station. Its cylinder condensation could thus be reduced. As the fluctuations decrease, the triple expansion will show a greater commercial gain over the compound and simple engines. It will be possible to introduce larger units with an increased economy.

There is now and always has been a tendency

There is now and always has been a tendency toward the introduction of higher steam pressures. The time is probably not far distant when steam pressures of 400 or 500 pounds will be used with a corresponding increase in the number of cylinders. All of these conditions will tend to increase the efficiency of the station; the greater the improvements, the more nearly will the efficiencies approach those of engines having perfectly constant loads, as our modern pumping engines.

## Conductivity of Amalgams.

The resistance of amalgams possesses a special interest, as shedding light upon the problem of metallic conduction without introducing the complications of structure inherent in solid metals. But even so, the amalgams must be dilute and of pretty high temperature if they are to give simple results. Weber, Matthiessen, Veigt and Battelli only obtained consistent results with perfectly homogeneous amalgams. A. Larsen has done some work on the amalgams of lead, zinc, cadmium, tin and bismuth at the ordinary temperatures of liquid water, and plotted curves showing not the change of conductivity but the change of conductivity as compared with that of pure mercury. The general result that of pure mercury. The general result from the lead amalgams is that the relative conductivity increases in proportion to the temperature, and that increase again increases with the concentration of the amalgam, though not quite so rapidly as that. This rule applies up to the saturation of the amalgam, which occurs at a concentration of about 1.6 per cent. in lead amalgams, 2 per cent. in zinc amalgams, and about 5 per cent. in cadmium amalgams. All the results indicate that in the amagams. All the results indicate that in the dilute amalgams the metal is dissociated, and this dissociation, as generally in solutions, increases with the temperature—A. Larsen in Ann.d. Physik, No. 1, 1900. The Coventry Tramway System has of late undergone many changes. A new generating

station has been built, the plant extended, and

new routes have been opened for traffic.

The number of cars in regular running is now 16, while on special occasions 20 motor cars and 5 trailers are put in service. The length of line amounts to 8½ miles single track, and 2 miles double track, the latter being the total length of the turnouts; the ruling curves are of 40 to 60 feet radius, and the maximum grade is 1 in 12, 60 yards long.

The new power station is situated in a central position. The engine room is 25 feet wide by 80 feet long, and the boiler room 40 feet by 60 feet; the stack is 100 feet high, 6 feet 4 inches diameter at the top, and is based on a concrete foundation 22 feet square.

There are four Babcock & Wilcox boilers, two of 172 hp., and two of 106 hp., fitted with patent mechanical stokers and endless chain conveyor; the latter carries the coal direct from the coal store alongside the canal. The grates are of the open ash-pit type, with patent steam-jet fire-bars. The station is in the happy condition of having a good demand for ashes, which not merely cost nothing for removal but are paid for.

A Green's economizer of 240 tubes, is provided; the scrapers are driven by a small steam engine, formerly used for lighting at the old station, and which also drives the stoking machinery. There are three Worthington pumps, each of which can feed three boilers; the make-up water is drawn from the town mains, with the canal as an alternative. The condensed water is passed through a filter to free it from oil.

The engines which were originally installed were simple and non-condensing; these have been compounded by the addition of highpressure cylinders in tandem with the others, and are now run condensing at 150 hp. each. They have also been fitted with new fly-wheels, with which are combined governors of the Begtrup type. The old ones drive the original generators by leather belts, 15 inches wide, with cemented joints, which run with remarkable smoothness. The two new engines are coupled direct to their generators, and run at 250 revolutions per minute, developing 150 hp. each. The cylinders of the latter are 13 and 19 inches in diameter, with 13 inches stroke. The Begtrup shaft governor is being largely applied to engines for electric traction and transmission of power, on account of its high sensitiveness and quick action under extreme variations of load. Both high and low pressure valves are actuated by the one spindle, which is directly controlled by the governor, so that the cut-off and compression in both cylinders are immediately altered upon a change occurring in the load. The stuffing box between the two valve-chests is packed with U.S. metallic packing, and although it is inaccessible without removing the cover of the valve-chests, we were informed that it gave no trouble.

The older generators are of the four-pole type, running at 650 revolutions per minute; the others are six-polar, running at 250 revolutions per minute; all are rated at 100 kw: each.

Besides the four large sets, a small lighting set, consisting of a single-acting engine and dynamo, has been provided for use after the

traction generators have been shut down; as the dynamo runs at 500 volts, it is available for working the shop motors if required at night, besides lighting the car sheds, power station and any part of the track where work is being carried on. The dynamo is multipolar, of 17 kw. output, and runs at 400 revolutions per minute.

ELECTRICITY.

The condensing plant, which is fixed in a pit

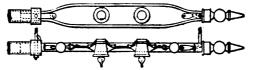

FIG. 1.—HARP FOR BRACKET ARM SUSPENSION. in the floor of the engine room, is in duplicate, each set consisting of a surface condenser of 450 feet surface, and a pair of balanced vertical air-pumps driven through single reduction double helical gearing by a steam engine.

The air-pump barrels are 12½ inches diameter, with 8 inches stroke, making 100 double strokes per minute when the engine runs at 300 revolutions per minute. A centrifugal pump is driven from the fly-wheel of the engine by means of a belt, and draws water from the canal at one point, circulates it through the condenser, and returns it to the canal at another point. Each set is capable of dealing with all the steam from the engines when indicating 300 hp. Although the plant is situated

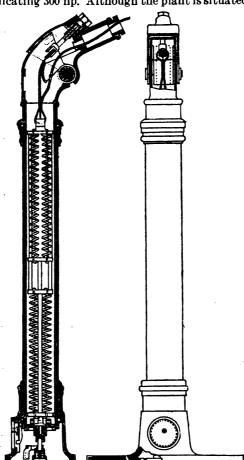

Fig. 2.—Constant Pressure Trolley Standard.

below the floor level, it is so arranged that every part is readily accessible, and the condenser tubes can easily be withdrawn. An automatic relief valve is provided for atmospheric exhaust in case of need.

The main switchboard consists of eight panels—four generators, two feeders, one lighting and one Board of Trade—and is at present incomplete, the ornamental border and clock being lacking. The panels are of marble, and are equipped with the usual apparatus. Two of

them were in use in the old station, and are provided with triple main switches, but on the newer panels the equalizer switch is combined with the circuit breaker. A watt-hour meter is in circuit with each dynamo, behind the board, and Wurts' non-arcing lightning arresters are in use.

The track rails are of the girder type, 6 inches high, and weigh 65 and 84 lbs. per yard; they are carried on steel sleepers 10 feet apart, to which they are secured with clips.

The Falk cast-welding system has been adopted for the rail joints on the new sections, as well as on a large part of the original tracks. The rails are cross-bonded with Chicago bonds.

Most of the new overhead construction has been carried out on the side bracket system, with center trolley; the arms are, therefore, very lengthy. The insulators are supported by bow-strings fixed in harps, which were designed by Mr. I. E. Winslow, chief engineer; one form of these is illustrated in Fig. 1. Rosette and side pole cross suspension is also used in places. The height of the trolley wire owing to bridges, etc., varies from 16 feet to 22 feet; to maintain an even pressure of the trolley on the wire over this wide range a special trolley standard, shown in Fig. 2, is used, the invention of Mr. Winslow. The illustration shows that in this type the springs are concealed in the body of the standard, with great advantage on the score of appearances; the leverage of the springs is made to depend upon the slope of the trolley pole by means of a cam of suitable shape with the result that the upward pressure is the same in all positions of the pole. A castiron "bonnet" is used to keep the standard rain-proof, and the rotating parts, as well as the pivot of the trolley pole, are mounted in ball bearings; electrical connection is maintained by means of a spring contact in the base of the standard. The whole arrangement is extremely neat and compact. It is fixed near the center of the roof of the car, one seat being omitted to provide space for it.

The trolley wire is of hard drawn copper, 0.32 inch diameter, and is double in most parts of the system. It is supplied by feeders laid underground in the town, but carried on the poles in the open country. There are three feeders of 0.24 square inch cross section, 300, 1,900 and 1,300 yards in length, and one feeder of 0.5 square inch, 1,200 yards long. There are no insulated return feeders, but the rail return from the old line, five miles long, is supplemented by old rails laid four in parallel and jointed with plastic bonds.

There are two six-track car sheds, capable of accommodating 12 and 15 cars respectively. One of these is operated with transfer tables, but in the newer one points and crossings are in use. A well-equipped repair shop is annexed to the larger shed, where all sorts of repairs are carried out; cars are rebuilt, armatures rewound, wheels forced on axles, and trued up by means of a car wheel grinder. The latter is fixed below the floor level, so that a car can be run into position and its wheels ground true with corundum grinders with a minimum of time and labor. Amongst other machines in this shop are two screw-cutting lathes, two drilling machines, hydraulic wheel press, shaping and screwing machines, and wood-working tools, driven by a 5 and a 10-hp, motor.

The cars are of various sizes, all double-deck: each car weighs 5½ or 6½ tons empty, is mounted on the Peckham truck, and is fitted with two 20-hp motors. The gear is of steel, with a ratio of 4.61 to 1. The maximum running speed is

<sup>\*</sup>From the "Electrical Review." London.

10 miles per hour, and the schedule speed 6 miles per hour. To ensure efficient service, a bonus of £1 every four months is granted to every motorman and conductor who has had no accident, and whose conduct has been satisfactory.

# A NEW TELEPHONE SYSTEM FOR PARTY LINES.\*

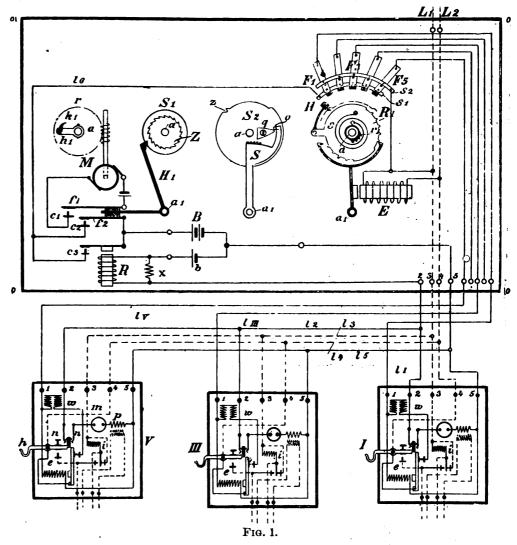

BY JUL. H. WEST.

Telephone party lines have the purpose of cheapening the use of the telephone for that class of subscribers whose number of daily conversations is limited. The duration of an average conversation is about 2.5 minutes, and the average number of daily conversations per subscriber is, in England, about eight; that is to say, an ordinary subscriber in England uses his telephone 16 times per day, and each time for 2.5 minutes—i.e., 40 minutes per day. The duration of the daily service being generally 15 hours, the line and apparatus of an ordinary telephone subscriber is in use only 5 per cent. of the allowed time. The best way to cheapen the use of the telephone is to have the telephone system more intensely used. If three subscribers, A, B and C, use their lines only 5 per cent. of the daily time, if we connect them to the exchange by means of one common party line, this line will be in use 15 per cent. of the daily time of service. It is clearly understood that the telephone company can give a telephone service to the subscribers on such lines cheaper than if every subscriber has his own line.

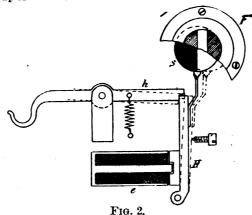

As in the instance chosen the daily speaking time on the common line is only one-seventh of the daily time of service, it will seldom occur that the telephone will be engaged by one subscriber when one of the other subscribers wishes to use it. Of course this will happen sometimes, and then the second subscriber must wait until the first subscriber has finished his conversation. This is the only inconvenience of the new system of common party lines, and as compensation for this the subscribers on the new system enjoy a reduction of 30 to 60 per cent. on the ordinary telephone rates.

The system invented by me and described in the following paragraphs allows the telephones of two, three, four or five subscribers to be connected to the exchange by one common party line. A small alteration in the construction of one of the apparatus used would allow a still greater number of telephones on one circuit. A diagram of the system is shown in Fig. 1. The system contains a small central apparatus, O, O, O, O, and the telephone apparatus of the different subscribers, of which only three-I, III, V-are shown in the diagram. The central apparatus is connected to the exchange by means of the common line, which can be either a double wire, L<sub>1</sub> L<sub>2</sub>, or a single wire, L1; in the latter case the other wire, L, must be earthed. These two wires L, L, and two other wires l, l, branch out to all the subscribers' telephones; besides that, each of these is connected to the central apparatus by means of a special wire li, liii, lv. These wires being rather numerous, the system is mainly designed for such cases where the subscribers of one party line are in the same building. The central apparatus may be located in any suitable place in the building, preferably beside the telephone of any one of the subscribers. The batteries of the whole system, containing seven accumulators, are placed together at the side of the central apparatus.

As soon as one of the subscribers takes his telephone from the hook, all the other subscribers' stations on the same line are immediately "locked" so that none of the other subthen H prevents h from moving downwards. In Fig. 1, in the subscriber's station, h is the switch hook, c is the electromagnet just spoken of, m is the microphone, p is the primary of the induction coil, i is the magneto-generator, and w is the bell. When subscriber V takes his telephone from the hook, he at once inserts his two telephones (not shown in the diagram) and

scribers can hear the conversation or disturb it; and similarly, when the exchange rings up one of the subscribers, all the stations on the line are locked at once, and immediately afterwards—by means of the central apparatus—the one station which is to be rung up is "unlocked" and its bell inserted in the

circuit, so that the subscriber may be called without any of the other subscribers being disturbed.

The locking and unlocking device is shown in Fig. 2. At the end of the telephone switch hook his the armature lever H of an electromagnet, e. When e attracts its armature,

the secondary of his induction coil in the circuit of L, L, and at the same time he closes the microphone circuit by way of the two springs n n; in this circuit is the battery b and the relay R. To prevent the self-induction of R having any influence on the microphone current, R is shunted means of an inductionless resistance, x. When R attracts its armature the circuit of the locking battery B is closed at ca; therefore it sends a current by way of c, l, into the contact plate s,, and from this into the five springs F<sub>1</sub> F<sub>5</sub> bearing against it and over the wires  $l_{\rm I}$   $l_{\rm V}$  to the binding posts 1 of the subscribers' stations, through electromagnet e, to the binding posts 5, and then by way of the wires l<sub>s</sub> back again to the battery. In consequence the electromagnets e attract their armatures, thus locking all the stations except station V, where the hook h had already turned down before e could attract its armature.

Subscriber V can now in the ordinary way ring up the exchange, while the other stations are locked. In connection with the locking lever H (Fig. 2) is a signal disk, s, which appears behind a small window, F, in the box of the stations, and indicates whether the line is busy or not. In the first instance the white and in the second case the black part of s is visible behind the window.

When the exchange calls one of the subscrib-

<sup>\*</sup> From the "Electrician," London.

ers, it sends, according to his number on the line, one, two, three, four, or five short impulses of current which pass through the electromagnet E of the central apparatus. The construction of the central apparatus is shown in Fig. 3 in longitudinal and cross sections and in plan, while in Fig. 1, within the lines O, O, O, O, the different parts are shown in detail, together with their connecting wires. apparatus contains two spindles, a, a<sub>1</sub>. On a is fixed a small arm, h1, with a movable ratchet k1; the latter works in a toothed wheel Z; this wheel and the two disks S1 S2 are fixed together and turn freely on the axis a. This is also the case with the toothed wheel R<sub>1</sub>, in the teeth of which works a pinion pivoted on the spindle, a,, and carrying the armature of the electromagnet E. Fixed together with R, is a partly toothed wheel r, which works in the partly toothed segment S pivoted on the spindle a1. The spiral spring s is fixed with its inner end to R,, while its outer end is fixed to the bearing plate above the spindle a, so that it tends to turn R<sub>1</sub> and r<sub>1</sub> in the direction of the hands of a watch.

When the central office sends, say one impulse of current, the pinion carrying the armature of E releases the toothed wheel  $R_1$  by one cog, so that the hammer H, pivoted on an arm of  $R_1$ , will be opposite to the contact spring  $F_1$ . In moving forward the hammer resting in the slot z of the disk  $S_1$  turns with it  $S_2$ ,  $S_1$ , Z; in the normal position the upper end of the two-armed lever  $H_1$  rests in a slot of the disk  $S_1$ . Therefore, when  $S_1$  turns, it turns the lever

spring from the lower contact rod  $s_1$  and presses it against the upper contact rod  $s_2$ . By this movement of  $F_1$  the locking circuit of the subscribers' apparatus I is interrupted, and the bell w is at the same time inserted in the circuit of  $L_1$   $L_2$  leading to the central office. The apparatus I is thus unlocked, and the subscriber may be rung up by the office in the

 $r_1$   $R_1$  in the contrary direction to the hands of a watch until H reaches the small slot z of the disk  $S_2$ . Immediately afterward q releases the projection o, thus allowing  $r_1$   $R_1$  to move again a small distance in the direction of the hands of a watch until  $R_1$  is stopped by the pinion. During the last part of  $R_1$ 's travel H has turned with it  $S_1$ ,  $S_2$  until  $H_1$  has fallen into the slot of

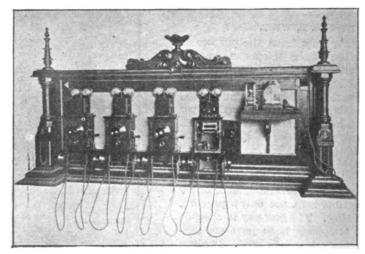

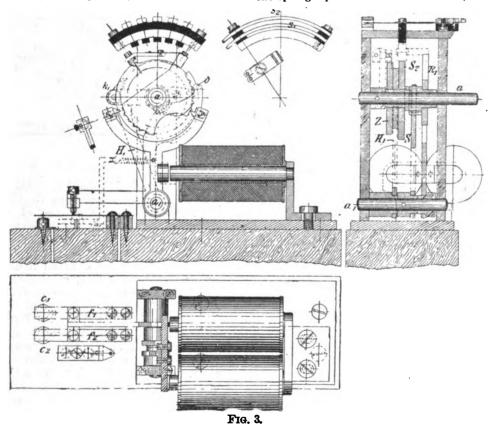

Fig. 4.

ordinary way, while all the other subscribers' apparatus are locked.

This state lasts until disk  $S_2$  has turned about three-fourths of a revolution when the hammer  $H_1$  falling into the larger slot of disk  $S_2$ , the spring  $F_1$  returns into its normal position,

 $H_1$ , the lower arm of which carries two contact springs  $f_1$   $f_2$ , which close the circuit of the small electromotor M and the locking circuit of the battery B referred to above. Thus all the subscribers' apparatus are locked at once. The electromotor M turns the spindle a slowly (one revolution in about two minutes) by means of an endless screw and a toothed wheel r. The arm  $h_1$  and ratchet  $k_1$ , force Z,  $S_1$  and  $S_2$  to follow the revolution of a; thereby  $S_2$  presses the hammer H outwards, and this touching an ivory piece fixed to the spring  $F_1$ , lifts the

thus disconnecting the bell wagain and locking the station I. The subscriber must therefore answer the ring within 1½ minutes, a time which is perfectly sufficient under any ordinary circumstances.

A short time after the hammer H has fallen into the larger slot of  $S_2$ , the small triangular shaped piece of metal q fixed on disk  $S_2$ , reaches the projection o of the segment S, which by the movement of  $R_1$   $r_1$  has been moved to the left, and presses it back again to the position shown in the diagram. Thereby S turns

S1, whereby the circuit of the motor M and the locking circuit have been interrupted. Now the normal position of the apparatus is reached, all the subscribers' stations being unlocked. This unlocking will not take place if the subscriber I answers the ring in due time; in this case the other stations will remain locked by means of the relay R until the subscriber I has finished his conversation. Instead of having one induction coil in each of the subscribers' stations one common induction coil for all stations may be used; then X will be the primary of this coil, while the secondary will be inserted in the wire L<sub>1</sub> between the connection with the electromagnet E and the binding post 3.

Fig. 4 shows the central apparatus and four subscribers' stations fixed together on a panel.

The diagram, Fig. 1, shows clearly that, otherwise than the ordinary contacts of the telephone hook, there are no movable contacts in the speaking circuits, and the function of one apparatus does not depend upon such contacts in the other apparatus. This is one of the advantages of the new system, as movable contacts are the most frequent cause of disturbances in telephone apparatus. The central apparatus alone contains a limited number of movable contacts, which are, however, all in the local circuits of the system. If any disturbance occurs through these contacts-or through any other cause—the result will never prevent the calling up of the central office. From the description the central apparatus may seem to be complicated; nevertheless its construction is most simple and not likely to get out of order. Another advantage of the system (one which renders it extremely easy of adoption) is that no alteration whatever of the boards at the central office is necessary.

The new system has been thoroughly tested by the post office of the German Empire, and is to be introduced very shortly into the German public telephone service.

The citizens of Elkader, Iowa, voted on Tuesday, February 13, to grant a franchise for an electric light and power plant to Messrs. Schmidt Bros. & Co., of that city. The power will be furnished by turbine wheels together with a reserve steam plant. Mr. H. L. Griffith, of Elkader, Iowa, is acting as consulting engineer and will prepare the specifications.

### OUR PARIS LETTER.

(Special Correspondence of Electricity.)

# Electric Lighting at the Paris Exposition of 1900.

The buildings of the Paris Exposition are approaching completion, and none too soon, as the inauguration takes place in two months. Despite this advanced state of affairs it is difficult to give a detailed report of the electric equipments; it will be necessary to wait another month—for the classification of exhibitors—before precise facts can be secured. All the reports published so far by the reviews are only general remarks regarding exhibitors, the placing of dynamos, switchboards, etc. The exhibitors' lists must be closed before definite information is accessible.

It was only a few days ago that the administration informed contractors of the conditions governing electric lighting distribution in the different sections of the Exposition. There evidently will be a great light installation, for arrangement is being made for 15,000 hp. to feed arc and incandescent lamps. This figure, considered as a basis, will certainly be exceeded without any difficulty, as the exhibitors of electric generating apparatus are numerous and they are perfectly well supplied with equipments to answer all the requirements of the electric lighting service, while private illuminating equipments moreover will complete the general installation.

As far as the public electric lighting, properly speaking, is concerned we are able to give figures from which the whole may be rightly estimated. Visitors coming at night will be admitted to the Exposition through the monumental entrance on the Place de la Concorde. They will find on the Champs Elysees 174 continuous current arc-lamps supplied from underground conduits. At the Porte de la Concorde there are 12 large arc-lamps on the cupola of the arch and on the minarets, while 8 projectors and 16 single reflectors are arranged on the turrets, not mentioning the 3,116 incandescent lamps which are distributed everywhere about the arch, Alexander III Bridge will be illuminated by 508 incandescent lamps distributed on the candelabra, on the luminous crowns, on the key-stones of the vault and on the quay-turrets. All these lamps are 16 candle power each, supplied by threephase alternating current generated in the transformer underground stations. On the Champ de Mars, the Palace of Electricity and the Chateau d'Eau (water castle) which face the above monumental arch, will necessarily be illuminated a giorno (as brilliant as day), the former one by 5,000 incandescent lamps, 8 arc lamps with projectors of stained glass and 4 arc-lamps with reflectors, and the latter by 2,000 incandescent lamps. The distribution for all these arrangements has been the subject of deep studies, and the effect produced will never be forgotten.

We must now mention the great banquet hall in the center of the former machinery palace, which is illuminated by 4,500 incandescent lamps; the two palaces of the Esplanade des Invalides, each of which will be illuminated by 1,070 incandescent lamps, and a central passage way between them is to have 25 arclamps while there are 34 in the quincunx, which makes a total of 2,156 lights. These are about the main features of the electric lighting, but there are others of less importance distributed in smaller groups in different localities. We hope to give you soon the general

distribution of the current and the arrangement of the different power stations about the circumference of the Exposition.

#### THIRD RAIL PYROTECHNICS.

# An Unusually Brilliant Display Furnished by the Elevated Motor Cars During the Heavy Storm.

The heaviest snow storm since the blizzard of last year arrived in New York on Saturday morning and continued throughout the day and night. The traction companies were busy with their snow plows and sweepers, and the trolley lines were all kept running, although about eight inches of snow had fallen.

One of the features of the storm was the brilliancy of the display on the third-rail system now in use on the elevated railroads. The "Brooklyn Eagle's" electric reporter furnished the following description of the third-rail display on the Fifth Avenue Railroad of Brooklyn:

"It is not often that the mystic force which propels the cars through the system of motors and copper wires lets itself loose. Usually the brushes which take up the power from the third rail, as the pulley of the trolley pole on the surface lines collects the propulsive current from the overhead wire on the surface lines, proceed with noiselessness and no spectacular attraction. But last night it was different. The lightning leaked from the third rail and whenthe brush came along made a great deal of fuss in dissolving itself, if it is ever dissolved, into the air. The result was that the passengers on the trains on the elevated were treated to a very pretty and to some a very alarming sight. As the brush passed over the third rail there was an electrical display that frightened many of the women in the cars.

"At street crossings, where there was little light, the sputter of brilliant blue and white sparks from the brushes and the third rail lit up the interior of the cars in a way that suggested to the timid that a storm of an unusual character had broken loose. There is always nervousness in some minds over a blinding snow storm, but when the murkiness of the atmosphere is lit up in a startling way with an unusual light there is added cause for fear.

"In the elevated cars there were fitful flashes of brilliant light which sparkled on the windows and cast showy reflections on the advertising boards on the sides of the cars. Many women were frightened, but there was really no reason for alarm. The spectacle was much better appreciated by persons on the street who looked up and saw the rain of sparks than by those who were in the cars.

"The snow formed a filmy covering to the third rail and as the brush of the motor came along it swept the white covering off in a shower. It was like the shower of steel filings in the golden rain of the pyrotechnist, only vastly more brilliant and dazzling. Of course there was no danger at any time and the only losers were the railroad people who had to supply the spent leakage from the rails with added power.

"This was the heaviest snow fall since the third rail system was put into effect and the passengers were not accustomed to the unusual experience."

experience.

"The newspaper readers, especially, were the most annoyed and many of them were obliged to lay aside the favorite journals because at periods all the lights in the cars would go out for a moment or so. The display to the people resembled the almost incessant lightning which usually accompanies a heavy electrical storm in summer. The trains were delayed little in consequence of the snow."

#### LEGAL NOTES.

The Appellate Division of the Supreme Court gave judgment a short time ago in favor of the North River Electrical Light & Power Company in its suit against the City of New York upon an agreed statement of facts, to recover about \$120,000 for furnishing light in the streets of the Borough of the Bronx from January 1 to September 30, 1899. The opinion was given by Justice O'Brien, Presiding Justice Van Brunt and Justice Patterson concurring. Dissenting opinions were given by Justices Ingraham and Rumsey.

Mr. J. K. Newman, president of the New Orleans & Carrollton Railway, and Mr. R. M. Walmsley, president of the Traction Company's lines in New Orleans, were each fined \$10 in the Second Recorder's Court recently for violation of city ordinance No. 13,838. The ordinance is the municipal act compelling the street railway companies to put their feed wires underground. In each case an appeal bond was taken and the validity of the law will be fought in the higher courts.

J. Austin Williams was given a verdict last week for \$6,000 by a jury in the Essex Circuit Court of New Jersey in his suit for \$10,000 damages against the North Jersey Street Railway Company for injuries received on January 31.

# Puzzled by an Electric Display.

To the Editor of ELECTRICITY.

SIR: Probably some of your readers would enlighten me as to the cause of the following electrical display: On the night of Jan. 24, while walking along a country road, I noticed sparks, apparently coming from a gable of a house. Thinking to prevent a possible fire, I notified the inmates, who, upon investigation, found that the sparks appeared on the point of a lightning rod; the lightning rod system contained five points, but the sparks appeared only on one. I am unable to account for this, as the night was clear (bright star-light at the time), there are no wires on that side of the road and only ordinary electric bells in the house. I again saw the same thing on passing the house two hours later. Yours respectfully,

New York, Feb. 7, 1900. D. W.

[Probably other readers of ELECTRICIY witnessed the same display, and we invite them to send us their views of it for publication. Such accounts are always interesting to readers of electrical papers.—Ed.]

# Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended February 10:

Antwerp, 4 cases, \$973: Argentine Republic, 141 cases, \$15,221; Australia, 15 cases, \$420: Brazil, 74 cases, \$3,666; Bristel, 8 cases \$2,500: British Possessions in Africa, 10 cases, \$256: British West Indies, 16 cases, \$5,750; Central America, 2 cases, \$30; Ecuador, 93 cases, \$5,000: French West Indies, 19 cases, \$1,694: Glasgow, 24 cases, \$1,640; Hamburg, 307 cases, \$25,900; Havre, 140 cases, \$10,125; Naples, 1 case, \$48.

## PERSONAL MENTION.

Mr. John Q. Brown, formerly secretary and acting manager of the Columbus (O.) Electric Company, has accepted the position as general manager and purchasing agent of the Electric Street Railway Company of San Antonio, Tex.

Mr. Thomas Rodd, chief engineer of the Pennsylvania Steel Company at Pittsburg, and consulting engineer of the Westinghouse interests, sailed for Europe a short time ago taking with him the plans for the new plant of the British Westinghouse Company at Manchester England.

Mr. John J. Cummins was recently elected general manager of the Syracuse (N. Y.) Electric Light Company, and the Gas Company. It is stated that the consolidation of the two companies is sure to come in time.

#### COMMERCIAL PARAGRAPHS.

The Chicago Fuse Wire & Mfg. Co. have just issued their Fuse Wire Catalogue No. 11. This booklet is of convenient pigeon hole size and is gotten up in neat style, as is customary with this company. Attention is called to the fact that they have made some additions in this issue, in the way of information about their line and method of packing, and have included extracts from the rules of the National Board of Fire Underwriters relating to the use of fuse wire and links. The product of the Chicago Fuse Wire & Mfg. Co has been well and favorably known for many years. Their goods are sold through the prominent jobbers and dealers in electrical lines. The Catalogue No. 11 will be sent free to all applicants.

#### Universal Junction Boxes.

In the wiring of buildings for electrical illumination, transmission of power, etc., there are many conditions that necessitate the use of individual junction boxes constructed especially for such emergencies. The latest invention, and one best adapted to all purposes, is the Universal Junction Box, just brought out by the Sprague Electric Company, and

or ceiling by a screw or nail, without the danger of being broken by a false blow. In fact, it would be impossible to break it in such a manner.

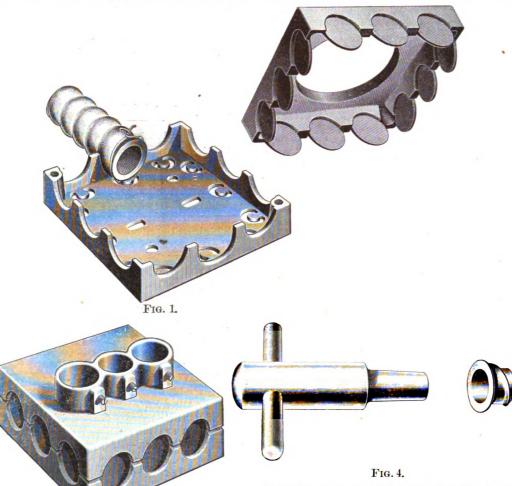

Fig. 4 shows the new lead bushing and expanding tool which the Sprague Electric Company is now making, The bushing has a thread cast on the outside and can be screwed into the end of the pipe and then expanded by inserting the expanding tool and giving it a few short twists to the right and left, but never turning it completely around.

### INCORPORATIONS.

The Edison-Johnson Electrical Manufacturing Company, New York City—to deal in electrical apparatus. Capital stock, \$75,600. Incorporators: T. A. Edison, Jr., E. G. Johnson, both of New York City, and W. A. Elliott of Cornwall, N. Y.

The Home Electric Street Railway Company, Kansas City, Mo. Capital stock, \$50,000. Incorporators: B. Corrigan, R. Gentry and J. Perry.

The Merchants' Light, Heat & Power Company, Youngstown, O .- to furnish are and incandescent light, heat and

power; to purchase and sell electric supplies and to carry on a general electric contracting business and other things incidental thereto. Capital stock, \$55,000. Incorporators; Henry F. Kaercher, David F. Anderson, George E. McNab, William R. Beard and Paul C. Kaercher.

The Cheatham Electric Switching Company, Louis ville, Ky.-to manufacture and sell a patent electric switching device for railroads. Capital stock, \$70,000. Incorporators: A. B. Cheatham, Peter Arlund, C. P. Todd and H. T. Sutton, all of Louisville.

The Manhattan Light, Heat & Power Company, St. Paul, Minn.—to manufacture and sell electricity and steam. Capital stock, \$1,000,000. Incorporators: L. L. C. Brooks, A. W. Zahn and F. C. Nelson, all of St. Paul.

The Citizens' Electric Light, Power & Heating Company, Dayton, O. Capital stock, \$200,000.

The Mount Pleasant Electric Company, Mount Pleasant, Tenn. - to manufacture electricity, etc. Capital stock, \$15,-000. Incorporators: E. L. Gregory, O. Ingram, J. G. Ingram, H. D. Rahm and J. Rahm, all of Nashville.

The Morgan Engineering Company, Alliance, O.-to manufacture hydraulic, electric, pneumatic, gas and fire machinery, including guns and ordnance. Capital stock, \$3,000,-

The Novelty Machine & Electric Company, Wheeling, W. Va.-to manufacture and deal in typewriters and typewriters' supplies. Capital stock, \$50,000, Incorporators: R. E. Schubert, C. Menkemiller, G. E. Kumer, H. G. Friedrichs, A. H. Wiedebusch, all of Wheeling.

ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subjert as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 503-504, Broadway, New York City. N. Y., or 639 F street, N.W., Washington, D. C.

Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED FEBRUARY 13, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

643,199. Car-Fender. Edward N. Porter and Junius Barnes, Burlington, Vt. Filed April 13, 1899.
643,276. Electric Traction-Motor. Charles Richter and Richard T. Eschler. Camden, N. J., assignor to the Security Trust and Safe Deposit Company, trustee, of New Jersey. Filed May 19, 1899.
643,491. Electric Flashing Switch. Ambrose L. Cotter, Cleveland, Ohio, assignor to E. L. Browne, same place. Filed Sept. 15, 1899.
643,591. Trolley. William G. Holmes, Roseville, and Henry Holland, Detroit, Mich. Filed March 31, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

643,413. Electromagnetic Variable-Speed and Clutch Gearing. Rankin Kennedy, Leeds, England. Filed Feb. 20, 1899.

1899. 643,442. Controller. Thorsten von Zweigbergk, Cleveland, Ohio, assignor to the Westinghouse Electric & Manufac-turing Company, Pittsburg, Pa. Filed March 31, 1899.

#### SIGNALS AND SIGNALING APPARATUS.

643,148. Electric Signal and Automatic Alarm for Railway
Trains. James K. Miller, Julius W. Witt, and Daniel A.
Jones, Oshkosh, Wis. Filed July 13, 1899.
643,255. Electrically-Operated Day and Night
Railways. John J. Saville and James H. Winspear.
Omaha, Neb., assignors to the Standard Railway Signal
and Switch Company, same place. Filed Aug. 13, 1898.
643,491. Pyroxylin Automatic Electric Fire-Alarm. Jehan De
Froment, Notre Dame de Lourdes, Canada. Filed July
25, 1899.

26, 1899. Railway Signal Apparatus, Charles R. Gur and Herbert Tomling. London, England. Filed Sept. 21, 1899. 643,609. Signalmg System. John J. Ruddick, Newtown, Mass., assignor to the United States Electric Signal Company, same place and Portland, Me. Filed Aug. 16, 1899.

# TELEPHONES AND TELEPHONE APPARATUS.

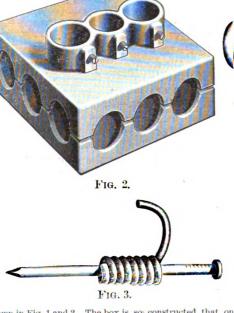

643,225. Telephonic Repeater. James Houlehan, Toledo, Ohio. Filed Sept 14, 1899. 643,399. Device for Disinfecting Telephones, etc. Warren H. Taylor, Stamford, Conn. Filed March 9, 1899. 643,545. Telephone-Telegraph. Alf Sinding-Larsen, Fred-riksvaern, Norway. Filed Aug. 22, 1899.

## MISCELLANEOUS.

riksvaern, Norway. Filed Aug. 22, 1899.

MISCELLANEOUS.

613, 133. Safety Device for Electric-Distribution Systems. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 3 1899.

shown in Fig. 1 and 2. The box is so constructed that one, two or more inleading conduits may be put in place by knock ing one or more tongues, making the requisite openings in the box. The bottom of the box has perforations permitting a wire to be inserted to tie the conduit in place while the work is in progress. This is a very important feature, and saves much time and expense.

These boxes may be applied either to ceiling or wall wherever a gas-piped passes through without the use of ceiling or wall blocks, or other means of attachment now ordinarily used.

The ceiling box, shown in Fig. 2, can be secured to the gas-

Fig. 3 illustrates a new type of pipe hook made by the same company, and has the advantage of being secured to the wall

# GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Abbeville, La.—H. P. Porter, secretary of a company recently formed here, wants 1,500 light dynamos, boiler and engine to suit, wires, lamps, etc.

Adairville, Ky.—The question of electric lighting is being considered here.

Centerville, Ia.-Law Bros. of this city have asked for a franchise to maintain and operate an electric light

Clearlake, S. D.—An electric light plant will be erected here this season.

Dalton, Ga.—J. M. Sanders, chairman of the light committee, wants estimates on the cost of an electric light plant for a town of 6,000 inhabitants.

Duluth, Minn.—The proposition to build a city electric light plant was carried at the recent election

Easton, Pa.—The question of erecting a municipal electric lighting plant is being discussed here.

Fairport, N. Y.—The question of building an electric light plant will soon be voted upon.

Freehold, N. J.-An electric lighting company is seeking a franchise here.

Hedrick, Ia.—The town council has under considera-tion the building of an electric light plant.

Ilion, N. Y.—There is a movement on foot that this village shall own and operate its own electric light

Index, Wash.—J. H. Mitchell and Harry Hoback have been granted a franchise by the Snohomish county commissioners to erect and operate an electric light plant in this village.

plant in this village.

Kingman, Kan.—An electric light plant has been planned for the salt mines near this place, for the purpose of lighting up the entire system throughout the building, inside the shaft and down in the mines, a thousand feet under the ground. A set of electric signals will be arranged to connect all the works, so that every department will be in instantaneous communication in case of possible accident or danger.

Knowilla Tana.—The Fact Wayne Flactric Com-

Knoxville, Tenn.—The Fort Wayne Electric Company will install a lighting plant here.

La Grande, Ore.—J. K. Ronig has lately made arrangements to double the present capacity of the electric light plant in this place.

Laurel, Miss.—The Kingston Lumber Company will rebuild its planing mill, and also put in an electric plant to run their mills night and day.

Lawson, Minn.—A new electric light plant will soon be erected here.

Little Falls, N. Y.—Isaac Lovenheim has asked permission to construct an electric light plant in Mill street and place poles if necessary for wires in Main, Mill, Albany, Second and John streets.

Loveland, Col.—A company is being formed here to build an electric light plant.

Madison, S. D.—The electric light plant at this place is to be enlarged to double its present capacity. About \$8,000 will be expended in improvements.

Newton, Kan.—The Santa Fe Railroad Company contemplates the erection of new electric light plants at Newton, Kan.; Albuquerque, N. M., and Winslow, Ariz. These electric light plants will furnish light, etc.

New Wilmington, Pa.—An election will be held this

week to wind the question of issuing bonds for an electric light plant. J. G. Martin is secretary.

Norristown, Pa.—The Norristown Electric Company will soon receive bids for erecting a new electric light

North Hempstead, N. Y.—The board of highway commissioners of this town has granted to the Roslyn Heat, Light & Power Company permission to erect poles and string wires along the town highways for the purpose of supplying light, heat and power to private and public consumers.

Plattsburg. Mo.—The citizens here are discussing the matter of buying the electric light plant.

Pleasantville, N. J.—The electric light committee states that they have considered the various propositions for lighting the borough and will submit them at the open town meeting for the consideration of the people.

Rayne, La.—A project is on foot by the business men of this place to erect an electric light plant and water works for this town.

Salisbury, N. C. —Bids will soon be asked for by this ity for erecting an electric light plant.

Sayville, N. Y.—There is a strong sentiment among the Sayville merchants in favor of establishing an electric light plant here.

Sonecs Falls, N. Y.—A mass meeting will be held here to consider the establishment of municipal waterworks and electric lighting system.

Shamokin, Pa.—Plans have been formulated by the Shamokin Light, Heat & Power Company for the erection of a plant here to replace the two now in operations

Thorntown, Ind.-The town board has decided to

submit the question of a municipal electric light plant at the regular town election in May.

Two Rivers, Wis.—The citizens of this place have voted in favor of waterworks and an electric light system. The estimated cost of the two plants will be

with about \$60,000.

Victor, N. Y.—If the proposed Canandaigua-Rochester electric road is built, efforts will be made to have this village lighted by electricity.

Washington, Ind.—The question of a municipal electric light plant is being considered by the committee composed of J. F. McGehee, chairman, and O. Wolf, with aleast of the control of the city clerk.

Waterloo, Ind.—This town is agitating the question of erecting an electric light plant.

Wayne, Mich.—This village is considering the advisa-lity of building a municipal electric lighting plant.

Wellesley, Mass.—A committee has been appointed to secure plans and estimates for a municipal electric lighting plant.

Wichita, Kan.—W. B. McKinley has been granted permission to build an electric light plant before July 1. Winston, N. C.-An electric light plant is to be erected here.

#### STREET RAILWAYS.

Adrian, Mich.—It is proposed to build an electric road from Toledo here. The Toledo & Western Company being the organization back of it. Seafraves Brothers are the promotors, and Adrian will be one branch of the main line which runs west from Toledo to Lyons, O.

Appleton, Wis.—The Fox River Valley Electric Railway Company has purchased the property of the Appleton Edison Electric Company, which includes an electric road two miles long and the entire city lighting system. The line will probably be rebuilt.

Atlanta, Ga.—A charter has been issued to the Atlanta, Roswell Electric Railway & Power Company with \$500,000 capital, to build a railway from this city to Roswell, a distance of about 20 miles. W. H. Harrison

Baltimore, Md.—The Maryland Electric Railway Company has asked for a franchise to build an electric line in the city and suburbs. Messrs. L. L. Strauss and A. P. Gorman are counsel for the company.

Battle Creek, Mich.—Geo. Bullis, representing the Detroit and Ann Arbor stockholders, has asked for a franchise from the common council for an interurban electric road to run between Hastings and this place.

Bloomsburg, Pa —The surveying for the electric railway between Danville and Berwick via this place has been commenced. B. F. Myers is the president of the company.

Chattanooga, Tenn.—The Bapid Transit Company of this city will soon build an electric line 4½ miles in

Cumberland, Md.—The Baltimore & Ohio Railroad Company has under advisement a plan to assist heavy trains up the 17-mile grade by electricity, and to do away with helping engines. It is thought the power will be generated here.

Denver, Col.—The Denver, Boulder & Northern Bailway Company is seeking the right to run an electric line in this city as well as one to Boulder.

Elyria, O.—This place will soon be connected with Mansfield by an electric road.

Hamilton, O.—The Camden council has granted a franchise to the Hamilton & Eaton Electric Street Railway.

Hubbard, O.—The Youngstown & Sharon Electric Railway Company wants a franchise through this place.

Milford, Mass.—A company has been organized for he purpose of connecting Milford, Upton and Grafton Mass.—A company of connecting Milford, Upton and Grane vio railway. The length of the line is to be the purpose of connecting by an electric railway. 12½ miles.

Omaha, Neb. -C. M. Searles, of Sidney, Ia., has been omans, Neo.—C. M. Searies, of Sidney, Is., has been negotiating with the commercial club and others for the construction of an electric railroad with the southern terminus at Hamburg, Is. The proposed road will run from Hamburg through Tabor, S.dney, Glenwood and Silver City. the intention being to connect it with Council Bluffs and Omaha. The road as planned will be about 50 miles in length.

Phoenixville, Pa.—A trolley line from this place to Bridgeport is the latest proposition in that method of travel. Several capitalists have called upon John L. Hay, through whose property at Valley Forge the road would pass, with a view of obtaining the right of way.

Pottstown, Pa.—The freeing of a large portion of the Perkiomen & Reading turnpike in Montgomery county lately is regarded as being the preliminary step toward building a trolley line connecting Norristown with this place, and eventually, Reading and Philadelphia.

Traverse City, Mich.—An electric road is now assured from this city to Northport, a distance of 30 miles. The company is organized as the Traverse City & Leelenan Bailroad Company, with a capital stock of \$300,000. The road will touch all the popular resorts in this section.

Troy, N. Y.—Surveys are being made for the new trolley line from this city to Williamstown. The road as now planned is 30 miles in length.

Warrensburg, N. Y.—The Warren County Railroad Company has been granted permission by the State board of railroad commissioners, to construct a trolley line from Caldwell to this place.

Warsaw, Ind.—A tranchise has been asked for by A. D. Biggs and associates to build an electric railway through this city from North Detroit.

West Orange, N. J.—Indications are that the Erie Railroad may adopt electricity for a motive power on its Orange branch between here and Forest Hill, and Orange and Maplewood Traction Company so that company will haul freight and probably coal into Orange Valley and South Orange.

#### COMPANY MATTERS.

Brooklyn, N. Y.—Last week the Brooklyn Navy Yard building, No. 7, was wrecked by fire. The damage to the electrical apparatus stored on the first floor was \$50 000.

Denver, Col.—The Avon Mining, Milling & Power Company will erect a 200 ton concentration works at Black Hawk, and put in an electric power plant of 1,000 horse power in addition to opening up a large number of properties that have been closed down for some time and developing new claims. The prime movers in the concern are: R. W. Cokell, of the American Exploration Company, H. L. Martin, C. L. Martin and others from the East.

Georgetown, D. C.—The Potomac Electric Power Company proposes to begin at an early date the enlargement of the steam electric plant, and to increase the plant by putting in two 3,000 horse-power machines.

Merrill, Wis—The Electric Rsilway & Lighting Company of this place, has a large amount of surplus power from the water wheels in the lighting plant, which is to be used in operating a pulp mill for the purpose of crushing pulp wood.

Milltown, N. J.—Fire recently destroyed the car-sheds. 22 cars and 2 sweepers of the Brunswick Trac-tion Company in this place.

New York.—The Cousolidated Railway, Electric Lighting & Equipment Company of this city recently purchased the plant of the hardware manufacturers, Wilcox & Howe of Ausonia, Conn., for \$15,000.

Port Clinton, O.—The new Tiffin, Toledo & Sandusky Electric Railway Company is preparing to erect a large power house at this place.

Santa Aua, Cal.—The Edison Electric Company will apply electricity to this place generated by Santa lara River power in the San Bernardino Mountains, 100 miles away.

Toronto, O.—The Toronto Electric Light & Power Company has ordered new machinery and will build a much larger plant in a new and more convenient location next to the ice plant.

Yardley, Pa.—The People's Electric Light Company of this place has sold its electric light plant to a party of Trenton capitalists.

## POWER AND TRANSMISSION PLANTS.

Atlantic City, N. J.—It is reported that the Delaware River & Atlantic Trolley Company has secured the old Colwell mill property, with the water power rights at Weymouth, Atlantic county, where it proposes locating a power plant, as it is claimed that sufficient power can be developed there to make all electricity needed for the road.

Pine City, Minn.—Recent transactions in real estate render it certain that the great water power at Cheng-watena dam will be utilized the coming season. This power is the most constant of any in the State. The power is the most constant of any in the State. The flowage of the dam covers an area of nearly fifty square miles, affording an immense reservoir. This power will be used to operate the electric light plant of this city, and also to furnish power for a new enterprise about to be started.

## AUTOMOBILES.

Cumberland, Md.—Swift & Company of this place are the owners of the first automobile seen on the streets of Cumberland. It is used as a delivery wagon.

New Britain, Conn.—A scheme is well under way to run large automobiles, carrying twenty passengers, from this place to Hartford and from there to Union-ville. The capitalists interested in the matter have sent a committee to New York City to examine vehicles of different makes.

New York.—It is stated that the second lecture in the series being given on automobile topics, under the auspices of the Automobile Club of America was delivered a short time ago at the Waldorf-Astoria, by Mr. A. L. Riker. The subject was "Electricity as Applied to Automobiles."—The initial trip of the new auto-ambulance of St. Vincent's Hospital was made last week, going from St. Vincent's to Bellevue Hospital. Dr. Farrell, of St. Vincent's Hospital, was in charge. The auto-ambulance can be geared to eighteen miles an hour. It can accommodate two patients exily.

Peterson N. I.—Members of the Union Transit New York.—It is stated that the second lecture in the

nour. It can accommodate two patients ewily.

Paterson, N. J.—Members of the Union Transit
Company say that the franchise has been given them
to operate automobile carriage service in this city.
Orders will be placed at once for the building of the
automobiles and it is expected to have a number of
them running in May or June at the latest. The
vehicles will be made in Connecticut.

# THE TELEPHONE WORLD.

#### Telephone War in Prospect.

There can be little doubt that Philadelphia is on the verge of one of the greatest telephone company wars that has ever been waged. Since the days when the great Bell Telephone Company gained a monopoly and began to pay immense dividen is there has been a constant effort made to wrest from them their ability to control the telephone business of the country, and the eyes of capitalists have been constantly upon the lookout for an opportunity to get in on the ground floor of this money-making enterprise.

In less than a year the last remaining patents of the Bell Telephone Company will have expired and then the war will be on in earnest. All through Pennsylvania small companies have started up and are already conducting their business under charters granted by the State. Others are seeking and obtaining charters. They are also selecting sites for the erection of suitable buildings to conduct their business, but they are apparently in no hurry to commence.

Those who are more familiar with the telephone business declare that these charters are obtained on a speculation basis only. That when the times comes for the Bell Telephone patents to expire some large concern will enter the field only to find that several small charters have been granted for cities, territories or States that they will first have to purchase in order to gain control of the business.

The officers of the Telephone, Telegraph & Cable Company of Pennsylvania, declare that they are in no way connected with the Inter-State Telephone & Telegraph Company, therefore, there are at least two rival companies already in competition for the control of Pennsylvania alone. Each company sets forth that they will not only control the lines of Pennsylvania, but those of the States adjoining, so that it is evident that a clash must come sooner or later. When it does the war will be a merry one, and afford one of the greatest fields for speculation yet offered, at least, this is the opinion of the knowing ones.

#### To Fight the Bell.

A meeting of the Interstate Telephone Association, comprising all the independent telephone people in southwestern Missouri and eastern Kansas, has been called to meet in Fort Scott on April 10 for the purpose of more thoroughly organizing against the Bell Telephone Company. A number of independent long distance lines are included in the association, and it is understood that arrangements will be made for better co-operation between these and also for securing a line to Kansas City. The nearest point to Kansas City on the independent long distance lines is Ottawa.

J. C. Duncan, general manager of the People's Telephone & Telegraph Company of Knoxville, Tenn., reports that his company does not propose to give up the territory in upper East Tennessee, beyond Morristown, to the East Tennessee Telephone Company, but that as soon as a new line can be constructed from New Market and Mossy Creek, the People's Company expects to re-enter that field with a better toll line service than they have ever had before. This statement indicates that there will be continued opposition between the two rival companies in upper East Tennessee territory during the coming spring and summer, possibly to a greater extent than ever before.

It is reported that the Bell Telephone Company has men at work obtaining the right of way for a new telephone line from Niagara Falls to Lockport, N. Y., through Sanborn, The average price paid for the right of way past each person is said to be \$1. A third of the right of way has been obtained between the Falls and Sanborn, and all but ten of the farmers between Sanborn and Lockport have given permission. Ten or more 'phones will probably be put in at Sanborn, with a central office at that place, and a branch will also be built to Pekin.

In the Assembly at Albany Mr. Prince, of New York, has introduced a bill to prevent the erection of any more telephone, telegraph or electric poles in cities of 50,000 inhabitants or over, except such as are now or may hereafter be erected and maintained in connection with an underground system of wires. The independent telephone men intimated plainly that the bill emanated from the Bell Company or its friends, and that it is purposely designed to handicap rival companies in New York City. The Bell Company largely controls the subways, and the bill would give it the exclusive right to maintain poles in the suburbs. The independent men, however, are not asleep, and they will take steps to head off the bill.

There is a possibility that the trouble between the retail druggists of Minneapolis, Minn., and the Northwestern Telephone Exchange Company may be arbitrated. Certain members of the board of trade have suggested that means of settlement, and it is understood that the managers of the telephone company will consider that side of the question.

#### Telephone Officials Confer.

J. M. Thomas of Chillicothe, Ohio, president of the Independent Telephone Association of the United States, was recently in consultation with Hugh Dougherty of the Independent Telephone Company and others interested in the Telephone, Telegraph & Cable Company of America.

Telephone, Telegraph & Cable Company of America.

"The Association is growing like a rolling snowball during a thaw," said Mr. Thomas. "The New York Company will build as far west as Cleveland, where it will connect with the Western lines. The Kinlock Company of St. Louis, the Illinois Telephone & Telegraph Company of Chicago, and practically all the independent telephone companies of the West will become a part of the Independent Telephone Association of the United States. When the deal is completed we will cover a large portion of the country, and have a system almost perfect in all its departments."

#### Sold to the Cumberland.

The People's Telephone Company of New Orleans has finally been sold to the Cumberland Telephone & Telegraph Company.

The stockholders, of whom there were only ten or a dozen all told, were principally Detroit men. Negotiations looking to this consummation have been under way for some time.

Those interested do not state what price they received for their stock, but admit that they made some profit on the investment. It is now stated that it is a matter of only a few days before the Detroit Switchboard Company will be sold to the same parties.

The price paid was \$425,000 for all bonds and stocks. This takes in everything, with the exception of \$110,000 bonds sold abroad. The Cumberland Company has agreed to take these at par whenever offered.

# Annual Meeting of the Central New York Telephone Company.

The Central New York Telephone & Telegraph Company held its annual meeting last week at the offices of the company in the Mann building, Utica. President Lewis H. Lawrence occupied the chair.

The president's report showed the following: The gross revenue for the year was \$251,060.93; the gross expenses were \$200.589.23; net revenue, \$41,471.70. Compared with the year 1898 this shows there was an increase of gross revenue of \$16,974.40; an increase of gross expenses of \$19,900.50; a decrease of net revenue of \$2,926.10.

The revenue from the toll lines shows an increase over 1898 of \$5,418.87.

The total number of exchange subscribers December 31, 1899, was 4,457, a gain of 444 during the year.

The usual annual dividend of 6 per cent on the issued capital stock was declared and paid quarterly.

A new telephone system will be constructed this spring to operate in Glens Falls, Sandy Hill, and Fort Edward, N. Y., having connection with Troy and vicinity, seventy five towns in Vermont and the towns west of Lake George. Charles W. Forbes of Chicago is at the head of the enterprise. The proposed capital is \$120,000. A franchise has been obtained from the village of Fort Edward and similar grants it is expected will be received from other villages. The new company will connect with other new companies which are being organized throughout New York State.

The Troy (N. Y.) Telephone & Telegraph Company have elected the following directors: George P. Ide of Troy, W. C. Humstone of New York, Charles A. Tinker of New York, William S. Earl of Troy, C. Jay French of Boston, Mass., C. H. Irwin. of New York, Alba M. Ide of Troy, James F. Cowee of Troy and Jeffries Wyman. The following officers were elected: President, George P. Ide: vice-president, Charles A. Humstone of New York; second vice-president, Alba M. Ide; secretary and treasurer, Herbert J. Richmond.

Papers have been signed transferring the franchise and plant of the Oshkosh (Wis.) Northwestern Telephone Company, exclusive of office fixtures, to the Erie Telephone Company of New York, representing the Wisconsin Telephone Company of Milwaukee. The Oshkosh company has 5¼ subscribers and it is understood the purchase price is about \$50,000. The Wisconsin Company will operate both exchanges for the present. The sale includes an agreement not to raise rates above \$24 and \$36 for five years.

The Chicago Telephone Company will, in accordance with the authorization of the shareholders, issue \$1,000,000 of new capital at par. One half is payable April 5 and the other half October 5. The old officers were re-elected, with Mr. John M. Clark president and Mr. Byron I. Smith vice-president,

# Congress' Aid Invoked to Break Up a Monopoly.

A strong effort is being made to kill the monopoly now enjoyed in Washington by the Chesapeake & Potomac Telephone Campany, which is controlled by the Bell Telephone Company. Congress attempted to regulate the prices to be charged by this company, and passed a law making the maximum rate \$50. A decision of the local courts declares this law inoperative, practically saying that the company can fix whatever prices it wants and Congress cannot interfere. A new company is now knocking at the doors of Congress for permission to enter into competition with the existing company. A bill has been presented for that purpose which has the approval of the District Commissioners. The name of the company is the Washington Telephone & Telegraph Company, and it agrees to give a service at the rate of \$36 per year for residence telephones and \$48 per year for business telephones.

#### New Telephone Line for Pittsburg.

The Pittsburg & Allegheny Telephone Company, the new concern which is to compete in Western Pennsylvania with the Bell Telephone monopoly, has secured the passage of an ordinance through the Allegheny Select Council by a vote of nine to five, permitting the company to operate on the north side of Pittsburg.

When the Detroit and New State Telephone Companies have been consolidated with the Michigan Telephone Company, the latter will have a great deal of property on its hands which it will be obliged to destroy. This will include the Detroit switchboard and about 12,000 telephones. Under its agreement with the Bell Telephone Company, the Michigan Company uses Bell instruments for which it pays an annual rental of \$1.50 each. This agreement forbids the use of any other instrument. The instruments that have been used cannot be sold to any other company, and the only thing to do is to burn them, and this will be done. An original investment of about \$60,000 will go up in smoke.

The Interstate Telephone & Telegraph Company of Allentown, Pa., which was lately incorporated with a capital stock of \$2,000,000 for the purpose of connecting local telephone companies in Pennsylvania, New Jersey and Delaware, has elected the following officers: C. W. Kline, of Hazleton, president; Dr. C. A. Eisenhart, of York, vice-president; A. M. Worstall, of Philadelphia, secretary; Major Thomas Daugherty, of Allentown, treasurer.

President Hill, of the Muskegon (Mich.) Independent Telephone Company, has signed a contract with Vice-President Pettengill of the Erie Telephone system covering the transfer of the Independent Company to the Erie system before the close of the month. The company operated 600 subscribers and the long-distance line connecting Muskegon with Grand Rapids and several other sections of Western Michigan. The financial consideration is not known.

After three years' efforts to get a franchise in Scranton, Pa., for a company to oppose the Bell Telephone Company, the select council granted a franchise to the Lackawanna Telephone Company, and it was immediately signed by the mayor. The officers of the company are W. J. Lewis, president; A. P. Bedford, vice-president; S. E. Weiland, secretary and treasurer; directors: Reese G. Brooks, ex-Mayor W. L. Connell and ex-Sheriff Charles Robinson.

A certificate of an increase of capital stock of the Bell Telephone Company, of Buffalo, N. Y., from \$2,000,000 to \$5,000,000 was filed last week with the Secretary of State at Albany. The debts of the company, it asserts, are not to exceed \$500,000. The certificate is signed for the stockholders by Sherman S. Rogers and William H. Watson.

The village trustees of Salem, N. Y., have granted a franchise to the Granville Telephone Company to erect and maintain a telephone system in Salem. The franchise provides that the permit shall not interfere with any other franchise already in force.

The Hampden (Mass.) Automatic Telephone Company has petitioned for a franchise throughout the county. Capital stock, \$300,000. The company promises a yearly rate to business houses not exceeding \$48, and to residences a rate not exceeding \$25.

A Tonawanda (N. Y.) paper warns the Bell Telephone Company if it does not get down to business and make a "substantial reduction of rates" it will get no franchise and "some other company will get the chance in North Tonawanda."

The capital stock of the Michigan Telephone Company is to be increased from \$2,500,000 to \$10,000,000.

# ECTRICA SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricaty from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 152@16c.; Lake, 16@16½c.; casting,  $15\underline{1}\underline{6}\underline{1}5\underline{7}c$ .

The Cauadian General Electric Company will issue \$300,000 additional common stock.

Senator Chris L. Magee of Pittsburg has resumed negotiations for the consolidation of every street railroad in Allegheny County, Pa.

The Buffalo (N. Y.) Traction Company reports for the quarter ended December 31 gross earnings of \$21,796, an increase of \$2,966, and net \$5,625, an increase of \$7.115.

At the annual meeting of the Hartford (Conn.) Electric Light Company the stockholders voted to increase the capital stock by 50 per cent., from \$700,000 to \$1,050,000.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Bat, 16 2019; New York Electric Vehicle Transportation, 81/29; New England Transportation, 6(264).

The Metropolitan West Side Elevated Railroad Company, of Chicago, has declared a dividend of 2½ per cent. on its preferred stock for the year 1899, payable February 28. This is the first stock dividend the company has declared.

The Michigan (Bell) Telephone Company, which recently absorbed various independent companies in Michigan, voted unanimously to increase its capital stock from \$2,500,000 to \$10,000,000. More than two-thirds of the stock was represented

At a meeting of the stockholders of the United Traction Company of Albany, N. Y., it was unanimously decided to increase the capital stock of the company from \$4,000,000 to \$5,000,000. Ten thousand shares at a par value of \$100 will be issued. \$3,000,000 worth of stock was represented at the meeting.

The Canadian General Electric Company has issued a circular, in which it states that a new issue of common stock to the amount of \$300,000 will be issued. The price of the issue will be decided upon at the annual meeting. The additional stock will make the total capital of \$1,200,000 in common and \$300,000 in preferred.

New York brokers are looking after proxies on the stock of the Electric Light & Power Company of Dolgeville, N. Y., for a vote to foreclose the mortgage held by the Trust Company. In their letters they say rents of lights at Dolgeville are too low and at Little Falls too high and that a mutual understanding between the two companies would be valuable to both.

The stockholders of the United Railways & Electric Company of Baltimore at their annual meeting re-elected the retiring board of directors. A statement given out by the company for the nine months ended Dec. 31, 1899, shows: Gross earnings \$3,402,200; operating expenses, including insurance, taxes, interest, \$3,359,863; net earnings \$42,337. The directors re-elected the present officers.

August Belmont's company, which will gurantee Mr. McDonald's Rapid Transit contract and make a profit out of the equipment and lease of the Rapid Transit Railroad, was incorporated Monday. It is called the Rapid Transit Subway Construction Company, of New York City, and has a capital of \$6.000,000. Cornelius Vanderbilt is one of the directors. The bond, it is said, will be filed on Saturday.

The strength in General Electric recently is attributed to buying for inside interests on the prospects of a tavorable showing which will be made in the annual statment. The fiscal year ended January 31 and although it will take some weeks to secure final figures it is reported the volume of business will be much greater than expected. It is stated that something over \$26,000,000 of business was probably transacted.

Directors of the Chicago Telephone Company have decided to issue within the present year \$1,000,000 of \$10,000,000 new stock recently authorized. That is the amount of money to be expended in 1900 in improvements and extending the company's plant. The stock will be offered to present holders at par in the ratio of one new share for every five now held. One half of the new stock is to be paid for by April 5, and the other half by October 5.

The Philadelphia Electric Company, in accordance with the consolidation agreement, has completed the purchase in the open market of \$2,000,000 Philadelphia Electric gold 5s. The purchase was made quietly, and with a view of preventing an advance in the price while the operation was in progress. The amount now outstanding is said to be \$11.200,000. The purchase of these bonds makes an annual saving in interest charges of \$100,000. It is understood that no more of the bonds will be retired.

Alexander Brown, of the banking house of Brown Brothers, of Baltimore, admits that a deal is pending looking to a consolidation of all the street railways of Pittsburg, and that it would probably be consummated. He said, however, that he was not yet at liberty to discuss the details of it. The properties involved are those of the United Traction Company, in which Baltimore men are largely interested, the Consolidated Traction Company and the Mellon system. These companies operate a total of more than two hundred and forty-six miles of track in Pittsburg, Allegheny City and adjacent towns. Mr. Brown represents the United Traction interests in the negotiations.

Consolidation of practically all the case and electrical business of New York City

Consolidation of practically all the gas and electrical business of New York City has been announced officially. The president of the Consolidated Gas Company, which is controlled by the the Rockefeller-Stillman party, in an address to shareholders said that the company had bought every electric light, heat and power company in operation or having a franchise in Manhattan and Bronx boroughs and in Yonkers. The price paid was \$36,000,000 and a debt of equal amount was assumed, making the price paid for the New York Gasand Electric Light, Heat and Power Company's properties equal to \$72,000,000. Besides this, the Consolidated Company has acquired four other companies. Their cost, together with the price paid for the nower company's securities, makes the total outlay for the business of Manhattan, Bronx and Yonkers about \$89,000,000. This purchase, therefore, gives to the Rockefeller Stillman party a practical monopoly of the gas and electric light, heat and power business in the territory named.

Third Avenne Railroad (New York) stock is awinging around in staggering ways

Third Avenue Railroad (New York) stock is swinging around in staggering ways in Wall street and is now below par. How the creditors of the road are to be satisfied now that the syndicate of bankers headed by Kuhn, Loeb & Co. have refused to finance the \$17,000,000 floating debt, is a question which is harassing the directors. But it is causing more uneasiness among those to whom the road owes money. The bankers became disgusted with the dilatory tactics of the Third Avenue officials in coming to terms. They became convinced that the directors were using the negotiations for stock-jobbing purposes. Third Avenue stock would fluctuate in harmony with the supposed progress of the refunding scheme. Wall street was led to believe that the matter was practically settled. Therefore the announcement of the syndicate's withdrawal caused great surprise and some dismay. The financial writer of the New York "Times," referring to the above trouble, says: "A corporation keeping its affairs in secret, and in the face of such conditions disbursing dividends to shareholders (who thus might be persuaded that prosperity was attested), is a corporation—not well managed.

# EDITORIAL NOTES.

"Why Not Investigate?"

During the meeting of the League of American Municipalities, held at Syracuse, N. Y., last

September, a proposition was made to the League by the National Electric Light Association to make a thorough investigation of the question of municipal ownership of quasipublic corporations, and offered to pay one-half the expense (the total expense not to exceed \$5,000) for the employment of a competent expert to examine as many municipal electric light plants as the above sum would permit. the properties to be examined to be selected by the League of American Municipalities, and said expert to be selected by the president of the National Electric Light Association and approved by the president of the League, the result of such examination to be in the form of a report, sworn to before a notary, in duplicate, one copy of which was to be furnished to the League and one to the National Electric Light Association.

The League of American Municipalities accepted the offer on the following conditions:

"First—That the president of this League appoint one investigator, and the president of the National Electric Light Association another, these two with any needed assistants, to investigate jointly and report on all points of agreement and disagreement.

"Second—That the investigation extend to the charges for domestic, commercial and street lighting, the cost of coal, the wages and hours of labor in private companies whose conditions are as similar as may be to those of the public plants examined. The presidents of the two Associations, in conference with their expert investigators, to select the plants to be examined, both public and private. In case of disagreement on this point, half of the public and half of the private plants to be selected by each president.

"Third—That in view of the regular dues of the Association being inadequate for even ordinary running expenses, the money for this investigation shall be secured by our treasurer from special donations, and our acceptance of the offer under consideration shall be conditional on the raising of this money, for which end we hereby request all those interested to contribute liberally."

The officers of the National Electric Light

Association acquiesced to all the stipulations made by the League and even offered to pay the entire amount required for the investigation, but up to this time no steps seem to have been taken by the League to push the matter to a conclusion, and we were not surprised to find the following editorial, under the caption "Why Not Investigate?" in the last issue of "City Government":

"The National Electric Light Association will meet at Chicago on May 22, 23 and 24. In the meanwhile it behooves the League of American Municipalities to take some action upon the challenge of the Electric Light organization to join with it in an expert examination of the results of municipal ownership of lighting plants. This challenge was offered at the Syracuse convention of the League, where it was accepted with the understanding that the proposed investigation should be carried on by two experts.

"So far as our observation reaches the League has made no effort to raise the funds for the investigation, while the Electric Light Association has not only secured its half of the money, but stands ready to furnish the entire \$5,000. In other words, the electric light people are prepared to contribute to the League its share of the expense of the proposed investigation.

"Considering that the Electric Light Association is composed of parties having large financial interests involved in the question proposed for investigation, and that the results of any such investigation would be of great value to these parties, it seems entirely proper that they should bear the expense, which they are willing to do.

"The League can in no way prejudice its case by accepting an offer from the Electric Light Association to furnish all of the funds necessary for the investigation, in case such an offer is made unaccompanied by any embarrassing conditions. It matters not where the money comes from so long as the League is left free to appoint one of the two investigators and exercise an equal and unprejudiced hand with the Electric Light Association in the conduct of the investigation.

"Many of the mayors and other city officials who were present at the Syracuse meeting of the League when the proposition of the Electric Light Association was submitted, regarded it as a 'bluff.' Now after the lapse of five months, we find the electric light people still talking and the League silent. The officials

of the Electric Light Association publicly announce their willingness to have the investigation go on at their expense. If this is a 'bluff,' it should be promptly called.

\* \* \*

# The "Panheliomotor."

From time to time mention has been made in these columns of various at-

tempts to utilize the heat of the sun, in lieu of coal or other fuel, for power purposes Such men as Herschel, Ericsson, Nikola Tesla, and others of less note, have tried their hand at it, but as nothing tangible has come of it, it is to be presumed the devices thought of proved too complicated for practical purposes. In a recent issue of the New York "Herald" there appeared a description of an apparatus for utilizing the heat of the sun, invented by a resident of Washington by the name of Dr. William Calver. In an interview, with a representative of the paper already mentioned, Dr. Calver said:

"I believe, in fact, I know, that I have solved the problem of the direct conversion of the sun's rays into a heat which can be utilized on a far cheaper commercial basis than coal. I feel that beyond a doubt I have settled forever the question of the actual commercial harnessing of the direct rays of the sun and of their adaptation to the needs of man.

"There is no limit to the intensity of the heat which I can generate. With the concentrated rays of the sun collected against a mountain side I could melt the rocks and cause the earth to burn like a living volcano. I can produce in one spot a heat vaster and more fierce than that on the face of the sun itself, and a greater heat than any now attainable through the combustion of known substances or through the agency of the electric arc, which now furnishes the fiercest heat known to man,"

The apparatus by means of which the inventor claims to be able to produce a heat exceeding that of the electric arc consists of a movable framework of small flat mirrors, so arranged that one or all can be made to focus the rays of the sun on a given point. This collection of mirrors he calls a "panheliomotor," and refers to it as follows:

"Each of the small flat mirrors is attached to a simple gearing device by which it can be moved at pleasure. Each or all of these little surfaces can be concentrated on a very small surface at any desired distance. In practice they are concentrated on a reservoir."

Commenting on the value of the frame of mirrors as a heating agent Dr. Calver said:

"Now, as to the exact value of the frame before us. I have estimated that each mirror, four by six inches, reflects a heat equal in the course of a year to that generated by the combustion of a hundred pounds of the best anthracite coal. Therefore the frame before us is about equal each year, in heat giving power, to forty tons of the best coal. This is more than the actual cost at which the frame could be constructed. It must be remembered that this frame is only an experimental one, having a reflecting surface of only about one hundred and thirty feet. Upon this model, structures immensely broader and taller can be fashioned."

If we are not mistaken an arrangement somewhat similar to that just described was given a trial in France almost twenty years ago by one Abel Pifre. The device brought out by the Frenchman consisted of a horn-like disk

which threw the sun's rays into a mirror that concentrated and projected them beneath a boiler. The device was never given a practical trial but once and was thereafter abandoned.

That the heat from the sun will some day be made use of for generating steam there is little doubt, but it will not be until some satisfactory system for storing surplus heat has been brought out, similar in principle to the Halpin storage system made use of in connection with garbage destructor plants in England.

\*

Another
Football for
Wall Street.

After the "workers" in Wall Street had thoroughly squeezed the many small investors in Brooklyn

Rapid Transit stock, they turned their attention to the stock of the Third Avenue Railroad Company of New York with a result that the stock declined 10 points on Saturday, closing at 75\(\frac{1}{8}\). This makes a total shrinkage of 150\(\frac{1}{8}\) points in six months, the shares having been quoted at 226 in the early fall. This represents a loss on the \(\frac{1}{8}16,000,000\) of stock at par outstanding of over \(\frac{1}{8}23,000.000\).

It is said that James R. Keene, one of Wall Street's most prominent operators, has become involved in the company's securities. He is, in effect, the real owner of a large part of the holdings of Henry Hart, who formerly owned one-third of the company's capital of \$16,000,-000. The financial tangles of the Third Avenue Company are many and varied. It is said that a number of the large banks hold the road's paper. Several of the largest institutions of this class, as well as half a dozen prominent trust companies, put up most of the money the company is now unable to pay. Officials of none of these will admit this, as it would reflect no credit on their houses for it to be known that they made such injudicious loans. But their names are likely to be revealed when the new directors are selected.

A plan of financing the company and of leasing the properties to a new corporation was under discussion on Saturday at the office of Vermilye & Co., and this firm, with Heidelbach, Ickelheimer & Co., Halgarten & Co., and other smaller Wall Street houses, compose the syndicate which is the last hope of the Third Avenue Company in the matter of monetary rehabilitation. There were present members of the firms interested, Attorney Edward Lauterbach, representing the Third Avenue Company, and Gen. Louis Fitzgerald of the Protective Committee, looking out for the interests of the \$16,000,000 creditors. None of these gentlemen would say anything after the conference, except that the entire ground was gone over and the preliminaries of a plan formulated.

Justice to the stockholders requires that a thorough reorganization of the road should take place at once, and that an investigation should be made in order that the stock-jobbers who have been playing with the road's affairs receive the censure or punishment they justly deserve, "even if they are the parties who have been trying to get a monopoly of the heat, light and power business of New York."

The contract for building the rapid transit railroad in New York was signed on Saturday and Contractor McDonald says that within thirty days he will begin the work of digging and blasting. The work will involve the spending of \$20,000,000 for skilled and unskilled labor, and the employment of over 10,000 men.

William B. Parsons, civil engineer, will superintend the construction of the road. It is the general belief that the Metropolitan Street Railway Company will operate the rapid transit railroad under the contractor's fifty-year lease. Albert B. Boardman, of counsel for the Rapid Transit Commission, said on this point Saturday: "I think I am violating no confidence, when I say that the Metropolitan Street Railway Company is the natural operating company for this road. It occupies the best position to operate and get the best results out of the tunnel. The Metropolitan's lateral lines make the tunnel more valuable to it than to any other company. A law of gravitation will make this lease fall into the hands of the persons most fitted to use it—the Metropolitan Street Railway Company.

# UNDER THE SEARCHLIGHT.

## Notes and Comments on Various Topics.

New Jersey is trying to pass a law substituting execution by electricity, as in New York, for hanging.

In the New Orleans carnival there were sixteen floats operated entirely by electricity. It was the boldest innovation ever attempted at the carnivals in that city, and fully demonstrated the utility of electricity for moving spectacular productions on a grand scale.

The National Cycle and Automobile Company which has recently commenced the manufacture of bicycles, automobiles, etc., in the city of Hamilton, Ont., intends operating its works by electricity supplied by the Cataract Power Company.

A PRESS dispatch from Springfield, O., says: "The National Magneto Electric Telegraph Company, of which Dr. L. E. Niles of Springfield is president, has been offered \$800,000 by an Eastern syndicate for its patents, which cover a new style of telegraphing, by which batteries are dispensed with altogether and magnets substituted.

ASSEMBLYMAN DELANEY has introduced a bill in the House at Albany to permit every city of the State of New York to acquire municipal control of public utilities. It is said to be drawn in a more effective manner than any piece of legislation as yet introduced. The bill is brief and as a whole merely arranges for referendum on the subject of municipal ownership when one-fifth of the voters of any city demand that ballots for this purpose be prepared.

THE plans for the first Automobile Show, which will be managed by Mr. Marcus Nathan, have now taken definite shape. To letters sent out to a number of manufacturers, making inquiry as to the most desirable time to hold such a show, responses were received, all expressing a preference for the fall season, and offering their heartiest co-operation towards making it a complete and representative exposition. The dates selected are from Saturday, November 10, to Saturday, November 24, inclusive, and of course ample time will be allowed for installing and removing exhibits. It is considered an advantage that the Horse Show will be held during one of these weeksfrom November 19 to 24. There are each year something more than 50,000 out-of-town visitors to the Horse Show, and practically the same people will be interested in automobiles.

The dates chosen for the Automobile Show will therefore make it practically certain that the attendance and visitors to the Horse Show will also be secured for the Automobile Show. Grand Central Palace, covering a city block from 43d to 44th street and Lexington avenue, to Depew Place, has been chosen for the exposition, because it has the largest exposition space and will permit a more comprehensive show. One hundred thousand square feet of floor space are available for automobile exhibits. and the only other exposition building in New York offers a total floor space of 34,000 square feet, which space, for a number of reasons—as several manufacturers of automobiles know from experience-is not desirable for exhibiting heavy vehicles.

WILLIAM HEAL, ex-county treasurer of Marion, Ind., who has been experimenting with a device for melting glass by electricity, has made a second test, which is more successful and gratifying than the first. He is now confident of the value of the invention. He contemplates several changes before putting it to a practical use.

THE Kern Incandescent Gas Light Company has just closed a ten-year contract with the City of St. Louis to equip 11,000 street lamps. There was considerable competition for this contract between the Kern and Welsbach companies, which was won by the former.

THE London "Daily Mail" says: "For two years the war office has been testing an electrical position finder, invented by an Australian named Alcock, who says that his invention will give the range and bearing of a fixed or a moving object, and at the same instant will give information to any number of fortress guns attached by wire to the instrument, thus enabling a hundred guns, for instance, to concentrate their fire simultaneously on a single ship. It is to be hoped that the war office will arrive at a decision before the invention is offered to the United States."

AUTOMOBILE clubs are springing into life at a rapid pace. The Automobile Club of America has its headquarters at New York, and already Chicago, Boston, Cleveland and Philadelphia have completed the organization of clubs. The Cleveland Club is to supplement the annual Decoration Day bicycle track and road races by an automobile race.

THE Pittsburg "Post" on the 22d inst. contained the following: "One gigantic combine is to fight another in the electric supply business. Contractors, who have taken work on contract for the year, have taken steps to protect themselves against the combination of supply houses, now forming in New York. If the combine in the metropolis meets with success, it will have to combat one of the strongest organizations of capital and skilled labor that the world ever knew. In all the leading cities of the country associations of the contractors have been organized. These associations have made contracts with the skilled workmen, and a compact has been made that will make itself felt. Pittsburg figures prominently in the proceedings. The association of electrical con tractors of Western Pennsylvania is about ready to organize, and a meeting will be held in Pittsburg within the next ten day. A national organization is asked for by a circular that is ready to be mailed to all of the contractors of the United States and Canada. As has been published in telegraphic dispatches, the

supply men are about ready to do business on a combination basis. The building boom is on and a big advance in prices is expected. The contractors have made their contracts with the builders and with their workmen at fixed prices, and an advance in supplies will cause a loss of money to many."

It is reported that from thirty-five to fifty motor vehicles will take part in the thousand-mile race of the Automobile Club of Great Britain. The distances to be traversed daily vary from eighty to one hundred and twenty-four miles. The race will be run about the 1st of May.

# SOCIETY NEWS.

# American Institute of Electrical Engineers.

The 140th meeting will be held at 12 West 31st street, New York City, this (Wednesday) evening at 8 o'clock. A note on "A Farad-Meter" will be presented by Dr. M. I. Pupin. A paper will also be presented by Edward C. Boynton, entitled "Notes on Electric Traction Under Steam Railway Conditions."

Applications have been received from the following candidates for associate membership, which will be acted upon by the council at its meeting March 28:

Fred. A. Fish, Columbus, O.; A. N. Shaw, Brooklyn, N. Y.; Harry B. Marsh, Indianapolis, Ind.; Carl F. Fog, Lynn, Mass.; S. W. Rushmore, Jersey City, N. J.; J. M. Morehead, I. J. Macomber, Chicago, Ill.; M. H. Offinger, Buffalo, N. Y.; Chas. C. Stutz, Max D. Baron, New York City; J. W. Esterline, Lafayette, Ind.; F. O. Blackwell, Schenectady, N. Y.; J. D. Mortimer, A. C. Babson, Berkeley, Cal.

# The New York Electrical Society—203d Meeting.

At the 203d meeting of the New York Electrical Society, which will be held at the College of the City of New York, Lexington avenue and 23d street, on Friday, March 2, at 8 P.M., Dr. A. R. Ledoux, who will lecture on "Copper from the Ore to the Wire Bar," will describe the characteristic ores, exhibiting specimens, also the three types of mines from which copper is obtained in this country, those of Lake Superior, Arizona and Montana; giving an outline of the metallurgical process employed in each case, and exhibiting specimens of the product in different stages of retinement. Dr. Ledoux will also give valuable statistics of the growth of the industry and its present development.

# Sparks from the Point of a Lightning Rod.

I have an extract from a letter from one of your correspondents calling attention to the appearance of sparks at one of the five points of a lightning rod.

My experience during hundreds of kite ascensions with steel and copper wire is that a spark of atmospheric electricity appears only when the kite and wire are insulated from the earth by a wooden winding reel or other insulation, and only then when the wire is made to approach within a fraction of an inch of an iron rod driven into the ground. If the kite and charged wire are very high in the air—and the spark will leap farther in proportion to the altitude of the kite—then the sparks pass so rapidly that they form an arc or a light of small candle power.

I can only try to account for the appearance of a spark on the upper point of the lightning

rod on the assumption that a highly charged layer of clear air—perhaps vapor laden and yet not misty—was within a short distance of the ground and so caused an evanescent brushlight, which by paling and then again glowing brightly might produce the effect of a spark. At night this glow can be readily seen if the edge of a woolen garment is made to approach the highly charged steel kite wire with which I am working. But this glow in the darkness only takes place with the near approach of objects negatively charged at the earth as compared with the positive charge of the kite wire extending up toward the positively charged clouds.

These facts do not enable me to account for the phenomenon observed by your correspondent, but they call attention to a singular analogy.

WILLIAM A EDDY.

Bayonne, N. J.

# National Electric Light Association Convention.

The Central Passenger Association have granted a special rate of a fare and one-third on the certificate plan, from all points in their territory to Chicago and return, for delegates and friends attending the twenty-third convention of the National Electric Light Association, to be held in Chicago, May 22, 23 and 24 next. It is expected that the various other passenger associations will announce the same concession at an early date.

### LONDON NOTES.

# [From our London Correspondent.] Estimates Wanted for Electric Tramway Plant.

The Durban (Natal) Corporation is inviting tenders until April 2—therefore this intimation should be in time to be of service to American contractors who do not happen to be represented in England—for the laying of 14.36 miles of equivalent single track and the bonding of 2.96 miles of equivalent existing track. The Corporation of Durban will lay the concrete foundations and make up the roadway but the tenderers will have to be prepared to supply: 1,900 tons of steel girder rails; 64 tons of fish plates (including the necessary quantity of fish bolts, nuts, tie bars and electric bonds), and 407 loads of Australian hardwood stringers with the necessary quantity of dog spikes, etc.

Tenders have to be sent to the town clerk of Durban by Monday, April 2, in duplicate. Specifications, forms of tender, etc., can be obtained from the London agents to the Corporation, viz., Messrs. Webster Steel & Gompany, 5 East India Avenue, Leadenhall street, London, E. C.; a deposit of £10 10s. has to be sent with applications for specifications. If tenders are sent to the London agents they have to be delivered by Thursday, March 8.

Some large electric car contracts are going just at present, including 200-300 motor car trucks, motors and equipment for same for the Glasgow municipal tramways, which have already placed large orders with American houses for electric traction engines, generators, cables, etc. It will be no great surprise to English contractors to hear that this contract has gone to America.

Another announcement which may perhaps interest Americans is to the effect that the Coatbridge town council is anxious to receive proposals from companies willing to lay down a system of electric tramways in that town

## CHARGING AUTOMOBILE STORAGE BAT-TERIES FROM ALTERNATING CIRCUITS.\*

BY V. M. WEAVER.

In nearly all of the larger cities at the present time are automobiles, and the number is increasing rapidly. Of the three methods of propelling them, the electric is reasonably sure of being found in all of these places. For charging the batteries of these carriages, direct electric current is necessary, but many of our cities have outgrown the earlier Edison direct-current systems, and the alternating current lines reach the outlying and newer parts of the cities. Charging stations established in such places for renewing the batteries of public and private automobiles must use some method of changing this alternating current to direct-current for such purposes.

To accomplish this a rotary converter, which is a dynamo electric machine having its armature wires connected both to a commutator and to rings, or a direct-current generator driven by an induction motor may be used. Of these two, the rotary converter is seldom used, since a synchronous motor is hard to start and trouble often occurs. The induction motor of the latter device is self-starting, and on this account is being adopted for this service. The demand for such outfits is sufficient for manufacturers of electrical machinery to build outfits especially intended for this purpose.

An outfit of this kind, built by the Wagner

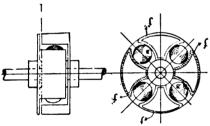

Fig. 1.—Friction Clutch.

Electric Mfg. Co., of St. Louis, is very compact, and is easily set up and operated. The winding of the motor gives a loop terminal which is used only when the motor is being brought up to speed, or in case an overload is thrown on it. The field coils are wound for either 100 or 200 volts.

The connection between motor and generator is by a friction clutch, the bearing surfaces being a set of solid rubber balls, as shown in Fig. 1. In sizes above six kilowatts capacity more balls are used. Perfect insulation, noiseless separation and great flexibility are secured.

The charging outfit of the Illinois Electric Vehicle Transportation Co's station at 47th street and Cottage Grove avenue, Chicago, is illustrated in the diagram Fig. 2. Two nine kilowatt outfits of the style shown are used. The generators give a direct current at 125 volts. In the diagram, T is a reducing transformer, from 1,100 to 110 and 110 volts, so arranged that when the double-throw switch S is up a current of 110 volts is impressed on the motor to start it, and when the switch is down a 220-volt current is thrown on. This brings the motor up to speed, and continues to run it. F is a rheostat in the field circuit so as to maintain a constant pressure of 125 volts.

Only two charging connections are shown, the others in the station being the same as these. At P P are the plug holes in which are

inserted the terminals of the flexible cords with which connection is made to the batteries. In each circuit there is a regulating rheostat, R. A volt and ammeter switch, A, is so arranged that by a cross-arm the outer opposite clips may be short-circuited respectively to the inside and outside rings. This connection enables-the attendant to read both the current and pressure in each circuit.

The battery is removed from the cab for charging, being drawn out on a truck. It con-

introduces the modern machinist to a field of unlimited possibility requiring most exact knowledge of new and constantly changing methods; and the experience of all employers testifies to the difficulty, if not the impossibility, of securing the requisite knowledge and skill in the machinists of to-day.

If the position of machinist is a hard one to fill, what is to be said of that of foreman? At a recent meeting of managers it was stated that 200 young men suitable for foremen for

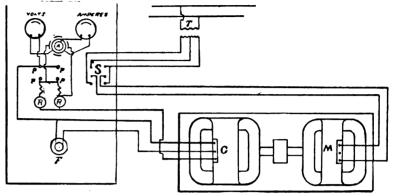

FIG. 2.—PLAN OF CHARGING PLANT.

sists of 48 cells with a normal discharge rate of 30 amperes. In charging it is the practice to commence with a 40 ampere current and continue until the battery takes 10 or 12 amperes at 125 volts, when it is ready to take the place of an exhausted predecessor. A truck carries it to the cab whose battery it is to replace. After every trip, whether the run is long or short, the battery is replaced by a newly charged one, and the driver, on leaving a station, always knows what he has to depend on. The company has a number of these charging stations distributed about the territory covered by its vehicles.

# EDUCATION OF MACHINISTS, FORE-MEN AND MECHANICAL ENGINEERS,\*

BY M. P. HIGGINS, Worcester, Mass.

# DEMAND FOR TRAINED MECHANICS.

While it must be admitted that during the past twenty-five years most gratifying progress has been made in American mechanical engineering and in the education of mechanical engineers, yet it is evident to the managers of our mechanical establishments that there is a great lack of competent mechanics below the grade of mechanical engineer to take the increasing demands and responsibility of the work and properly carry it out.

The standard of the work of the machinist has rapidly moved forward in refinements and complications. He is called upon to read and understand intricate drawings, and to make quickly and with certainty very exact measurements and computations in the shop. He must deal with tempered steel for almost numberless uses and for the severest requirements. Hardened steel parts must be fitted to an extent and with a precision never thought of twenty-five years ago. This practice of machine construction will be introduced to an unlimited extent in the future, necessarily making many changes in methods, as, for example, the substitution of grinding for filing, which will secure so much better results. This

foundries could be placed at once. Nothing is more difficult than to find men capable of filling such positions. Indeed, I have expressed the opinion, and I believe it will be confirmed by others, that the most difficult position to fill when a machine business is to be organized is that of shop foreman. The positions of president, treasurer, mechanical engineer, salesman, etc., need not wait a day for applicants, but the man who is fitted to manage the practical details of a machine shop successfully is a rare man, and there is no scientific or professional man whose services are in surer demand than his,

Is it not wise, economical shop management which is giving us the leading position in the machine markets at home and abroad? This is what we expect the good foreman to exhibit. The ability to produce a very fine and exact piece of work in a machine shop, regardless of time or method, will not insure success, but, on the other hand, will be most apt to induce failure. It is the shop which can build the best machinery at a less cost than others which is sure to be successful; and to secure this the management must depend upon no man more than the shop foreman. He must ascertain all possible legitimate ways and means for reducing shop costs, stopping leaks and losses, without reducing the manliness of the men and the standard of the work. How many men of this kind do we get, and what opportunity is there to-day for training for such positions?

With this great and growing Temand of the profession, and with the splendid opportunities open to young men who will fit themselves to be mechanics, and who in turn are demanding of the profession the chance to fit themselves, the question is forced to our attention: How are these needs being met?

# IMPORTANCE OF GETTING ABOUT LIFE'S WORK EARLY,

It is quite generally considered the wisest policy to advise young men to lay patiently a broad foundation in school and to be content if the life work is fairly entered upon at from twenty-five to thirty-five years of age. But there is a gradual change of opinion taking place among many educators, and they are coming to believe that the most receptive period is under twenty years of age. There-

<sup>\*</sup> From "The Automobile."

<sup>\*</sup>Abstract of paper read at the annual meeting of the American Society of Mechanical Engineers, held at New York, December 6, 1899.

fore, aside from the necessity under which a poor boy labors, who has his way to make in the world as a workman, he should early be induced to look forward with a fixed plan and purpose to his life work, and there should be given him, in some suitable school, fundamental training which should fit him for his occupation. On the other hand, this must not limit him, as it should lead directly through the successive grades toward the highest professional work of that industry which he chooses.

# FAILURE OF THE TECHNICAL SCHOOLS TO REACH THIS CLASS.

Never was there a national movement more timely or more successful in its introduction than the movement looking toward the establishment of technical schools thirty-five years ago in this country, supplemented as it was by the educational land grant act in 1862. We naturally expected at that time that this movement would meet not only the higher education of engineers, but the needs of mechanics. which this paper emphasizes. Perhaps, however, it was too much to expect that these schools, under the management of professional educators, the most able and suitable that could be selected at that time, could have accomplished so much or covered more ground than they have. It is most natural that each technical school management should be greatly influenced by the college education and academic professionalism of the men who conduct it, to whom were entrusted the relations of academic and practical departments and those of theory and practice. This has resulted in a tendency to produce scientists and not mechanics.

It is not the policy and intention of engineering schools to put sufficient time and stress on shopwork to allow the student to attain thorough practical skill. He very readily receives the impression that an engineer need not work with his own hands, though he admits that he should know how the work should be done by others. To be a thorough mechanic, which he ought to be before he can be a well-trained mechanical engineer, he must be able to do the work, and this the present technical school does not teach thoroughly.

The gulf between the work of the schools and the shops has sometimes been called a difference between theory and practice: but the real variance in educational attempts is between men, between the mechanic and the schoolman, betwen the machinist and the engineer. Brave attempts have been made to bring the two together, but with partial success only. In one of our most prominent and practical engineering schools a professor had designed a commutator which required sections cut from a metal ring. The professor ordered two rings, so that a piece from the second could be used to make up for the loss in cutting up the first. The machinist said, "Let me make one ring only, somewhat larger than you want, cut it up, and then turn it to the exact size; and thus save the cost of the second ring." "No," answered the professor; "I am doing the engineering, I want you to do the work." I state this actual occurrence, as one of many llustrations which might be given, to show that the two have not yet joined work even in the technical schools. It is not always an easy matter to secure this necessary union, and even where it seems to be attained it is not always complete. It can be secured by having both vital parts in one and the same man. And it is exactly this union that the proposed

system for training mechanics is designed to secure.

The very surprising fact that the total number of students in technical colleges in this country is at present on the decrease, may suggest that some changes in the engineering courses would better meet the needs of a larger class.

### RAISING OF STANDARDS OF ADMISSION.

I would also mention that with the tendency toward the abstract and scientific which has been referred to, has come the raising of standards for admission from year to year, so that the technical school has become more nearly on a par with the college than it was when it started; and this puts the school beyond the reach of boys who are to make workmen and also beyond the reach of many who would make engineers.

# ANOTHER UNFORTUNATE RESULT OF THE TECHNICAL SCHOOL.

As a result of the technical school overlooking the needs of the large body of mechanics and devoting themselves to the production of scientific professionalists, they produce an enormous amount of discarded material, men who are neither fit for workmen nor engineers, men who are not at the start fit to become successful engineers.

In a class of one hundred in an engineering college, if only five make engineers such as the course is aimed to produce, the ninety-five others have not, in all probability, received a course of training well fitted for their special needs and capacities. Further than this, the large portion of the class who are, to some extent, failures are also frequently disappointed men.

There are many reasons why the young man who enters an engineering school is allowed to get false ideas regarding his future. He understands that there is a lively demand in the active world for technically trained young men. He likes the idea of being an "engineer," and he knows that all the leading technical schools have high-grade engineering courses, the requirements are up to the colleges, and he expects when he graduates he will be able to engage in engineering work. When he finds that he either cannot do engineering work at all, or that there are ten engineer graduates to one position of that particular kind, and that every year the demand for professional engineers grows less and the graduates more numerous, he turns his attention reluctantly to a lower grade of work and is never quite satisfied or happy in it. He feels that he was born and educated for something better. But was he? No. He only thought he was. His failure would be no fault of the school, however, if he had not been, in a sense, educated away from the work that he is obliged to undertake. These "culls" from an engineering class are not first-class material for workmen in any department below the engineer. Such a man is a disappointment to himself and to his employer And though we may be able to show that every graduate in a class has been greatly benefited and developed during the course of study, yet that is not a sufficient reason for a course fitted only to the very few and which allows the large majority to come to their disappointment through the general understanding that, if they were graduated, they would be engineers because they were graduates.

## OVER-SUPPLY OF POLYTECHNIC ENGINEERS.

We must remember that mechanical pro-

gress is very dependent upon the capitalist. The proprietor who stands behind the work is more inclined to trust his engineering to his own men who have grown up in the works and have, in some way or other, picked up science enough to get on with considerable success. The proprietor is not inclined to put his work into the hands of a professional engineer who works on the same problem for other clients, and he is less inclined to employ special engineers. When this is done at all, one engineer is employed by several concerns, and his time divided up among them.

This lessened demand for polytechnic graduates was recognized several years ago in Europe, and some slight attempts were made to remedy the evil. As early as 1885 the British commissioner found in Germany an excess over the demand, of 1,000 well-trained polytechnic graduates, and they were informed that the manager of a large engineering works had been so importuned by these young men for employment that he put a notice in his window, "No polytechnic student need apply.' The Baron von Eybesfeld, Austrian Minister of Instruction, stated that the most serious problem in education in that country is to reduce the number of theoretical engineers (who, after their long course of study, find themselves not wanted) and to increase the number of men in whose training theory and practice had been so combined that they could meet, the great demand for those who can put theory and practice together. This statement, taken from a report of Technical Instruction in Europe, by the late C.O. Thompson, formerly president of the Rose Polytechnic Institute, and published by the United States Bureau of Education, is followed by another statement which shows that the tendency of the technical schools toward a par with the college, referred to above, was fully recognized and admitted at that time. This statement says: "There is a constant and apparently irresistible tendency in all the lower schools to pass up into the higher by imperceptible advances. For example, at Chemnitz, what used to be the Gewerbeschule has ranked since 1879 as a polytechnic school. But so true is it that a school of higher education never loses or departs from the cast it receives in the first ten years of its existence, that the old polytechnics, modeled largely after the Ecole Polytechnique of Paris, have so steadily held to the theoretical training of engineers that the times have swept past them. The efforts now making in Austria to romedy this evil are more to the point than any others in Europe, but they are directed towards the artisan rather than the engineer."

# PROPOSED SOLUTION OF THE PROBLEM.

The proposed solution of the problem lies in the answer to the question: "How can we give our boys a chance to learn a trade without being deprived of a good common school education, and at the same time secure a foundation upon which to build a higher education if capacity and circumstances permit?"

The half-time school, established upon the plan outlined below, will, it is believed, answer this question and solve the problem.

This school is aimed to fit each boy for the successive grades of mechanics from the machinist up, so that at any time he will be fitted to take up his work outside as a well-trained mechanic in the grade which he has completed and be prepared to enter the training of the next grade. In other words, the object of the school is to produce many well-trained and educated machinists, and from these ma-

chinists some foremen, from the foremen a few superintendents, and finally an occasional engineer. The character of the individual material in ability and natural aptitude determines the grade of the product of the school, whether workman, foreman, superintendent or engineer. The plan will be understood by a brief statement of its prominent features, which will be discussed more at length below.

#### CHIEF FEATURES OF THE HALF-TIME SCHOOL.

First-A school which shall include a firstclass commercially successful and productive machine-shop, which is a department co-ordinate in importance, influence and educational value with the academic department.

Second-A school in which the pupils are to have instruction and practice in this shop during half the working hours in five days of each week for a period of four years.

Third-Instruction in the public schools during a portion of the other half of the time. equivalent to a high school course, restricted, abridged, and improved to meet the needs of these pupils.

Fourth-Special care and method of selection of pupils who have finished the grammarschool course and who have special aptness for mechanical work.

Fifth-Management under a corporation whose trustees shall be practical business men.

Before proceeding to a discussion of these features it seems well to say a word upon the principle already briefly stated, which lies at the foundation of this school -namely, the education of one period leading to the next, so that there need be no break or limit until the most complete education of the engineer is finished.

### EDUCATION COMPLETE AT EACH STAGE.

The main thing which should determine the point where schooling had better be stopped and the real life-work begun is the natural endowment of the pupil, so that whenever he stops he has received the best possible course of schooling and training for his particular career, whether it be as machinist, draughtsman, foreman or manager. And if he has aspirations and natural ability for some position higher, not within the scope of the half-time school, this course may lead to the technical school. Thus he has no back steps to take nothing to unlearn, and nothing which he might better have left out. He is not handicapped by lack of preparation to enter the technical school. When he enters the halftime school be need not give up his aspirations for this higher education, as is the case to-day if he leaves the public school to learn a trade: he has not burned his bridges behind him, but all that he has attained in the half-time school is the best possible understructure for his higher work, even if he becomes an engineer and undertakes the most responsible engineering works devolving upon mankind. If he is not adequate to undertake such work, it should not be the fault of his school training, but due to the limit of his natural capacity. "Many are called, but few are chosen." We need not grieve at the very few chosen, because but few are required. But few professional engineers can be employed provided the greatbody of working mechanics are effectively educated to think clearly, keenly and quickly. To produce such mechanics is the first object of the half-time school.

This school begins with the education of the masses as machinists, and then by natural selection promotes to the grades above. The

selection and elimination begin at the bottom and proceed upward, rather than, as is now the case with the technical school, beginning at the top and proceeding downward, dropping a large number because they are failures. In the half-time school, if the boy's natural capacity or the lack of demand fails to take him into the position of engineer, yet he is a success as a working mechanic in one of the grades below, and when a boy drops out for any cause, he drops on his feet.

We may hope for much from a thousand educated, thinking, expert American machinists, who have the skill, education and an exact knowledge of the shops. Is not the production of one hundred well-educated workmen a more certain undertaking than the production of one genius? There is certainly no impassable gulf between the ideal engineer and the great body of workmen. If there was, there would necessarily be one school for engineers and a different one for workmen, another for laborers, another for foremen, another for superintendents, another for managers, etc. In the half-time school all grades may go on together as far as possible.

The real engineer, in consequence of superior natural fitness, carrying capacity for knowledge and practical experience, and cultivated mental faculties, is a superior man to his fellows. His superiority over and above the mechanic, or machinist, I insist, however, is a difference of degree and not a difference of kind. All should begin in the same school. The engineer is superior because he takes more, and he takes more because he has the capacity to carry more. Therefore, he cannot afford to be minus any good thing which the man below him possesses; he can afford to have all the specific shop knowledge and practical experience of the workman below

The Alpine explorer does not approach the highest peaks from the clouds, but he walks from the foot hills with his fellows, some of whom never go above the pastures, others never above the slippery glaciers; but he that is fittest keeps step with each and every one so far as each can follow. The hero takes every step that the plodder takes: the only difference being that each step of the better man is surer and bolder, and all along through the simple things a promise of higher things is evident. Every step the hero makes is an inspiration to his comrades, and sure progress to himself. But finally he goes onward and upward, more and more alone. Something of this sort of superiority, I believe, may result from a proper natural training for mechanics, where each boy is inspired by the progress he has made, and consequently feels more and more intensely fixed upon taking the next step upward.

In the present school system the young man may look forward to some higher position he vaguely hopes for, but it is frequently late in life, if ever, that he gets the better help which comes from looking backward over daily achievements (such as I believe a half-time school with large shop opportunities can give) all along the way from his humblest experiences. Not only when the pupil leaves school he steps upon a level of work for which his schooling up to this point has fitted him in the best manner, but furthermore, he has been fitted in the best manner to take the next higher work in school at once, or after a year or two of shop work for the sake of money earning, thus enabling him to take a higher course in an engineering school.

#### THE STANDARDIZATION OF AN ELEC-TRICAL ENGINEERING PLANT.

### BY R. PERCY SELLON.

To the user of an electrical engineering plant, not less than to the producer, the subject of ts standardization is one of great practical importance.

By "standardization" is meant the general acceptance, to a far greater extent than at present obtains in this country, of certain tandards of output, quality, efficiency, or other characteristics of an electrical engineering plant, to meet ordinary requirements of usage for light, traction and power.

1. Of the four chief ingredients of successful competitive production, viz.: (a) cheap labor (not to be confounded with low wages); (b) cheap materials; (c) efficient management, and (d) repetition manufacture, much has been said and written of the first three, but little of the last. And yet every manufacturer of experience knows that it is as influential a factor in determining not only his own profit, but decisive advantages to the user, as any of the factors of labor, materials or supervision. In order to convince oneself of this, it is only necessary to consider the influence of repetition manufacture upon the price and reliability of any article of common use-say, in our own industry, incandescent lamps and their accessory fittings, in respect of which some measure of standardization has been evolved; and to reflect what, on the other hand, the cost would be if many manufacturers or users adopted different standards.

In the early years of an industry, experiment and development by trial and error are desira ble and inevitable in order to ascertain the possibilities and limitations of the art. But as the stage of repetition public demand is reached, standardization becomes increasingly possible and advantageous.

Its advance is, however, liable to be retarded by a number of causes, notable among which are the folly of some producers, and the ignorance of many users.

There are always some manufacturers who think that by supplying a special or unique type of apparatus to the buyer they will force him into placing his future orders with them. Hence they resist any tendency towards standardization.

There are also many buyers who allow themselves to be persuaded into the belief that in securing something new and different from previous usage they are doing well for themselves and giving evidence of superior intelligence; whereas the probability is that they are paying a higher price for a less reliable article.

There is a third class who believe that standardization is the business of the producer only; and that the user need not concern himself to assist in bringing about a condition of things for which every manufacturer who knows his business eagerly strives. This view is erroneous.

The intelligent producer is undoubtedly deeply concerned in the advent of standardization; because it means for him the possibility of repetition manufacture—on the manifold advantages of which it is not necessary to dwell.

But to the user, if he would only realize it, the fruits of standardization are equally beneficial; for they involve for him the following advantages:

<sup>\*</sup> Paper read before the Institution of Electrical Engineers, London, Feb. 8, 1900.

- (a) Less capital outlay.
- (b) Prompt delivery.
- (c) Immunity from the risks attendant on novel designs.
- (d) Full manufacturer's guarantees.
- 2. Viewed from the "patriotic" standpoint, this subject acquires also special significance in these days of acute struggle between British, American and Continental manufacturers for our own and the world's markets in electrical wares.

The causes which underlie the ability of American and Continental producers to compete keenly and successfully with the British electrical manufacturer are several, and generally outside the scope of this paper. But conspicuous amongst them is the fact that the former have (as any one who has visited their leading workshops can testify) attained to a degree of repetition manufacture superior to the British producer.

This fact is so noteworthy as to constitute in itself a telling argument in favor of increased standardization among us; for the flood of the American electrical engineering plant into Great Britain is swelling in spite of the fact that we have the advantages of lower wages (on the whole), cheaper materials and a longer experience of factory organization.

3. It therefore becomes important to endeavor to trace the cause of this preferential position held by our foreign rivals. The explanation would appear to lie in a difference of procedure.

According to American and Continental practice the producer determines, in a large measure, the character of the plant employed by the user; while according to British custom the buyer very generally imposes upon the manufacturer not merely a specification of the ends he wishes to attain, but the details of means by which he desires those ends to be achieved.

This is due to the fact that under the American and Continental system producers largely secure outlets for their manufactures through the agency of powerful financial organizations created by and allied to their interests, who are concerned simply with commercial results, and are content to leave the technical means of attaining them to the manufacturing interests with whom they co-operate. In America these organizations take the form of colossal trusts or consolidations of competing interests; on the Continent that of industrial banks. In either case there is a close relation between producer and buyer.

In Great Britain, on the other hand, the demand for an electrical engineering plant in recent years has issued chiefly from local authorities, or from private users unconnected with any manufacturing interests; and these have very naturally had recourse to electrical engineers acting in a consulting capacity or passing permanently into their service, to guide them in the choice of plant to fulfill their requirements.

That the practical operation of this system in the past has been primarily responsible for the relative absence of standardization in this country, with its attendant evils alike to user and producer, appears certain. For the user's engineer has frequently been out of touch with manufacturers, and the temptation to strike out on new and "showy" lines, suggestive of individuality, ability, or foresight, has, in the very nature of things, been great. The result has been the issue of specifications too often calling for wanton divergen-

ces from previous practice or existing manufacturers' standards.

The source of the evil is traceable to the fact that the buyer's engineer has gradually overstepped the rational function of stating the ends or performance required by the buyer, and has proceeded to specify in minute detaithe means or constructional methods by which the required results are to be achieved, with out taking responsibility for the result.

It is not necessary to adduce specific examples in illustration of this statement, because the author believes that it is one which not fair-minded electrical engineer acquainted with the facts will dispute. There is not difficulty in producing overwhelming evidence of its truth if such be required.

To the same primary cause may probably be traced the variety in size and character of the power units in many of the central stations of Great Britain-another instance of "splendid isolation" in our methods; for foreign prac tice is at one in adopting fewer and larger units, uniform in size and character from the commencement. Whether advantages of temporarily reduced capital outlay and higher efficiency under our system are a sufficient com pensation for loss of interchangeability and periodical relegation of plant to the old metal market, remains to be proved when the bills are presented later on and contrasted with one another. Meantime it is interesting to note that one result of our procedure is the comparative unreadiness of British manufacturers to compete with foreign producers in the common markets of the world as regards large units.

4. Whether British collectivism is on the whole a more healthy medium than American or Continental private enterprise for the progressive growth of the electrical engineering industry is a large question outside the scope of this paper. We have here to accept it as a fact, and consider whether an evil which it has brought in its train is a necessary one, and if not, how it can be averted for the future.

Assuming, then, that the buyer's engineer has come to stay, it would appear that a condition precedent to the standardization of plant is the standardization of the buyer's engineer.

The fundamental fact requiring appreciation is that standardization, to the greatest degree possible, is in the interest of the user at least as much as that of the manufacturer.

From this we may pass on to postulate that standardization is primarily the function of the producer and not of the user or his engineer, because the former is in a better position to determine, experimentally and by his more intimate knowledge of the means of production, the direction and extent to which it is possible. Inasmuch as the manufacturer's success is dependent on the judgment with which he creates or responds to public demand, there exists always an efficient safeguard that he will not (consciously) standardize on unsuitable or inefficient lines.

The user, on the other hand, is of course the proper judge as to the results he wishes to achieve.

It would appear, therefore, that the initial obstacle to a greater measure of standardization than at present obtains would be removed if the user or his engineer would confine himself to stating the ends he has in view, leaving it to the producer to furnish the means whereby they may be attained.

If this procedure was adopted users would still retain full liberty of choice between the

products of different manufacturers, while the latter would have an opportunity (which under the present system of detailed specifications they do not enjoy) of undertaking repetition manufacture, assuming that they have sufficient confidence in the substantial harmony between their designs and public requirements to take the risk of quantitative production.

This system would have the incidental advantage that the producer could then be properly called upon to guarantee results, since the responsibility of selecting the means to attain them would rest exclusively with him. The present custom too often imposes upon the manufacturer a mass of fantastic detail emanating from the brain of the user or his engineer, for which he is called upon to take responsibility; an illogical system which can only be compared to the proposition that every man should be expected to father another man's child.

It may be objected that the general adoption of the course suggested would lead to stagnation in development, and that the producer, relieved from the constant pressure of change now exerted by the user, would settle down to the perpetuation of antiquated designs-to the disadvantage of the public and the fetich of progress. The answer to this is, firstly, that much of the change hitherto demanded has been wanton and retrogressive; secondly, that competition within the ranks of manufacturers themselves must always prove a sufficient stimulus to keep abreast of public demand; and finally, that it is largely by the adoption of the system suggested that American and Continental producers are snatching trade from the British manufacturer in his own market.

5. If, then, the principle be accepted that standardization, with the qualification named, is for the advantage alike of producer and user, we may pass on to consider how far, and by what means, it is capable of beneficial extension.

Standardization pre-supposes such a substantial and sufficiently enduring demand for an article as to make it worth the while of manufacturers to incur the requisite outlay in time and money to achieve it. Hence, as already mentioned, in the early and experimental stages of an industry it is neither possible nor desirable. The period at which it becomes practicable is largely one for the judgment of producers. But from the preceding argument it is evident that the user plays an influential part in hastening or retarding its advent-as is proved by the fact that standardization is much further advanced for the same character of products abroad than in Great Britain. This clearly indicates that it is the system in this country, and not the infancy of the industry, that is responsible for this condition of affairs.

Standardization, to be enduring, must proceed on lines which shall be beneficial alike to the producer and user. It follows that any attempt to stereotype detail of design or construction must ultimately fail in its object. because such a course will not be adapted to the varying manufacturing facilities of different producers; nor will be acceptable to the user, since it must prove restrictive of constructional improvement and involve the buyer in paying a higher price for an article which the producer will decline to effectively guar antee. In other words, enduring mutual advantage to producer and buyer will only result if standardization be confined to ends or performance, and not to means or constructional detail.

Under the term "ends" or "performance" as opposed to "means" or "constructional detail" would fall the following:

- (a) Steam pressure.
- (b) Electrical pressure of generation.
- (c) Electrical pressure of distribution.
- (d) Periodicity of alternate current generation.
- (e) Sizes of generating steam units (say in convenient fractions or multiples of horse-power or kilowatts).
- (f) Sizes of mains, say in convenient fractions or multiples of a square inch or other unit).
- (g) Sizes of motors, and similarly as regards transformers, are and incandescent lamps, and essential fittings and accessories.

That much can be done in this direction is evidenced by the ease and rapidity with which, as regards electric traction, we have acquiesced in the standards of pressure, general construction, and types of motors, trucks and accessories, prevalent in America. There can be little doubt that had practical electric traction originated with us, instead of being an imported art from the United States, we would still be in the stage in which buyers' engineers would be creating different "standards" of their own composing, while every producer would be expected to manufacture and guarantee a corresponding variety of designs.

The author understands that most of the leading electric cable manufacturers in this country have already adopted, by agreement among themselves, certain standards in their own department of production. The question of standardization has also for some time received attention at the hands of the Electrical Engineering Plant Manufacturers' Association. Again the Municipal Electrical Association, a body thoroughly representative of the municipal user's interests, has given evidence of its readiness to co-operate with manufacturers in the direction of standardization of the commercial conditions of contracts for an electrical plant. Its representatives have met in conference representatives of the Electrical Engineering Plant Manufacturers' Association and have agreed upon certain general conditions as a basis for specifications of plant required by local authorities, and the outcome has undoubtedly been beneficial. It is evident, therefore, that the whole subject is ripe for consideration on the broader basis of harmonizing, by adequate representation and discussion, all sections of users' interests with those of producers.

6. It is not possible to enter in this paper upon the consideration of the actual formulæ which might constitute standards for the future. This is a very large and important question demanding much careful thought and discussion. The machinery for this purpose already exists, at any rate as a nucleus, in the Uniformity Committee of this Institution, appointed shortly after the submission of a highly suggestive paper on "Uniformity of Plant," by Mr. C. H. Wordingham, before the Municipal Electrical Association in the summer of 1898. But beyond a word of advice on the subject of standard periodicities, nothing has so far issued publicly from the deliberations of this committee extending over eighteen months. At this rate we may become irretrievably committed to many steps which all may live to regret, before effective results are obtained; for an unexampled expansion in every department of electrical engineering, notably those of electric traction and of power

distribution over extensive areas, appears about to take place in this country.

The author ventures to suggest that additional weight and acceleration to the work of the committee of the Institution would be given if it were strengthened by the addition of representatives of all interests concerned, viz., those of the manufacturer, user, consulting engineer, and user's engineer. The Institution might also encourage the submission of papers suggestive of standards for various classes of electrical engineering plant and accessories. These, together with the views which would be brought out in discussion, would serve as a valuable guide to a representative committee.

In conclusion, the propositions which the author has endeavored to establish may be briefly recapitulated as follows:

- (a) Standardization, to a greater degree than at present exists, is in the interest of the manufacturer; as a means of facilitating repetition production, and of meeting the competition of standardized foreign manufactures.
- (b) Standardization of "ends" or "performance" as distinct from "means" or "constructional details" is equally in the interest of the user; by securing for him low purchase cost, prompt delivery, freedom from the risks of experimental design, and full manufacturer's guarantees.
- (c) The relative absence of standardization in Great Britain, in contrast with other countries, is mainly traceable to the prevailing system wherein the user's engineer specifies "means" or "constructional details," instead of confining himself to "ends" or performance."
- (d) The determination of standards by organized effort, rather than by the slow and costly process of "trial and error," is desirable, and should be undertaken under the auspices of the Institution of Electrical Engineers, as representing the interests of both producer and user

## MARCONI AT THE ROYAL INSTITUTION.

(From our London Correspondent.)

On Friday, February 2, Mr. Marconi entertained a large company at the Royal Institution of London with a lecture on "Wireless Telegraphy." He dealt with some of the improvements which had been made during recent months. One improvement consisted of inserting the secondary of a transformer or induction coil in the coherer circuit, the primary being connected with the vertical aerial wire. This induction coil, the function of which was to increase the electromotive force of the induced oscillations at the terminals of the coherer, was of peculiar construction. Coils wound in the ordinary way were useless or even detrimental, but the coil he employed had its primary, contrary to the usual custom, wound with fine wire and its secondary with still finer. Moreover, the wire of the latter was not wound in uniform layers, but in a special manner calculated to prevent the effects due to electro-magnetic induction from being in opposition with the electrostatic induction at the ends of the primary. The efficacy of such a coil he tested during the naval manœuvres, and working between the Juno and the Europa, he found that, while the limit distance attainable without the coil was seven miles, over 60 miles could be obtained with certainty with the coil.

As to the distance of signaling, Mr. Marconi

said it varied approximately with the square of the height of the vertical wire and the square root of the capacity area placed at the top of the wires. With two installations having poles 150 ft. high signals were easily obtained at a distance of 85 miles, though according to a rigorous application of the law 72 miles only ought to have been obtained. It was noticeable in this case that, as the two stations were at sea level, there existed, between, them, a hill of water over 1,000 ft. high, owing to the curvature of the earth, and if the waves traveled only in straight lines, or if the effect was noticeable only across open space in a direct line, the signals would not have been received except with a vertical wire 1,000 ft, high at both stations. The lecturer proceeded to refer to the installations of wireless telegraphy that had been erected between the South Foreland and the East Goodwin light vessel, the South Foreland and Wimereux. But the most interesting and complete tests at sea, he said, were made during the naval manœuvres. The greatest distances at which service messages were sent then where 60 nautical miles between the Europa and the Juno, and 45 miles between the Juno and the Alexandra. That was not the maximum distance actually traversed, but the distance at which, under all circumstances and conditions, the system could be relied on for certain and regular transmission. During tests messages were sent to the distance of 74 nautical miles. Mr. Marconi said that six of his assistants had been sent out to South Africa. The war office intended that the wireless telegraph should only be used at the base and on railways, but the officers on the spot, realizing it could only be of practical use at the front, asked if the assistants were willing to go to the front, and accordingly on December 11 they moved up to De Aar. The results at first were not altogether satisfactory, owing to the lack of poles, kites or balloons, which were essential, but the difficulty was overcome by the manufacture of kites, in which they were assisted by Major Baden-Powell and Captain Kennedy, R. E. It had been reported that the difficulty was due to the iron in the hills, but as a matter of fact iron would have no more destructive effect on these Hertzian waves than any other metal, and he had been able to transmit messages across the high buildings of New York, the upper stories of which were iron. However, when kites were provided it was easy to communicate from De Aar to Orange River-some seventy milesand now there were stations at Modder River. Enslin, Belmont, Orange River, and De Aar. Two of his assistants volunteered to take instruments through the Boer lines to Kimberley, but the military authorities would not grant them permission as probably too great risk was involved. It seemed to him regrettable that installations were not established in Ladysmith, Mafeking, and Kimberley before the commencement of hostilities, but he found it hard to believe that the Boers had any workable instruments. Some intended for them, which had been seized at Cape Town, were of German manufacture, and not workable, and Mr. Marconi said that as he had supplied no apparatus to any one the Boers could not possible have any of his instruments.

A new automobile electric safety block signal, which will stop a train without the assistance of the engineer or motorman, is now being introduced. It is applicable to any style of motive power.

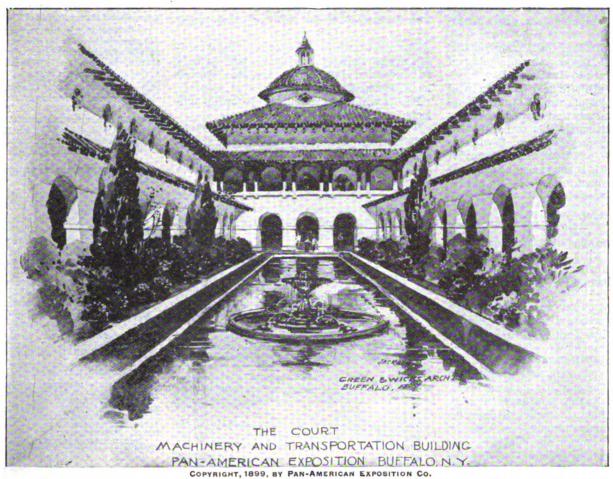

#### PAN-AMERICAN EXPOSITION BUILDINGS

The Court of the Machinery and Transportation Building of the Pan-American Exposition, which will be held at Buffalo, N. Y., on the Niagara Frontier, during the summer months of the year 1901, presents an interesting treatment of cloister work. The Machinery and Transportation Building itself forms a hollow square, with this Court in its center. It is 200

a pleasing frame or border effect; the water is low so as to receive the reflection of the growth around the pool.

The fountain is an important feature, placed in the center of the pool, and giving life to the scene and freshness to the atmosphere. Throughout the Court are pleasant walks and paths, bordered with low-growing shrubbery and plants, and at intervals at axis-points with the arcades, rare plants are placed in great a very free version of Spanish architecture—has suggested the name of the Plaza, which has been given it. The central portion of this square is occupied by a terrace only very slightly raised above the surface of the square, and surrounding a sunken garden, in the middle of which is a bandstand. The terrace as well as the garden itself will afford a large space for listeners who attend the concerts which it is proposed to give.

feet long and 100 feet wide, the east and west ends opening respectively to the great entrances from the Grand Canal and the Court of the Fountains, while the great exhibiting rooms of the Mall side of the building, and the Copyright, 1899, by Pan-American Exposition Co. vases, making a truly architectural landscape effect. The entire scheme gives the effect of an admirable enclosure of a mission cloister, and is planned as one of the many little oasis for the refreshment of the weary sightseer.

Outside, and at the north of the Plaza, is the railway and trolley station, from which it is supposed the greater number of visitors will enter the exhibition grounds. The railway station itself is masked by a colonnade flanked

two exhibition rooms and great entrance court from the Court of the Fountains side of the building, lie on either side. Along each side of this court, and extending the entire length, are roof-covered arcades under which the visitor may find pest on the comfortable benches.

The pool itself is 175 feet long and 27 feet wide. It is placed in the center of the court. The bank is sodded and planted on all sides, forming

COPYRIGHT, 1899, BY PAN-AMERICAN EXPOSITION CO

This building and court have been designed by Green and Wicks of Buffalo.

The northern part of the exhibition ground is occupied by a square about 500 feet from east to west and 350 feet from north to south. The buildings bounding three sides of this square and the arrangement of the square itself have been given to Messrs, Babb, Cook and Willard of New York, and the style adopetd—

at either end by two colossal arches, one for those entering the Exposition, and the other for those leaving it. This colonnade bounds the Plaza on the north. It is surrounded by a trellis, which it is proposed to cover with vines of various sorts.

The west side of the Plaza is bounded by a building, which is to serve as a large restaurant. The public pass through the lower arches of

this building, which are open, in order to reach that portion of the Exposition which corresponds with the Midway Plaisance at Chicago. The restaurant building itself is two stories high, and is about 350 feet long.

On the east side of the Plaza is a building closely resembling the restaurant, which serves principally as the entrance to the Stadium or athletic field, although portions are also used for exhibition purposes. This also has two stories, the upper story being a large open gallery, from which views of the Plaza on the one side and the Stadium on the other are afforded.

Finally, the south side of the Plaza is bounded by the Electrical Tower, the designing of which has been given to Mr. Howard.

The Stadium or athletic field has been in all its details a subject of careful study. It resembles in a general way that erected at Athens a few years ago, although this one can be, of course, only a temporary structure. It will contain easily 25,000 spectators, and is intended as a model of what it is hoped may be executed some day in permanent form.

# LEGAL NOTES.

Judge Gilmer has appointed W. G. Hurlbert receiver for the Niles Electric Company of Warren, O. Mr. Hurlbert gave bond for \$5,000. The receiver is directed to run the plant and to pay therefor out of any funds in his hands.

An important decision was lately handed down by the Appellate Division of the Supreme Court in New York City in a suit for refusal to give a transfer brought against the Metropolitan Street Railway by Chas. D. Mendoza. The complainant was awarded \$50 damages, the legal amount, by the lower court, but was reversed by the Appellate Division. The reversal was due to a technical defect in the complaint, which did not show that the line to which the transfer was demanded was actually leased by the defendants. The decision has an important bearing on the local transit and transfer system. It is especially important in that it holds that leased lines come under the provisions of section 104 of the rail-road law. This is diametrically opposed to a road law. This is diametrically opposed to a decision rendered last summer by Justice Maddox in Kings County.

The suits of the Thomson-Houston Electric Company and the General Electric Company against the Detroit (Mich.) Railway were discontinued, by stipulation, in the United States Circuit Court a short time ago. The actions arose out of the alleged infringement of certain patents and have been pending for some years.

An unusual case was recently tried in Rochester, N. Y., before Judge Murphy of the Rochester Municipal Court. Charles V. Thomson and Josephine Thomson appeared against the Western Union Telegraph Company. The plaintiffs, who are contractors for street improvements, alleged that a telegram sent over the Western Union wires was not delivered, and in consequence they lost a contract for paving a street in Elmira from which they would have realized \$800. Judgment was rendered in favor of plaintiff for \$169.81.

## Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended February 17:

Antwerp, 24 cases, \$2,792; Argentine Republic, 175 cases, \$13,042; Berlin, 57 cases, \$425; Brazil, 2 cases, \$19; Bremen, 1 case, \$15; Bris-

tol, 20 cases, \$15,000; British Guiana, 7 cases, \$68; British Possessions in Africa, 18 cases, \$2,-057; Central America, 8 cases \$164; Chili, 27 cases, \$518; Florence, 21 cases, \$2,452; Glasgow, 10 cases, \$1,000; Leith, 13 cases, \$982; London, 14 cases electrical carriages, \$4,080; 89 cases, \$5,204; Manchester, 4 cases, \$1,037; Marseilles, 269 cases, \$24,292; Naples, 1 case, \$66; Peru, 13 cases, \$507; Southampton, 7 cases, \$663; St. Petersburg, 2 cases, \$95; U. S. Colombia, 9 cases, \$217.

#### The American Street Railway Association Convention.

The nineteenth annual meeting of the American Street Railway Association will be held at Convention Hall, Kansas City, Mo., October 16, 17, 18 and 19,

Papers will be read on the following subjects:

"Double Truck Cars; how to equip them to obtain maximum efficiency under varying conditions."

"Construction, Operation and Maintenance of Roads that Operate 20 Cars or Less."

"Comparisons of the Various Systems of Electrical Distribution for Street Railways."

"Consolidation of Street Railways and its Effect upon the Public."

"The Store Room and Store Room Accounting."

"Painting, Repainting and Maintenance of Car Bodies."

#### PERSONAL MENTION.

Mr. John Rhall, chief engineer and electrician of the Union League Club, Brooklyn, N.Y., died on Friday. Mr. Rhall was a member of the National Association of Steam

Mr. Edmund F. Van Hoesen, of the class of '78 Rensse laer Polytechnic Institute, has recently been appointed chief engineer and superintendent of the Empire State Power Company of Amsterdam, N. Y.

Mr. R. M. Douglass, general superintendent of the Big Consolidated Street Railway System of Cleveland, O., has handed in his resignation, to take effect March 1.

Mr. Phillip Korst, who has been superintendent of the Badger Electric Light plant of Racine, Wis., for the past 11 years, has been appointed manager of the Janesville electric light plant, and will commence his duties at that place on

Deputy Commissioner Kerwin, of the Brooklyn Building, Lighting and Supplies Department, will inspect all electrical equipment of the Brooklyn Rapid Transit Com-

# COMMERCIAL PARAGRAPH.

## Ericsson's Swedish Desk Set.

The Ericsson Telephone Company, 296 Broadway, New York, say that their Ericsson Swedish Desk Set, illustrated herewith, gives one the luxury of telephoning. It brings

your correspondent to your elbow. It has a combined transmitter and receiver and a "cut out," which prevents office conversations being overheard through the 'phone. It is a complete instrument, with generator and bells, rings through 25,000 ohms, and is claimed to be the handsomest desk set

Send to the Ericsson Company for their latest catalogue.

#### INCORPORATIONS.

The Penn Power Company, Telluride, Col.-to furnish electrical power. Capital stock, \$100,000.

The Consolidated Electric Lamp Company, Danvers, Mass.-to conduct the business of renewing incandescent lamps. Capital stock, \$100,000.

The Electrical Development Company, Wilmington, Del.to deal in electrical and other vehicles. Capital stock, \$200,-000.

The South Jersey Water & Electric Power Company, Trenton, N. J.-to construct dams in Maurice River and Muddy run, in Cumberland and Salem counties. Capital stock, \$250,000. Incorporators: Charles K. Landis, Matilda T. Landis and Marcus Fry, all of Vineland.

The Colorado Springs Car Company, Colorado Springs, Col. —to generate electricity for power and other purposes in El Paso County, also to build electric railways. Capital stock, \$100,000. Incorporators: William P. Bonbright, William A. Otis and Leonard E. Curtis.

The Chesapeake Electric Company, Baltimore, Md.-to conduct a general electric supply, manufacturing, repair and contract business. Capital stock, \$20,000. Incorporators: Francis T. Homer and Benjamin C. Howard of Baltimore. County; Jacob I. Cohen and Allan M. Cohen, of Baltimore; Eugene Greenway, of Harford County.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A, MICHEL, Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all informa tion regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City. N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon pay-

ment of ten cents. When ordering give name, date and title of invention wanted.]

#### LETTERS PATENT ISSUED FEBRUARY 20, 1900.

#### ELECTRIC RAILWAYS AND APPLIANCES.

KLECTRIC RAILWAYS AND APPLIANCES.
643,709. Electric Suburban Car. Michael Brillinger, Toronto, Can., assignor of one-half to Isaac Newton Devins, same place. Filed Aug. 31, 1899.
643,730. Electric Switch. William T. Pringle. Primos, Pa., assignor of one-half to Edwin R. Keller, Philadelphia, Pa. Filed July 19, 1899.
643,742. Conduit System for Electric Railways. Leon Dion, Boston, Mass, Filed July 2, 1897.
643,854. Electric-Motor Wheel. James T. Whittlesey, Elizabeth, N. J. Filed June 28, 1899.

ELECTRIC LIGHTS AND APPLIANCES.

643,834. Electric-Arc Lamp. Christian J. Toerring, Philadelphia, Pa. Filed July 18, 1899.

ELECTRICAL MACHINERY AND APPARATUS. 643,758. Starting-Box and Controller for Electric Motors. Frank R. Blake, Boston, Mass Filed Dec. 8, 1899.

SIGNALS AND SIGNALING APPARATUS. 643,666. Signal System for Railways. King W. Mansfield and William R. Thompson, South Norwalk, Conn. Filed April

William R. Thompson, South Notwara, Coll. 6, 1899.

823. Motor Actuated Signal Mechanism. Thaddeus B. Keeler, Rahway, N. J., assignor to the Standard Railroad Signal Company, Arlington, N. J. Filed March 10, 1899.

824. Motor Actuated Signal. Thaddeus B. Keeler, Rahway, N. J., assignor to the Standard Railroad Signal Company, Troy, N. Y. Filed May 10, 1899.

864. Automatic Return-Signaling Device for Telephones, Franz Burger, Fort Wayne, Ind., assignor of three-fourths to Henry M. Williams, same place. Filed May 3, 1899.

## TELEPHONES AND TELEPHONE APPARATUS.

643,749. Telephone Directory. Lewis H. Mertz, Los Angeles, Cal. Filed Nov. 16, 1898.
643,830. Telephone-Transmitter. Alfred Stromberg, Chicago, 111. Filed Nov. 10, 1899.
643,993. Telephone-Transmitter. Charles E. Tucker and Louis S. Jenkins, York, Pa. Filed May 23, 1899.

# MISCELLANEOUS.

MISCELLANEOUS.

643,627. Transmitting device for Horseless Carriages. John C. Blevney, Newark, N. J. Filed May 10, 1899.

643,706. Telegraphic Safety Device. Selden R. Wright, Morton, N. Y. Filed Dec. 11, 1897.

648,722. Thermostat. Charles E. May, Dunedin, New Zealand. Filed Nov. 14, 1898.

648,744. Electric Heater. Gardner C. Hawkins, Boston, Mass., assignor to George E. Smith, same place. Filed March 13, 1899.

648,840. Combined Electrical and Tubular Organ-action. William B. Fleming, Detroit, Mich. Filed June 21, 1898.

643,855. Controller for Electric Automobiles. Chas. G. Burrows, Windsor, Conn., assignor to the Eddy Electric Manufacturing Company, same place. Filed Nov. 15, 1898.

643,880. Thermostatic Apparatus. Ludwig Morgenstern, Gottingen, Germany. Filed June 21, 1899.

644,029. Process of Electrodeposition of Metals. Sherard O. Cowper-Coles, London, Eng. Filed Aug. 28, 1899.

DESIGN.

## DESIGN.

59. Casing for Dynamo-Electric Machines or Electric Motors. Norman C. Bassett, Lynn, Mass., assignor to the General Electric Company of New York, Filed Jan. 18, 1900.

# GENERAL NEWS.

# What is Going On in the Electrical World.

#### LIGHTING.

Alpha, Ill.—Alpha business men are talking of a \$10,000 electric light plant, which shall light this place. New Windsor and Woodhull.

Alton, Ill.-W. Waples has been granted a franchise to erect an electric lighting plant here.

Amesbury, Mass.—The city council is discussing the question of erecting a municipal electric light plant.

Appleton, Minn.—The village council is considering the advisability of owning its electric light plant.

Arcanum, O.—The citizens of this place have decided to call an election to vote on a proposition to issue \$15,000 in bonds to build an electric light plant

Beaver Dam, Wis.—The franchise recently granted by the city for a new electric light plant has been sold to E. D. Lawrence, J. Martin and G. R. Congdon, all of this city.

Berlin, Wis.—E. L Draffen, president of the Municipal Construction Company of Chicago, has been here looking over the city to estimate the cost of a new electric light plant to meet the requirements for both commercial and plant illumination.

Blue Rapids, Kan.—A franchise has been granted to W. Lee Hall to put in and operate an electric light plant here.

Brampton. Ont.—Brampton's electric light plant, situated at Huttonville, four miles west of this town, was destroyed by fire a short time ago.

Carthage, Ind.—The trustees are considering the question of erecting an electric light plant.

Cartersville, Ga.—The city contemplates lighting the streets by electricity. Address Geo. S. Cobb, chairman

Creston, Ia.—The Creston Water Works Company has been discussing the question of establishing and conducting an electric light plant in this city.

Durham, N. C.—The electric light plant of this place was recently destroyed by fire. Loss \$25,000.

East Liverpool, O.—C. A. Smith, one of the wealthiest men of this city, intends to build an electric lighting plant here in opposition to the East Liverpool & Wellsville Street Railway Company, who now have the contract for lighting the city.

Evanston, Ill.—The first active move toward the establishment of a \$150,000 electric lighting and heating plant in this city was made recently by representatives of a Toledo company. The plant will be equipped with machinery to furnish light and heat to 300 houses.

Griswold, Ia.—A movement has been started to erect an electric light plant here.

Horseheads, N. Y.—The board of trustees of this village is discussing the question of an electric light and waterworks system.

McGregor, Ia.—A new electric lighting plant is contemplated for this city.

Morgantown, W. Va.—A proposition has been made to the council by Hon. Geo. C. Sturgiss to light the streets of this place with electricity.

Prairie du Sac, Wis.—The electric light plant in this city, owned by J. Miser, was lately destroyed by fire.

Raleigh, N.C.—An electric light plant will be installed in the penitentiary. Address J. P. Cilley.

Statesville, N. C.—This city will enlarge its electric light plant, installing a 1,200 light alternating incandescent dynamo and power to operate it. Address D. A. Miller, chairman of electric light committee.

Still Pond, Md.—An electric light plant is soon to be

Wappinger's Falls.—N. Y.—A proposition to bond the village for \$15,000 for electric light will be placed before the taxpayers at the annual election on March

Waverly, Kan.—Mr. Warner is interested in the building of a new electric light plant here.

Wildwood, Pa.—The borough council of this place has granted a franchise for the building of an electric light plant.

Wolfe City, Tex.--The Medlin Milling Company will establish an electric light plant in this city.

Woonsocket, S. D.—Arrangements are in progress to install an electric lighting plant at this place.

# STREET RAILWAYS.

Albany, N. Y.—The State Railroad Commission has granted the application of the Albany & Hudson Railway & Power Company for approval of its plans to operate its road by the overhead electric trolley system on that portion of its proposed line which is a street surface road, and by the third rail electric system on the portion heretofore operated by steam.

Appleton, Wis.—It is proposed to extend the Appleton-Neenah interurban to Kaukauna this summer.

Columbus, O.—The Columbus & Xenia Traction Company, incorporated by J. Little, A. Wickersham,

A. G. Carpenter and A. S. Frazer, proposes to build an electric railway from this city to Xenia.

Delaware City, Del.—The work of building the new electric railway from New Castle to this city will be commenced in March and completed by the first of

El Paso, Tex.—J. T. Terry of New York and others have purchased the Santa Fe Street Railway and will change it to electric power. It is about 4 miles long. Fayetteville, N. C.—W. McNeill and others have

ecured a franchise to build an electric railway at this

Flint, Mich.—The promoters of the proposed Flint-Fenton electric read will begin construction of the line next summer. It is also their intention to extend the line through Holly, Davisburg, Clarkston and Waterford to Ponting Waterford to Pontiac.

Kansas City, Mo.—The Metropolitan Street Railway Company will soon transform its cable roads for both Kansas Cities into trolley lines and the connections and extensions which it proposes to build this year involves the expenditure of two million dollars.

Ligonier, Ind.—Capitalists are formulating plans to build an electric railroad from Ft. Wayne to this town. P. A. Randall is at the head of the enterprise.

Malott Park, Ind.—The newest project in the way of an interurban electric line is the proposed road to Mt.
Nebo. If built the road will pass through Millersville
and this place, connecting with the Indianapolis line at the fair grounds.

Milford, Del.—The Delaware General Electric Railway Company has secured the right of way for its road between here and Dover, except where it crosses the farm of Mrs. Sarah E. Shockley near Cooper's Corner.

Mt. Holly, N. J.—The Moorestown Traction Company, composed mostly of Moorestown capitalists, has been incorporated at this place for the purpose of building an electric railway from Merchantville to Moorestown and thence here.

Myerstown, Pa.—Surveyors have lately been at work viewing the bed of the old Union canal. The object of the survey is said to be the construction of a roadbed for a street railway to connect Womelsdorf and this place, the last link but one in the vast chain of electric railways uniting all that section of Eastern Pennsylvania from Harrisburg to Philadelphia.

New Hope, Pa.—It is reported that William Jenks Fell, promoter of the Doylestown and Willow Grove road, is negotiating with capitalists for the purpose of building an electric railway between here and Doylestown on the New Hope and Centerville turnpike road.

Newark, O.—Application has been made for a fran-chise for the proposed Luncaster-Newark Electric Railroad, running through Hebron, Millersport, New Salem and Pleasantville.

Oshkosh, Wis.—The Citizens' Traction Company's properties of this city have been purchased by McMillen, Emerson & Co., of New York. The company is capitalized at \$500,000. Extensions and improvements are

Petersburg, Va.—The Southside Railway Company has decided to build several miles of extension to its electric lines in the near tuture.

Rossland, B. C.-C. S. Drummond, one of the direc-Rossiand, B. C.—C. S. Drummond, one of the directors of the British Electric Traction Company has been here from London, Eng. He proposes to construct an electric railway throughout the city and on Sophie mountain, a distance of 15 miles. The project is favorably regarded by the city authorities.

Salt Lake City, Utah.—A surveying party under Chief Engineer G. A. Gibbs have been surveying for the new Valley electric line from this city to Ogden.

Sterling, Ill.—Thos. Diller and T. McMillan of this city have asked the city council for a franchise permitting them to operate an electric street railway. They propose to lay 10 miles of track including a line to Mineral Springs Park.

Watkins, N. Y.—The village trustees have granted to C. W. Hathway for New York parties a franchise for the construction of an electric railway to Burdette.

Warsaw, Ind.—J. D. Wideman, a representative of the Logansport-Kendallville Traction Company, has petitioned the council for a local franchise to maintain and operate through all the streets and alleys of the town a local electric railway.

# COMPANY MATTERS.

Bay City, Mich.—The Bay County Electric Light Company's plant in this city has been sold to Bertram & Storrs of New York; consideration \$100,000.

Birmingham, Ala.—The Consolidated Electric Light Company has let the contract for additions to its power house in this city that will practically duplicate the plant. The additional buildings and machinery will cost about \$200,000.

Buffalo, N. Y.—In anticipation of a large traffic during the Pan-American Exposition, the International Traction Company has placed orders for 150 new cars, and contemplates ordering 150 or 200 later in the season. Altogether these cars will add over \$500,000 to the equipment of the company.

Colorado Springs, Col.—The Citizens' Light, Heat & Power Company, which recently secured a franchise from the city council, is having plans drawn and is making complete preparations to begin the erection of

its plant just as soon as the franchise is ratified at the coming election. About \$225,000 is to be expended in equipment.

New York.—One of the buildings in the group which occupies the entire block from 6th to 7th avenues, 50th to 51st street, used by the Metropolitan Street Railway Company, was considerably damaged by fire last week, which started in a repair shop of the electrical division on the second floor, and it is believed to have been caused by a poorly insulated electric wire. The loss will reach \$75,000.

Rochester, N. Y.—The Rochester Gas & Electric Company has purchased the Genesee Paper Company's Mill on the Genesee River, and the plant will hereafter be used as a power station.

be used as a power station.

St. Paul, Minn.—The \$300,000, which M. D. Munn, attorney for the street railway company, says will be put into new equipment for the street railway company this summer, will cover the cost of a large number of new cars for the various lines in the city.

Trenton, N. J.—The Trenton Gas & Electric Company will spend \$250,000 on its new plant, which will serve as a model to show prospective purchasers of electrical works and will be equipped with all the latest devices for furnishing electric light and power.

Worcester, Mass.—The Worcester Traction Company is to make a large addition to its power plant on Sutton Lane. It is proposed to add another large engine to the power plant and \$25,000 will be spent for equipment to produce additional power.

#### POWER AND TRANSMISSION PLANTS,

Charlestown, W. Va.—There is a scheme on foot by the manager of the Harper's Ferry Electric Light Company to utilize the splendid water power of the Shenandoah and Potomac Rivers at that place to gen-erate electricity and furnish Charlestown, Shepherds-town, Martinsburg, Winchester and other towns of the lower valley with power to run machinery, as well as supplying electric lights.

Denver, Col.—The largest of the proposed electric Denver, Col.—The largest of the proposed electric plants is that for which a site and water rights have been obtained on the St. Vrsin, and with which it is intended to supply this city, not only for lighting and power purposes, but for the operation of tramway cars. It is claimed that fully 50 per cent. of the present cost of lighting the city and running the cars can be saved by the use of power from this source, and the scheme is being carefully looked into by local capitalists.

### AUTOMOBILES.

AUTOMOBILES.

Indianapolis, Ind.—The National Automobile & Electric Company, headed by L. S. Dow and A. C. Newby, was incorporated with a capital stock of \$250,-000. The company has bought a tract of land at the junction of the Belt & L. E. W. Reilways and will have a large structure erected and doing business of manufacturing within 90 days. Models are now being constructed and every preparation is being made for a large business. Seven different types of automobile vehicles will be made. Electricity will be the motive power.—The Parry Manufacturing Company has decided to erect its new automobile factory south of the city. D. M. Parry, president of the company, says the work of constructing the buildings will begin early in the spring. The company expects to enter heartily into the trade next year.

New York.—A display of English automobiles was made at Fifth avenue and 27th street last week, in which there were seven machines of types that are not familiar here. They included a victoria, a couple of curious 'buses, a brougham, a des-a-dos, a brake, and a chara-banc that at a pinch will seat twenty persons. The vehicles all have gasoline motors, wooden wheels and solid tires. They are heavier and bulkier than the automobiles made here, but have a thoroughly made and business like look that is impressive. The largest vehicle and all the others, excepting one which has an internal gear, are chain driven. They have all been imported by the Anglo-American Rapid Vehicle Company, of which W. W. Gibbs, of Philadelphia, is president, while Francis D. Carley, of this city, is vice-president.—The New York Electric Vehicle Company has leased the store, No. 541 Fifth Avenue, for a term of years as a salesrocom for automobiles.

Reading, Pa.—Electric omnibuses are one of the pro-

Reading, Pa.—Electric omnibuses are one of the prospective delights of life in this city. The Oceanic Automobile Company has been incorporated with the intention of operating these 'buses in Scranton, Wilkes-Barre, Bethlehem, Easton and this place. The company will manufacture these contrivances and may erect their factory here. They propose to parallel existing trolley lines with automobiles.

Woonsocket, R. I.—It is stated that a Massachusetts corporation is planning to start a line of automobiles to run through the streets of this city, the purpose of which shall be to give to the people here a direct over-land communication with Boston.

# MINES, ETC.

Frisco, Col. -One of the most important enterprises is the generation of electric power for mining that will be inaugurated during the coming season at this place, which will be built by Ault & Wiborg of Cincinnati, owners of the Excelsior mine. It will be of more than ordinary importance, as it will generate more than 3,000 horse power and will, if necessary, supply power and light to Leadville. 25 miles away, and also a Breckenridge, 15 miles distant.

# THE TELEPHONE WORLD.

#### Rival Telephone Company in Washington.

The House Committee on the District of Columbia gave a hearing last week to persons interested in the operation of a rival telephone company in Washington. The projectors of this enterprise are known under the corporate title of the Washington Telephone & Telegraph Company. It was explained, however, that the company does not propose to enter the field of telegraphy. During the hearing, Chairman Babcock, after it had been brought out that the company was incorporated under the laws of New Jersey, stated emphatically that the committee would not look with favor upon any company that was not incorporated in the District of Columbia. He said that when the company was properly incorporated the committee would consider the application for authority to operate in Washington.

A number of Maryland people were present at the hearing, including ex-Representative H. W. Rusk, George R. Webb, W. J. Haywood, Harry Carr and H. W. Webb. The local branch of the company was represented by several residents of the District, including R. H. Johnson, Frank B. Noyes and E. P. Berry.

Mr. George R. Webb said that the capital stock of the company had been fixed at \$1,500,000 and argued that the standing of independent telephone companies in this country had been elevated recently. He added that there were 2,600 independent companies, and promised a guarantee of \$100,000 that the system would be promptly installed, the rates to be charged being \$48 and \$36 a year. Mr. Webb also claimed that more subscribers had been promised for the new company than the Bell Company now has in Washington. He likewise promised that the company would give any assurance that Congress might require that it would not sell out to the Bell Company when once its 'phones had been installed.

There were several others who addressed the committee, including Mr. Thomas W. Smith, of the Telephone Subscribers' Association, and Mr. J. J. Hemphill. There was a lively controversy toward the close of the hearing between Representatives Mudd, of Maryland, and Latimer, of South Caro lina, as to the time when the bill should be taken up again. Mr. Mudd insisted that the committee had not agreed to any thing, and Mr. Latimer insisted that the committee had agreed to consider the subject to-day (Wednesday) and it is expected that the new company will offer a revised bill for the consideration of the committee.

# Bell Movement in Iowa.

A gigantic movement has been organized and is being fostered by the Bell Telephone Company of Iowa to gradually absorb all of the independent systems in the State. Authentic information is to the effect that the Bell Company has been engaged for nearly a year past buying interests in the various lines, of which there are over 200, and that they eventually intend to absorb all city and toll lines. The managers of a number of these lines have become cognizant of this and they are at work forming an alliance by which they expect to be able to fight the Bell system. The Bell Company has already obtained possession of toll lines of the Ottumwa Company, seriously crippling the plant. Over \$3,000,000 is tied up in independent lines in Iowa and it will ruin many promoters if the Bell Company is successful.

## An Independent Exchange Sold.

The Independent Telephone Exchange of Lansing, Mich., has been transferred to the Grand Rapids Citizens' Telephon Company, the leading independent company of Michigan. It is understood that the Lansing stockholders exchanged their stock in the local company for an equal amount of stock in the consolidated company.

A meeting of independent telephone companies of Eastern Illinois and Western Indiana, was held recently at Terre Haute, Ind., to form a permanent organization. Charles R. Duftin and H. A. Coit, of Terre Haute, were elected president and secretary respectively. A committee was appointed to arrange a working agreement. Dr. Lumpkins of Illinois, president of the Illinois Independent Telephone Association and vice-president of the National Independent Telephone Association, was present. Ten Illinois and nine Indiana towns were represented at the meeting.

A new independent telephone company is being formed in the South, to be called the Virginia Telephone & Telegraph Company. A bill is at I resent before the Virginia Legislature for a charter that will permit the company to lay wires each city and town without the permission of the municipal authorities. The capital stock is \$5,000,000.

The Independent Telephone Association of the Carolinas was organized at Charlotte, N. C., last week. The organiza-tion represents 3,466 independent telephones and 1,479 miles of toll lines in North and South Carolina.

#### Will Meet the Bell.

C. E. Stinson, general manager of the Rochester (N. Y.) Telephone Company has just returned from Chicago where he went to purchase telephone supplies. Mr. Stinson says the Rochester Telephone Company is much alive, and doing a He says: "We have exchanges in towns roundabout. In Western New York towns there are various independent exchanges, and we hope some day to see them all united. We are building an exchange at Niagara Falls, and soon hope to enter Lockport. In the near future we expect to be able to offer to the people telephonic connections all over the State in addition to a splendid and economical city service. The independent telephone business is to-day by far the most active branch of the electrical industry in the United States.

Capital no longer hesitates to go into the business. large number of new exchanges are being established while existing ones are being extended, and in all quarters the independent movement is gaining strength. The number of first-class paving independent exchanges throughout the country is proof of the unqualified success of the movement. The exchanges now in operation rival in quality of construction, perfection of mechanical and electrical details and efficiency of service any of the Bell plants. By the opening of spring trade Rochester will have the finest independent telephone plant in the country."

## Philadelphia Councils Want Franchises Back.

Without a dissenting vote, the council's electrical committee of Philadelphia decided to report favorably to councils six ordinances repealing ordinances granting franchises to as many telephone and telegraph companies. The companies which will lose privileges if these ordinances are passed by councils Are: Mutual Automatic, chartered July 2, 1894; Philadelphia Standard, March 31, 1896; Clay Commercial, March 15, 1884; People's, June 10, 1886; Baxter Overland, December 31, 1883, and the Drawbaugh, July 18, 1898.

It is rumored that these repealing ordinances are for the purpose of clearing the docks for rivals of the Bell Company. It is said that already at least two of the late companies chartered, one in Trenton and one in Harrisburg, are quietly at work among the councilmen. As no opposition to the repealing ordinances has been met so far, no one doubts that the measure will pass councils. Then the opportunity will be given rival companies to press their claims. The Bell Company is also very active and is carefully guarding its interests.

## Battle for Telephone Franchises.

A battle royal between telephone companies is promised for the city elections in Rock Island, Moline and Davenport, The Bell companies have a majority in the councils of Rock Island and Moline and there is a strong element of that nature in the Davenport council. Two independent companies are trying to get franchises. The manager of the Tri-City Mutual Company said there would soon be begun one of the greatest newspaper campaigns that that part of the country ever saw in city elections.

Some days ago President Nieman was authorized by the Board of City Affairs of Cincinnati to enter into a contract with the Bell Telephone Company for telephones for that city's use for five years at \$60 per year for each instrument. When the contract was sent to Mayor Tafel for his approval the opinion of the Corporation Counsel was asked, and given, to the effect that no contract could be entered into for a period exceeding one year, but that the privilege of renewal might be incorporated in the contract. The necessary amendment will be made.

Grand Rapids, Mich., is the center of a telephone fight which promises to be to a finish. The rivals are the Michigan Company, now a part of the Erie system (Bell), and the Citizens' Company of Grand Rapids. With the latter are allied the independent telephone companies of the State, and it is the avowed intention of the independent companies to either cripple the Erie (Bell) Company in Michigan or to bring it to terms.

H. K. Cole, and other Minneapolis capitalists, have purchased the Evansville (Ind.) district telegraph plant, and franchises from the local stockholders with the view of putting in an independent telephone plant. They were advised that the franchise purchased would give them the right to operate a telephone system. The franchise in question has over twenty years to run, and gives the owners the right to use telephones and magneto-'phones,

The Wolverton Telephone Company has been organized at Dowagiae, Mich., with local capital, to compete with the Central, recently sold to the Erie Company.

#### A Competitor for the Bell in Brooklyn.

Within a few days the new telephone company, which has already begun operations in Manhattan, will open headquarters in Brooklyn and wage a war of competition against the Bell Telephone System. Already its canvassers for subscribers are at work, and the officers claim that they have met with fair success. The main advantages they offer over the Bell telephone are much lower rates, quicker and better service, and the absence of some of the disagreeable features which attend the work of telephoning now.

The concern in question is the Knickerbocker Telephone Company.

Its main office is at 100 Broadway, New York. Col. W. H. Eckert, who is a veteran in the telephone business, and who, it is said, organized and perfected the Bell system in Cincinnati, twenty years ago, and was later connected with the system in New York, is the president.

We shall have our system complete throughout Brooklyn by August," said Col. Eckert. "We shall establish a longdistance as well as a local service. Unlimited service on our lines will cost \$120 a year, and that means communication with all boroughs. The rates of the present company are \$240 a year, with an extra toll for service to Staten Island, Brooklyn, and some parts of the Bronx. For residences our unlimited service will be \$60 a year, while the present company charges \$70 a year for 600 messages. There will be a proportionate reduction in long-distance-rates. One of the main features of our service will be that each customer gets a direct wire, instead of having four or more on a line as under the present system.

"Every part of our equipment will be of the best, and this fact has in some instances caused delay. In the city our system will be all underground and each cable contains 400 metallic conductors, which are sufficient for 400 subscribers. are putting in a perfected central energy system, which is a great improvement over the one now in use. Our system does away with the uncomfortable buzzing in the ear, is the result of the present system when the receiver is lifted from the hook and placed to the ear. As a rule, I have not talked about our company in comparison with the old Bell system as we are simply working on our merits and expect to furnish a complete telephone system at a reasonable

We already have a large number of subscribers, not 10,000, as has been stated, but enough to begin busines with. Our solicitors are out every day getting more names."

## Telephone Rivalry.

The anti-Bell Telephone Company of Duluth, Minn., is completing the work of placing instruments, and will have its switchboard soon. They will have 800 'phones in Duluth and 500 in Superior, in their first book, now in the printer's hands. The city council has ordered the Bell Company to remove its poles and wires from the streets before April 1, and Manager Taussig says, in reference to the order: have rights, legal rights, to remain, and propose to do so." The facts are that the company was given a franchise for a specific period, which period expired last May; that the city has refused to extend its franchise for any time at any terms; that the city has notified the company that all improvements and extensions using the public streets and made subsequent to May 1 last, are at its own risk, and that the city has now ordered it off municipal property, in accordance with a decision of the United States Supreme Court. A stiff legal battle is in prospect.

Local moneyed men of Terre Haute, Ind., have organized a new telephone company and the work of constructing a new plant will begin in a few days. The company guarantees a rate not to exceed \$30 and \$18 per year for business and residences respectively. Much of the line will be underground.

President A. G. Wheeler of the Illinois Telephone & Telegraph Company is authority for the statement that the new Chicago exchange will be in operation by October 1. Nearly all of the independent exchanges included in the Independent Association are finished.

The Northwestern Indiana Telephone Company has completed and put in operation a local exchange in Hobart. The company has a number of patrons and is adding other phones daily.

The Edinburg telephone line, which is being extended southwest of Nashville, Ind., by the farmers along the line. will, it is said, be extended to Nashville. At present there is no telephone line in the county.

The Connersville Telephone Company, Connersville, Ind., has been incorporated with a capital stock of \$25,000.

# ECTRICA SECURITIES.

ELECTRICITY.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 152@16c.; Lake, 16@162c.; casting, 152@152c.

Reports from Brooklyn say there is no likelihood of a dividend on the stock of the Kings County Electric Light Company until July.

As indicative of the largely increased buying of bonds it is said that \$500,000 of the New York Heat, Light & Power Company's 5s were recently bought by a proment insurance company for 110½.

The latest quotations for some of the new industrial stocks, not given elsewhere are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 8½@9; New England Transportation, 6@6½.

At the annual meeting of the Canadian General Electric Company of Toronto the stockholders sanctioned the issue of \$300,000 in new stock, available to the stockholders at 125, at the rate of one new share to three old shares.

At a meeting of the directors of the Royal Electric Company of Montreal, held a few days ago, a quarterly dividend of two per cent. was declared. The same is payable on April 1st next to shareholders of record of February 28.

The New York State Railroad Commission has authorized the Rome City Street Railroad Company to issue a mortgage of \$2,000,000 on its property and franchises. The money is to be used for the improvement of the company's road and equipment.

The sale of the Bay County Electric Light Company's plant in Bay City, Mich., to Bertram & Storrs, bankers of New York, has been consummated. Consideration, \$100,000. The purchasers represent the syndicate which acquired the Bay City gas works one year ago.

The Board of Railroad Commissioners of Massachusetts has issued an order authorizing the West Roxbury and Roslindale Street Railway to issue \$262,500 of capital stock in addition to the present \$200,000, for the purpose of paying and refunding the floating debt.

It is recorted in Wall Street that prominent interests which were caught in Brooklyn Rapid Transit last fall have been evening up old scores in the Third Avenue fight. These interests have as a rule been arrayed on the bull side of the market, but it is known that they reversed their position temporarily during the past week. It is said that their opposition to the schemes of a speculative clique cost the latter about \$1,850,000.

N. W. Harrison & Co., bankers of Chicago, have purchased the first mortgage 5 per cent. gold bonds issued by the Indiana Interurban Electric Railway Company now building a line between Elkhart and Goshen. They are bringing them out at 102 and interest. The South Bond and Goshen franchises are unlimited and the ene at Elkhart runs to 1936. The total trackage is forty two miles. The combined population of the territory is 70,000.

Counsel A. B. Boardman, of the New York Rapid Transit Commission, predicts that the Metropolitan Screet Railway Company will operate the underground road. "I don't think I am violating any confidence when I say the Metropolitan Street Railway Company is the natural operating company for this new road. The company's lateral lines make it more valuable to it than anybody else and the laws of gravitation will land the road in the hands of the one naturally fitted to handle it—the Metropolitan Street Railway Company."

Stockholders of the United Railways & Electric Company of Baltimore, at their annual meeting, re-elected the directors as follows: Nelson Perin, Col. Walter S. Franklin, Alexander Brown. George C. Jenkins, Col. Seymour Mandlebaum, Henry A. Parr, E. L. Bartlett, William P. Harvey and George R. Webb. A statement given out by the company for the nine months ended December 31, 1899, shows: Gross earnings. \$3 402,200; operating expenses, including insurance, taxes, interest, etc., \$3,359 863; net earnings, \$42,337.

By the recent failure of the Armstrong & Bolton Company, which had the contract for supplying steam heating and electric light plants for the new City Prison on the site of the old Tombs. New York, the United States Fidelity and Guaranty Company is expected to lose nearly \$75,000. The Armstrong & Bolton Company's contract was for \$93 350. Since the company's failure the surety company, which guaranteed the contract to the amount of \$75,000, has authorized the architects of the prison to advertise for bids to complete the contract. Steam heating and electrical supplies have risen in price to such an extent that the bidders for the contract are unwilling to undertake it at less than \$160,000.

The Albany and Hudson Railway and Power Company. a consolidation of Hudson Street Railway, Hudson Light a Power Company, Kinderhook & Hudson Railroad, Greenbush & Nassau Electric, Citizens' Electric Light and Power of Hudson and Kinderhook Power and Light Company, is to build an electric line between Hudson and Albany, to be operated by the third-rail system; the new company, it is reported, will build a 10 mile connecting link between Niverville and Albany and also a new steel bridge at Rensselaer, 1,900 feet, long to cross the the New York Central and Boston & Albany railroads. It will also supply light and power along its route. The conversion of the entire system to the third-rail electric is now being made.

Third Avenue Railroad stock is just now the plaything in Wall Street. As we go to press (Tuesday afternoon) the stock is without friends in the Street and is quoted at 68—a drop of 8 points for the day. A scheme to induce John C. Crimmins, a "Whitney syndicate man," is now being considered by the stock holders. A representative of the syndicate made the following statement. "It is untrue that the amount needed to finance the Third Avenue Railroad Company is anything like \$50,000,000, as has been reported. The amount of the company's unfunded debt is \$23,000,000 If that sum is raised it will save the road from a receivership. There will have to be injected into the road though a large amount of money which will have to be raised by the stockholders, as it will take \$8,000,000 to put the company's system into complete running condition, this amount being entirely distinct from the money required to meet the company's unfunded debt, which the bankers' syndicate will arrange to advance if it undertakes the financing of the debt." It was intimated that the representatives of the company's stockholders would have to show that they could raise the \$8,000,000 before the syndicate would undertake to finance the company's big debt. The representative of the syndicate said that there had been an ultimatum delivered under which the company has until this morning to raise the guarantee fund of \$8,000,000. John E. Parsons has resigned as a director of the Third Avenue Railroad Company. He was one of its oldest directors, and originally became a director through having acted as counsel of the company. Mr. Parsons made a statement Mouday in explanation of his resignation. He said that he had urged first that in order to obtain the money needed there should be an issue of stock and later that the proposed arrangement with Kuhn, Loeb & Co. should be made and that both courses having failed it seemed to him right that the new interests that had entered the company, which interests were represented by W. H. Curtiss, should have th

# EDITORIAL NOTES.

The Cook **Elevated Electric** 

It is an apt saving that "Necessity is the mother of invention," and conse-Railway System. quently invention being the outgrowth of necessity,

it so happens that in various parts of the world peculiar types of electric railways have been built owing to peculiar or unusual topographical conditions. As an example, between Elberfeld and Barmen, in Germany, there is an aerial electric railway, the route of which lies directly over the bed of a river, the track being upheld by means of inclined girders placed at intervals in either bank of the stream. Th method of construction was found necessary owing to the difficulty of obtaining rights of way, as well as to the fact that objections were urged against the obstruction of the river to navigation.

In England a single rail electric railway, the invention of Mr. Behr, will, in all probability, be built in the near future between Liverpool and Manchester, with a view to obtaining a speed of ninety miles an hour, while in this country preliminary steps are now being taken, looking to the construction of an elevated electric railway between Milwaukee and Chicago,

This elevated road, the invention of Mr. L. F. Cook, differs materially from the elevated railways to be met with in Chicago and this city, in that the plan of construction contemplates a steel column with a truss on either side and a boxed girder upon which there is a trough track on which the wheel that holds the car in suspension runs. In other words, this system resembles in some respects the German road already referred to, as well as the invention of Mr. Behr, yet it differs entirely from them.

The Cook system was given a thorough trial in Tacoma, Wash., a few years ago, and proved, so it is claimed, a success. Some 800 feet of track was built elliptical in form with curves of seventy feet radius, and with grades ranging from 5 to 10 per cent. With a car driven by a fifteen horse-power motor, fifteen people were carried at the rate of forty-five miles an hour. One advantage of this system is that snow storms can not interfere with the operation of the cars, as is frequently the case with surface lines, but on the other hand as the cars are quite narrow, there would scarcely seem an abundance of room for passengers, which would

likely necessitate a large number of cars being

A company has been organized with a capital of \$50,000 to construct one mile of road in Milwaukee, which if satisfactory will be ultimately extended to Chicago. The principal advantage of such a road would lie in the fact that a much higher rate of speed could be attained than is now possible with the steam surface line. Under ordinary conditions, a car could travel at the rate of sixty miles an hour, but after the line is completed and the details perfected an even greater speed is hoped for by the inventor.

\*

As anyone who studies A Trade the progress of nations Worth Securing. can easily perceive, the producing capacity of the

United States has now reached a stage which far exceeds the consumption, and the ratio of excess is assuming greater proportions year by year. It is therefore imperative for the manufacturers of this country to look beyond its borders for markets wherein they can profitably dispose of their goods. Our geographical position points out the vast Empire of China and the continent of Asia, with its yet undeveloped trade, as pre-eminently ours. The rapid growth of United States trade with China, coupled with recent developments in that part of the world, seems to warrant the presentation of some facts bearing upon present commercial conditions in that vast territory. Comprising as it does one-twelfth of the land area and nearly one-fourth of the population of the globe, it is not surprising that events which indicate a marked change in its business condition or the methods of its people should attract widespread attention.

With reference to the electrical trade of this country with China, the official statistics show that the exports of electrical machinery increased from \$1,868 in 1898 to \$17,548 in 1899, while those of telegraph, telephone and other electrical instruments and apparatus increased from \$31,199 to \$34,135. These figures would seem to indicate the practicability of greatly extending the sale of American electrical apparatus in China. Manufacturing in that country is likely to assume an important position and aspect in the near future. The treaty of Shimoneseki, which followed the war between China and Japan, permitted the introduction of foreign machinery for manufacturing purposes, and gave to the Japanese many rights

as manufacturers which did not formerly exist, but which under the "favored nation" clause of other treaties were thus granted to representatives of all nations having treaties with China. The result of this has been a rapid enlargement of the manufacturing industries of China, the introduction of modern machinery, electric railways, electric lights, telephones, and many other features tending to quicken enterprise and develop manufacturing. This development is as yet very small with the population of that vast empire and with its demands, but that it is the seed which may prove the beginning of elaborate industries is evident, and electrical manufacturers will do well to thoroughly cultivate so promising a market.

To be successful in China our manufacturers must have a fuller knowledge of its requirements and be in close touch with its people. The attention of our manufacturers cannot be too urgently called to the importance of studying the requirements of the market for which their goods are intended, and of closely following minute details, which greatly accounts for the success of our European competitors. An important matter is that of trade-marks, for the Chinese lay great store or worth on brands, In short, if we intend to secure our share of China's trade, it is of vital importance that we should at all times be prepared to cater to it.

The question has often been propounded as to which is the best means of bringing American manufactures before the notice of the the Chinese. There is no better medium than that so successfully adopted by our European competitors, viz., through the intermediary of the great commercial houses long established in China, many of which are bending their energies to extend their American business, but find comparatively little support from manufacturers in this country.

# Can the Waves of the Ocean be Harnessed?

For several years now or since electrical machinery has reached a high state of development in-

ventors all the world over have been endeavoring to perfect some type of apparatus for utilizing the power of the tides or the force constantly exerted by the waves of the ocean. From time to time in these columns we have referred to the progress that has been made along these lines and have described some of the experiments made with the Wright wave motor, the Bunnell wave motor, the Rider motor and others. All of these devices were designed to utilize the lifting power of the waves, but now we hear of another device invented by Mr. Stephen H. Emmens and designed on an entirely different principle. The general character of the arrangement is described by the inventor as follows:

"The idea is not a new one, by any means. I have had it in mind a good many years, and I do not claim that it originated with me. It first occurred to me some thirty years or more ago when I was visiting Kilalea, on the west coast of Ireland. At that point the Atlantic billows have worn a funnel shaped opening into the rocks. This opening, growing narrower as it penetrated further and further into the rock, concentrated the power of the waves until at length they broke an opening upward to the surface of the rocks above. Now, when the sea is heavy the waves rush in there with

such power that a column of water and spray is thrown nearly a hundred feet into the air.

"Looking at this spectacle, it occurred to me that here was a magnificent natural power, and in a form to be easily available. I did not give the matter any particular attention at the time, and, although I retained an interest in the subject, I was too much occupied with other matters to take it up with any thoroughness. Recently, when I became interested in the development of liquid air, my mind again reverted to the project of utilizing wave force, because I saw that it afforded a cheap and desirable means of manufacturing such power as liquid or compressed air. As a result I have worked out my present plan.

"Briefly it is this: After a desirable site has been selected, a channel will be constructed leading back from the water front. Following nature's suggestion, this channel will be funnel shaped, with retaining walls that approach each other as they lead back from the shore. Thus the power of the waves as they enter the aperture will be concentrated as they advance, and at the point where it is to be applied we get the same amount of power within a smaller compass.

"For example, suppose the channel at the sea end to be fifty feet wide. I have estimated that, with waves of very moderate force, there will be two horse power per lineal foot front of wave. In other words, our fifty foot opening gives us a hundred horse power. The retaining walls narrow the channel down to a diameter of, say, ten feet at the point where the water enters the race from which it is to be applied. Here we have the same horse power with a smaller frontage. With the figures I have used in illustration it would be ten horse power per foot."

To erect suitable plants and on the strength of a series of tests made at Asbury Park, N. J., on a comparatively small scale, a company has recently been formed with a capital of \$1,000,000 and known as the Wave Power Company. The principal assets of the concern are Mr. Emmens' patents, but in order to demonstrate the practicability of the invention a good size plant will be constructed—probably the coming summer—either at Monmouth Beach or Far Rockaway.

As is well known the great drawback to the majority of wave motors heretofore brought out, has been the difficulty of devising suitable means for regulating them or for causing them to generate power uniformly and evenly and not spasmodically. That Mr. Emmens appreciates this is evident, for in referring to the fact that wave power is not constant, he says:

"This fact may limit the usefulness of wave power for certain purposes. On the other hand, the use of the waves is particularly applicable to the production of power in forms that can be stored, and such forms are coming more and more into use. For that matter the surplus energy accumulated during times of storm or high waves may be stored either in the form of water or as manufactured power for uses during periods of calm. I expect that the plan will bring about not an industrial revolution, but an important addition to our methods of developing cheap power for commercial use."

There is scarcely any doubt but what the day is not far distant when it will be possible to harness the ocean in the same way that waterfalls were brought into commercial use, and on that account practical tests of devices for accomplishing this purpose will unquestionably be watched with interest.

# UNDER THE SEARCHLIGHT.

### Notes and Comments on Various Topics.

INVENTORS are now said to be at work designing fenders for automobiles. Just why automobiles should be provided with fenders when spirited horses have no net scoop in front of them is difficult to see.

AT a recent meeting in London of the Marconi Wireless Telegraph Company it was denied that the patent rights of the system had been sold in America. An agreement, it was alleged, had been reached, but not executed.

A BILL has been introduced in the Reichstag of Berlin, Germany, providing punishment for the theft of electric power. Such a bill ought scarcely to be necessary in an-up-to-date community.

THE following bulletin, "Latest from the Front," was recently circulated in Wall Street: "General Cronje-Keene, the hero of Sugar, the great strategist of General Electric, the conqueror of Cordage, the destroyer of Whiskey, the lifter of Lead, the defender of Leather, the consumer of Tobacco, the protector of Brooklyn Rapid Transit, the butcher of bulls, is now completely surrounded in the Third Avenue laager. About \$3,000,000 worth of his ammunition has already been blown up (or in). Reinforcements under Field Cornet Lamar have been repulsed, with heavy loss, and Gens. Roberts-Rockefeller and Kitchener-Whitney have refused to grant any armistice and notified Cronje-Keene that they intend to bombard him into unconditional surrender to avenge sundry financial Majubas."

From the news received from South Africa it is clear that telephones are being largely employed for communication purposes by the British forces on active service, says the London "Electrical Engineer." At Ladysmith the outlying positions are connected by telephone with headquarters, and this connection proved of great service when the town was attacked last month. At Mafeking also, Colonel Baden-Powell has a telephone service arranged with all his outposts, so that he receives quickly the information of any move on the part of the surrounding forces. The latest news, however, is from a letter from a private soldier in the Grenadier Guards, to the effect that a Boer spy has been found to be using telephone communication from a bouse within the English lines at Modder River, presumably to the Boer position. The end of that spy is said to have been as sudden as the switchingoff operation in a telephone exchange.

ACRITICISM of the multiple-unit system of railway propulsion by Mr. George Westinghouse has brought out the following reply from Mr. Frank J. Sprague, which appeared in a recent issue of the N. Y. "Herald": "The letter from Mr. George Westinghouse in a recent issue of the "Herald," incidentally supporting a suggestion to use in the rapid transit tunnel steel motor cars on which to concentrate all the power necessary to operate a train, seems really to have been an attack on what is now known as the multiple-unit system of train operation, that is, the simultaneous control from any selected point of two or more equipped cars in a train, which system I first introduced on the South Side Elevated in Chicago. The plea advanced is that of danger from fire.

It is a pity Mr. Westinghouse is so pessimistic, and in view of the demands of modern transportation and the development now being made to meet those demands, he seems somewhat ingenious. Those demands are essentially the movement of cars in trains of various lengths at high schedule speeds, and at such frequencies as will meet the needs of traffic. The existing or proposed equipments for the new and old Berlin elevateds, the Liverpool Overhead and the Waterloo and City Railways, London, the Brooklyn, Boston and probably the Manhattan elevateds, all call for two or more separate motor equipments in a train. Hence it would seems that the engineering world did not agree with Mr. Westinghouse, With one unimportant exception the fires which have occurred on elevated electric cars have been when large powers were concentrated on a single car, which has been overworked, and were partly due to early inex perience in wiring."

The royal vaults under the Albert Memorial chapel at Windsor Castle have been lighted by electricity.

An arch surmounted by a reproduction of the latest type of automobile is soon to be erected at the extremity of the Avenue de la Grand Armée in Paris to the memory of Lavassor. Lavassor did much to promote the interests of the automobile. This is doubtless the first instance of the introduction of the motor vehicle into sculpture.

In the laundry of an insane asylum at Pontiac, Mich., electric irons instead of gas irons have proved to be peculiarly adapted for insane asylum service, where most of the work is done by the patients. There is no chance of setting anything on fire with the irons, which are kept at an even temperature and do not-require the exercise of judgment in changing them.

A NOVEL use has been found for an electrical stove by the water board of Marquette, Mich. The stove has been put in the intake pipe which supplies the water to the city works from Lake Superior, and its purpose is to keep anchor or needle ice from forming on the sides of the pipe and finally stopping the flow. The stove is the invention of the superintendent of the local electrical plant. It is a resistance coil like those used for heating street-cars, and is made in circular form to fit within the intake pipe, the water passing through it. Current is furnished to the stove at slightly above 100 volts, and the plan is to keep it in constant operation when weather conditions are favorable for the tormation of needle ice. It is not necessary that any great quantity of heat should be generated, a rise of two or three degrees being sufficient to melt the ice as fast as it forms. The cost of the apparatus is \$25, and this expenditure will save at least \$100,000 for a new and deeper intake.

In Moscow, Russia, the city authorities were recently a little dubious as to the merits and advantages of electric traction for street railways. Accordingly the local tramway company installed a storage battery system on a short section of its line for the purpose of demonstrating the possibilities of electricity for this purpose. This proved very successful, and they then very speciously suggested the introduction of a mixed trolley and storage battery line; but the authorities are now said to be holding out for a conduit system.

A CABLE dispatch states that the Uganda railway telegraph line reached Ripon Falls on February 19, thus establishing communication between Lake Victoria Nyanza, the source of the Nile, and London.

A COUPLE in Binghamton, N. Y., were recently married by phonograph. It had been decided that the bride's father, who was a clergyman, should perform the ceremony, but during his absence in the South he was taken ill and died before his daughter's return. Before expiring however he recited the marriage ceremony into a phonograph and the cylinder was made use of later to unite the couple.

THE New Haven (Conn.) Railroad Company will soon have an electric feeder for its steam line. One of the branches of the road, running from Attauwaugan to Dayville, will connect at the latter place with the steam lines of the company, and be operated largely for freight by an electric engine hauling five freight-cars of the ordinary size. This will be the first attempt of the New Haven Company to adapt a trolley line to freight as a feeder of a steam road. The new trolley system, of which several miles are already in operation, as an original enterprise is one of the largest in Connecticut, and has the novelty of construction with the main object of feeding a steam road instead of competing with it.

L. S. GARDNER, of New Lisbon, Wis., referring to his electric gun, says: "This weapon promises a deadliness beyond the most horrible dreams of warfare. It is built along strange lines. Instead of being pushed out from the breech, the projectile is pulled out through the muzzle by a system of powerful magnets and spit into space at a velocity regulated by the wishes of the operator. The gun is open at both ends, and the projectiles may pour from its muzzle as fast as they can be fed into the breech. There is no recoil, and a tube of glass would serve as well as one of steel. Indeed the model of this wonderful weapon is made of glass." Mr. Gardner is now in the East seeking capital, but it is doubtful if he

It is quite evident that the Germans are upto-date in all matters pertaining to science applied to industry. In Bavaria an association of farmers has been formed for the purpose of erecting large electrical works to be devoted to agricultural uses. The current requires for its production a force of 150 horse power, which is supplied partly by steam and partly by water power. Several villages are supplied, while farmers are furnished movable electrometers for threshing machines, chaff cutters, etc. Every farm in the district is connected with the plant.

BICYCLE riders have often wished for some handy little motor attached to the post of the machine that would do the work of propelling. Such a device has been designed. It is, in fact, a two-wheeled automobile, with pedals attached as in a bicycle, for use when wanted, and a full horse power motor mounted on the front part of the frame, the forks being doubled to give sufficient strength. A fuel tank, or carbureter, is attached to the top tube of the frame. The ignition is by an electric spark—an improvement over the former motors. Sufficient fuel can be carried for a seventy-five-mile run. The speed is from fifteen to twenty-two

miles an hour. The pedals are on the "free-wheel" combination, and are needed only in starting or on very steep grades, as the motor is sufficiently powerful to carry the rider on any ordinary road. The motor weighs twenty-two pounds, bringing the total weight of the wheel up to about sixty-five pounds. The brake is applied from the front handle-bars by a hand-break on the rear hub. The motor can be instantly disconnected.

ITALY has made up its mind not to be behind hand in matters electrical and as a consequence numerous important undertakings are on the eve of being started. Among others a central power station to supply an electric railway is projected at Bassignana, while an electric trolley road to connect Milan and Varese has received the sanction of the Government.

Last week the Creusot gun works in France were destroyed by fire resulting in the loss of a large amount of gun material and electrical stores. It was at these works that the Boers obtained a large number of their cannons.

The Bergen County Traction Company which operates between Fort Lee and Englewood, N. J., is experimenting with a new headlight on one of its cars. The light is produced by means of an electric arc and is of 3,500 cp., so it is claimed. With this type of headlight a motorman has at night a clear view of the track for at least two hundred yards ahead of the car.

THE Jenkins underground electric system, invented by a Richmond electrician, was recently tested in Baltimore and proved a complete success. It will probably be adopted on some of the lines there.

Argangements for equipping the Manhattan Elevated Railroad in this city with the third-rail system are rapidly progressing. Mr. W. E. Baker, of the engineering construction department, is responsible for the statement that much of the contract work has been completed and only scarcity of material and lack of sufficient skilled labor will delay the installation of the system.

UNTIL recently the experiments made to sterilize liquids by means of electricity have failed, says the "Electrical Engineer," London, because the application of continuous current decomposes the liquid and thus renders it useless, while alternating currents of the frequency usually employed are not sufficient to destroy the microbes which are the cause of the fermentation against which a remedy is sought. According to a writer in "El Telegratista Espanol," by the name of Meritens, all microbes in wine can be killed in a few seconds by the application of alternating currents of high frequency and low potential, which at the same time conduces to conserve the wines. Mr. Meritens has made an apparatus which consists of a narrow glass tube through which the wine to be treated passes. Inside the tube there is a series of metal disks. These are insulated, and each is in communication with one of the terminals of an alternating-current dynamo. The speed of the liquid is regulated by a valve so that it can be subjected to the action of the current for any given time. It is said that the invention has proved of considerable commercial value.

# NOTES ON ELECTRIC TRACTION UNDER STEAM RAILWAY CONDITIONS.\*

BY EDWARD C. BOYNTON.

On many of the large steam railroad systems in the United States, there are certain sections which present the most favorable conditions for the substitution of electricity for steam as a motive power. These conditions are the result of increasing density of population, and mean that better and cheaper transportation facilities are needed by the public than are provided by the steam road.

The electric street railroads quickly took advantage of these conditions, and by building lines more or less parallel to the steam roads, soon acquired a large share of the local passenger traffic. The fault with the steam road was not that the motive power was steam, but the fare was too high and the train service too infrequent. The whole question of the substitution of electricity for steam hinges upon that one point.

In order to provide satisfactory transportation facilities, the steam road must double or quadruple the number of its trains, and reduce the fare to at most one cent per mile. When there is sufficient density of population, this will surely cause a large increase in the number of passengers carried. This increase is due principally to the fact that many people who could seldom afford the expense of traveling would then make frequent trips. It is very doubtful whether the greater number of steam trains can be operated at a sufficient profit with the low fare. Here, then, comes in the change in motive power, with the sole purpose of decreasing the operating expense.

I wish to call attention to two classes of local passenger traffic which should be considered as distinct from each other. The suburban traffic of a large city is well understood, and its characteristics are usually such as would make the change from steam to electricity profitable. The low fare will induce a part of the population to make their homes in the suburbs, and thus increase the travel. But where there are competing trolley lines, the steam road, which we will suppose has electric motive power, needs one more facility than those mentioned, and that is, high speed. Without that, there would be little advantage over the competing lines.

It has been proved by experience that the speed must be at least as great as an average steam train, and there is no doubt that if the speed be made as high as the fastest steam express train, the popularity of the line would increase. It is well known that the business man who desires to travel from one city to another, or to and from his residence and his place of business, cannot be carried there too rapidly. It would probably surprise the average passenger on one of the fast steam express trains to be told at a certain time that he was traveling 70 miles per hour, and yet such speeds are reached every day, for short distances, over a straight, level track.

The other class of traffic referred to is that existing between cities and towns in close preximity. Let us assume a case as an example.

In a certain densely populated manufacturing State, there is a city larger than any other within fifty miles radius. Within that radius are several towns and small cities not over twenty to thirty miles from the larger city.

These are connected by the steam road, which maintains what is considered a reasonable train service, and one that is as frequent as the traffic seems to demand, at the rate of fare charged, which is from two to two and onehalf cents per mile. The trains are quite heavy, nearly always fully loaded, and are run from two to three hours apart. Together with its freight traffic, such a road pays well, judged from the steam road's standpoint. Suppose that electricity be substituted for steam in that section, and a train service consisting of two, or three car trains running every half hour from each end, with a maximum speed of fifty to sixty miles per hour, and the fare reduced to one cent per mile. There is no doubt in the minds of those who have watched the development of such cases, that the increase in traffic and low operating expenses would result in a far greater profit than was ever earned by that section of the road. It is well-known that such conditions exist on our steam railroads in many localities.

It has been said that the steam roads will begin by equipping their branch lines with electric motive power, and little or nothing is heard of the equipment of the main trunk line. It is necessary to define what is meant by a branch. In a large system some branches are 100 miles long and may be double tracked: others are from 6 to 40 or 50 miles in length. In the assumed case described above, the conditions may exist on one of the large branches or even on the main trunk line, which may have four tracks. It should make no difference in deciding the question of equipping the part of the system which possesses the desired conditions, whether it is on a branch or a part of the main line. It should be fully understood that no steam railroad will equip any portion of its lines, except with the provision that nothing shall be done which will prevent the running of steam and electric trains over the same track.

## THE QUESTION OF EQUIPMENT.

The questions, how much will it cost to equip a given service to be operated by electricity?-and how much will it cost to operate it? are frequently asked. The electrical engineer is now in a position to answer both these questions with great accuracy. The experimental stage has passed, and sufficient data is at hand to give all the information needed. It must be realized that the operation of a steam railway by electric power introduces many conditions which do not exist in the transportation problem within a great city, such as are operated by the elevated or surface street railroads. There are no restrictions on speed or weight of trains. Rapid acceleration is not of so much importance, for the stops are much further apart. The trains must be operated under steam rules absolutely, and the whole equipment must comply with the laws relating to steam railway trains. The railway company contemplating the equipment of a part of its system with electric motive power has the choice of several methods which should be closely studied to determine which is best suited for the service it is proposed to operate.

These methods are:

First—The purchase of electric locomotives of sufficient power and weight to haul its standard passenger coaches.

Second—The equipment of a number of its standard coaches as motor cars.

Third—The purchase or building of a sufficient number of special light passenger coaches, some of which are equipped as motor cars, and the withdrawal of its standard coaches entirely from this service.

Fourth-Shall freight be hauled by electricity or steam?

The use of electric locomotives for the purpose under consideration depends upon several conditions. If the travel is heavy, that is 2,000,000 passengers per year and upward, the service frequent, the speed high, requiring an average train of four cars, and as may be the case. the same coaches must go much further than the electric service extends, hauled by steam, it is advisable to use electric locomotives hauling standard coaches. Their principal advantages lie in their ability to perform the work of a steam locomotive in every respect, and this is frequently a strong point in their favor with the railway managers. They are thus able to accommodate themselves to congested traffic which usually occurs on holidays and possibly at certain times every day, by simply increasing the number of coaches hauled as is the practice with steam locomotives. Such locomotives should weigh from 100,000 to 150,000 pounds, should have eight wheels and four motors, so that the total weight is available for traction. They must be provided with sufficient power to haul at least double the average train without over-heating. They must not only be able to perform the work of a steam locomotive in the same service, but should do it at a faster schedule speed. The rapid acceleration of a train hauled by such a locomotive enables it to perform the above duty without any increase in the maximum speed. In switching cars, the ease and rapidity with which the electric motor can be handled is a great advantage.

It is necessary to equip these electric locomotives with the best automatic air brake system that can be obtained, for several reasons. They must operate the existing brake system on the coaches as well as the steam locomotive does. The law requires automatic brakes and a whistle. An independent motor compressor with a large main reservoir is therefore almost imperative.

The cost of repairs on an electric locomotive should be exceedingly low, possibly 10 per cent, of that required by a steam locomotive on account of the fewer moving parts and the entire absence of the boiler and its necessary equipment.

The fact that an electric locomotive requires but one set of controlling and air braking apparatus is a distinct advantage over other methods of employing electric motive power. This is evident, not only in the first cost but in the fewer parts to be cared for.

The second method of applying electric motive power to an existing steam railway; the equipment of standard coaches as motor cars, will appeal to all steam railway managers as the cheapest and most convenient way to make the change. This method has strong arguments in its favor.

The locomotive carries its own paying load and during the hours of light travel can be run light, without hauling other coaches. A standard coach equipped with two motor trucks and four motors will haul nearly as many coaches as the locomotive above mentioned and will weigh 100,000 lbs. It will easily handle five coaches making a six car train weighing loaded 450,000 lbs. I believe that the power consumed per passenger carried in a train hauled by an electric locomotive will be less than if all the cars were motor cars, whether run singly or in one train.

<sup>•</sup> Abstract of paper presented at the 140th meeting of the American Institute of Electrical Engineers, New York, February 28, 1900.

Let us see exactly what must be done to a standard coach to equip it as a motor.

In most cases the conditions will be such that three or four car trains with a proper schedule will be sufficient to take care of the maximum traffic. This necessitates only two motors for the coach, These should both be mounted on one truck, and this truck complete with motors will have to be purchased and used to replace one of the standard trucks. The motor truck should be built especially for the purpose, a heavy steel truck, 36 to 40-inch steel tired wheels, brakes of the type that do not require brake beams, springs both elliptic, and equalizer of sufficient strength to support the weight of half the car body with maximum load, and this means all standing room occupied. The size and general design of the axle in the motor truck must be carefully considered. The author does not believe that steel axles 5" maximum diameter between wheels, are safe. It may be that in calculating their strength and considering the enormous strains which they must withstand, the result appears satisfactory, but experience shows that the excessive vibration at high speeds will cause crystallization of the steel and a high factor of safety must be employed.

The wheel journals should be at least 5\(\frac{1}{2}\)' x 9", and the diameter of axle between wheels 6\(\frac{1}{2}\)', with a larger diameter through the axle gear.

The wheel base cannot well be more than seven feet, on account of the curves, but it is nearly all needed in order to obtain room for motors of sufficient size. The motor should not be supported by the truck frame in any way.

Steel bars should be placed at each side of the motors extending from one axle to the other, and beneath them, just inside the wheels. These should be suspended from lugs on the motor frame by suitable links as near the center line of each axle as possible. backs of the motors can then be carried on these bars by means of other lugs on the motor frame and springs above and below the lugs. This method of motor suspension is rapidly coming into general use and it has many advantages. If motors should be damaged it is simply necessary to place another pair of wheels and axles with other motors in the same truck frame. The motor cars ride much easier, or practically the same as before they were equipped with motors, due to the fact that the jarring of the motors is not transmitted to the car body.

The motor car must be wired for, and furnished with a suitable number of electric lights and heaters, which is a simple matter. The same thing must be done for the coaches it is proposed to haul. The latter should also be equipped with collecting shoes connected by a wire which terminates at each end in an electric coupler of sufficient capacity to supply the motors on the motor car if necessary. The motor car is supplied with the regular air brake apparatus used by the road and piped as a steam locomotive, except that the car is double ended and requires an engineer's valve, gauge and other necessary parts at each end.

The independent motor air compressor, main and auxiliary reservoirs, car wiring cables, main wires for collecting shoes, rheostats and electric couplers, all go under the car in addition to the standard equipment of a passenger coach.

A small cab should be provided at each end for the motorman preferably inside the car,

fitted with a front and side window which can be opened to their full extent. Here are located the air brake valves, the automatic governor and switch for the compressor, the motor controller, main switch, circuit breaker, electric light and heater switches. The bells or gongs, pilots and whistles at each end complete the list.

The total weight of a 60-foot standard coach equipped as a motor car with two motors will be about 80,000 pounds, without passengers, of which 55,000 pounds is on the drivers or motor truck. The speed of such a motor car running light, if geared sufficiently high, is probably only limited by its weight and the quality of its track and road bed. With a stone ballasted track, 100-pound steel rails, few curves, and those of long radius, a heavy car with the best steel tired wheels should run 100 miles per hour at full speed without difficulty.

I have mentioned a four-motor car consisting of a 60-foot car body weighing 100,000 pounds complete. This represents about 800 hp. nominal rating of the motors at 650 volts direct current, and this is the maximum hp. that can be placed under a standard coach, on trucks and wheels which do not necessitate any other changes in the existing standards of steam practice. The motors are capable of exerting double that power for a short time. The total cost of converting a standard coach into a motor car with two motors is about \$3,800.

The third method of using electric traction in steam service, that of the use of light motor cars and trailers, built for the purpose, has some advantages. The former coaches can be used elsewhere on the system as are the locomotives. The smaller, lighter cars are cheaper to construct, the wear on the track is less, and there is considerable economy in power. It has been proposed, and no doubt will come, that such cars will run through the the principal street of a city on the existing street car track, before starting on their trip over the steam track. This would necessitate either a trolley wire over the steam track, instead of a power rail, or both collecting shoes and trolley pole on the car. There is no question but that this may prove a great advantage in time. On the other hand, the cars must be used exclusively on the line equipped with electric power. At speeds of 50 to 60 miles per hour which must be made in order to compete successfully with the existing parallel trolley lines, the cost of maintenance and repairs due to the excessive vibration will undoubtedly be greater than that with standard coaches.

The economy in power due to the reduction in dead weight hauled is of considerable importance, not only on account of the smaller amount used, but the line conductors can be lighter, greatly reducing their cost, or the system can be extended to longer distances at no more expense for transmitting the power.

The fourth question, that of hauling freight by electric power, should, of course, be decided upon at the time of installation, as it may cause considerable difference in the plans for power stations and line transmission. As the question can only refer to local freight along the line electrically equipped, it is of doubtful importance as applied to the conditions under discussion. If the freight traffic on such lines be sufficiently heavy to necessitate the use of a locomotive for several hours daily during the hours between midnight and morning when there are few if any electric passenger trains in service, it is economy to use an electric loco-

motive, for it costs but little more to run the power station, if it has been shut down, and the total expense would be somewhat less than that of a steam locomotive. The whole question of transportation of freight by electric power is one which concerns the future more than the present.

When the time arrives that long distances are electrically equipped on our steam railways, then it becomes far more important.

POWER TRANSMISSION.

Feeders.—The transmission of electric power forms the most important part of the problem of the electrical equipment of a steam road. At the present day our railway motors all require the direct current, and we are therefore limited to its employment in the working conductor. By increasing its voltage from that usually employed to 700 volts, a considerable advantage is at once gained, and without additional expense in motors or generators. Experience has shown that the economical radius of operation of a power station generating such a current and delivered to the line without feeders is from 10 to 12 miles. This refers to a heavy train service with a fairly frequent schedule, and an average load of 500 amperes on each radial line of single track.

By the line or working positive conductor is here meant a steel rail of 90 to 100 pounds per yard, well bonded, and equal in conductivity to about 1,200,000 cm. of copper.

The Working Conductor.—In considering a train service consisting of heavy trains running at the speeds mentioned, the trolley wire as a working conductor will probably not come into general use, although it is used for such a service to-day. The cost of construction, maintenance and depreciation is greater than that of a third rail. It has few advantages, and many disadvantages for such a service. It is now generally conceded that an insulated rail placed close to the track answers all requirements, and the author's experience shows that it is satisfactory. It is difficult to understand, however, why the common form of T-rail is so generally used for this purpose unless it is due to a desire to save money by using up old rails, as a more inconvenient cross-section for thorough and efficient bonding could hardly be selected.

One question which has been studied with care is of great importance in this latitude, and that is the effect of ice on the contact surface, and how to get rid of it. Many experiments have been tried, and few can be said to have been successful. A further possible advantage of the use of some other form of pelled steel might result in the complete elimination of this trouble. I refer to the collecting shoes having a side or under-running contact. This would allow the partial roofing over the conductor by wood, which would thoroughly protect it from the weather.

Insulation.—The question of insulating the positive rail of a 700-volt grounded circuit has in actual practice been developed to such an extent that the results obtained are remarkable, to say the least. If such methods as are now in use had been proposed ten years ago, they would have been regarded as impracticable.

For years it was the custom to consider the ground a conductor of electricity. It was of course realized that the surface rails must be bonded in some way, but the ground was considered to be a great aid to the rails in returning the current. I do not propose to deny that this is true in a crowded city where there

are thousands of tons of iron pipes buried but a short distance beneath the rails, but can we call this a ground return? My experience shows that the road bed of a steam road consisting of sand, gravel or rock ballast, when dry, is a good insulator, and when wet there is but little difference. A rock-ballasted track in particular needs no insulation whatever except the wooden ties.

I am aware that such a statement may be regarded with doubt, but perhaps it can be made clearer if we take all things into consideration. The road runs through an open country, the soil is of the average composition, some of it wet, but most of it dry. If we stand on a wet spot and place our body in circuit from positive to ground we receive a shock, perhaps of maximum voltage. This would apparently show the ground to be a conductor, but a little thought will prove that it conducted a few milli-amperes only. If we stand in dry earth or on a tie, we feel no shock. But the one test that proves the insulation of such a line is the leakage test. From tests made every night, for over a year, the leakage average 1 ampere per mile in dry weather to 11 amperes in wet weather, and I am convinced that nearly all of this is in the underground work necessary at grade crossings and switch points. The above refers to a rail insulated upon creosoted wood blocks attached to the ties. A complete covering of snow, has little or no effect on the leakage. The form of the positive rail may influence the leakage somewhat. For example, the inverted V form acts as a roof to shed water and keeps the contact surface between the block and rail dry. But there is in use several miles of ordinary T-rail as a positive conductor, laid on blocks of wood 14" thick attached to the ties, not creosoted, but dipped in an insulating compound. No leakage is noticeable here. We can easily understand that if any appreciable amount of the current in amperes should leak through these blocks whether prepared or not, they would burn up. The writer, therefore, believes that such insulation of the positive rail for the current and voltage under discussion is ample, and much expense can be saved by steam roads by its use.

Track Bonding.—One of the most necessary and at the same time expensive parts of the work in changing existing steam roads into an electric line, is the bonding of the service rails. The author believes he has done some of the heaviest bonding in the country, and is of the opinion that there is no satisfactory method of bonding a T-rail at present. When such bonding costs two dollars per joint, it becomes a very serious matter. Bonding around the angle plate with the bonds about two feet long, is out of the question, for the cost of copper would be too great, and it would be exposed. Riveting the lugs on the bonds through the web of the rail, is not good practice, because to secure sufficient area of contact four holes would have to be drilled in the ends of each rail, which so weakens it as to render it unsafe. The shortest possible bonds should be used under the base of the rail. 1t requires four one-inch holes in the base of each rail, and we can easily see how unsatisfactory and expensive this is, with four bonds of 300,-000 cm. area for each joint of 100 pound steel. In nearly all rail bonds the principal resistance is in the contacts. It is a simple matter to use sufficient copper, but to secure a proper contact is a difficult problem. The bonds must have the utmost flexibility to withstand the

vertical motion of the rail ends, and even then many of them will gradually break off strand by strand. What is urgently needed at the present day is a cheap and efficient bond for a T-rail. Such a bond, to be satisfactory, must show no greater fall in potential than an equal length of the rail itself, when the maximum current is flowing through the joint. On account of the fact that the ground is practically of no value in augmenting the conductivity of the return circuit, the entire circuit must be regarded as metallic, and the ground should not enter into any calculations.

Power Stations.—The writer does not propose to enter into the subject of the design and arrangement of machinery in a power station for a steam road, as there are no engineering features which differ from those encountered in such a station intended for a large street railway. An abundance of water and cheap fuel are of course important points. Such power stations can be built for from \$80 to \$90 per kilowatt, exclusive of the land.

A few words about the amount of power required may be of interest. An important figure is the amount of power delivered at the switchboard per train mile. It eliminates all losses due to resistance of circuit, and current used for air compressors, electric lights and heaters. This figure will vary from four to six kilowatt hours per train mile, reaching its maximum in December and January, due to the longer hours of lighting the cars, the constant use of electric heaters, and the frequent running through snow.

The question of heating a standard coach by electricity is one that should be thoroughly understood. Street car heating is totally different. The public demands the same temperature as is furnished by steam, which is 68° or 70° F. It makes but little difference what heater is used, provided there are enough of them. One may radiate its heat faster than another, and so raise the temperature of the car more rapidly, but it will require, in any case. from 12 to 15 kilowatts of energy for each coach. An ordinary train, consisting of a motor car and two coaches weighing 200,000 pounds, will require, at a speed of 35 to 40 miles per hour on a level track, about 125 kilowatts, or about 166 hp., of which the car alone would consume 75 kw., if running light. The motor will consume an average energy of four to five kilowatt-hours per train mile, or 40 to 50 watt hours per ton mile. Power can be produced with condensing engines and fuel at about \$2.30 per ton, for about .008 (eight-tenths of a cent) per kw. hour.

.Cost of Operation,-It is most desirable in operating a heavy electric service over a railway on which steam trains are also operated, to arrive at a satisfactory conclusion as to the comparative cost of operating each type of train per mile. If an electric service is entirely substituted for one which has been operated by steam, the railroad company is in a position to know accurately the difference in cost of the two systems. But when both are operated over the same tracks the problem becomes very complex. For example, even if we omit the maintenance of the road way, which may be a little higher in an electric service. there are many other items, such as salaries of agents, ticket sellers, gatemen, etc., all of which properly belong to the operating department, which must be proportioned between the two services. It may be said that the cost of operating a steam passenger train has been estimated all the way from 30 cents to \$1,00

per mile depending upon the length of the train and other conditions, which are seldom alike in the different localities. The author cannot go into this subject in detail, but will give a few points of difference between the two services upon which an approximate estimate can be based. A fair average cost of running a steam locomotive, including fuel, when coal is about \$2.30 per ton, water, wages, repairs etc, is 22 cents per mile. The average cost of repairs to coaches may be taken at one cent per mile each. The wages of a train crew, consisting of a conductor, baggage master and one brakeman will average .05 per mile making a total of 30 cents. This figure is intended to represent the lowest possible cost of operating a train of only three cars by steam with the understanding that it is kept almost constantly moving for about 9 hours, and covering from 150 to 200 miles. It is well known that a train making but a few miles per day cannot be run at a profit, either by steam or electricity, due to the fact that cost of wages per mile increases rapidly, as the crew has to be paid the same in either case. A great advantage of the electric service may be mentioned here. The above service is all that can be required of one crew and one locomotive, but the motor car can easily make 300 to 400 miles in 18 hours, and as the daily service is in operation at least that long, one motor car does the work of two locomotives. In the operation of a similar three-car train in which one car is a motor car, we will assume the same crew with the addition of a motorman and omit the locomotive. The cost per mile in wages will then become 6½ cents, that of repairs to cars the same as before, 1 cent, maintenance of motors, ½ cent, and cost of power delivered to train, 6 cents, making the total cost per train mile, 14 cents for the electric service.

### NOVELTIES IN ACCUMULATORS FOR TRACTION PURPOSES.

Under the above title Herr Zacharias has an article in the first number of the "Centralblatt fur Accumulatoren und Elementenkunde,' dealing with the growth of the employment of accumulators for traction purposes. After referring to the early attempts which were made in 1884 by Julien in Brussels and Reckenzaun in London, to introduce accumulators for the propulsion of tram-cars, Herr Zacharias points out that the early failures prejudiced the tramway companies and others against the employment of accumulators, and so the manufacturers of the latter were forced to obtain the necessary experience by laying down short tram-lines at their own cost. The foremost firms in this field of work were the Aktiengesellschaft. Hagen, and the Wattaccumulatorenwerke, who about 1896 made extended trials in Berlin. But the cast-ribbed pattern of the Planté plate, first adopted by the Hagen Company, and the narrow mesh grid plate of the Watt Company were both found unsuitable, and have been since superseded. The cast-ribbed plates were not only heavy, but they were less durable than had been expected, chiefly because it was impossible to cast the plate thick enough to give strength and to be at the same time homogeneous. The "Watt" plate, on the other hand, lacked rigidity, and the carbon dust or carbonized filament diaphragm which was inserted between the plates interfered with the free circulation of the electrolyte, so

that the acid at the bottom of the cell became of much greater density than that at the top, with injurious results to the plates. Rolled lead has been substituted for the manufacture of Planté plates, but before this was introduced many other methods for making the plates more homogeneous had been tried. The plates had been forced between very finelygrooved rollers, so as to increase greatly the ribbed surface, or they had been pressed into moulds of various patterns which would give a large surface, but with no very satisfactory result, as such plates 'are always rather heavy. Dr. Majert was the first to manufacture Planté plates from sheets of rolled lead, employing a special form of plane. Another method of manufacturing positive plates of the Planté type is the "Monobloc," which is employed by the Aktiengesellschaft l'Electrique in Brussels. The positive plate in each cell is formed of a compact block consisting of about 120 sheets of lead, each 0.5 mm. thick, which are held together by a hard lead frame, and four corner pieces which are burnt on to the lead sheets. The plates are perforated according to their size, with from 20 to 30 holes 10 mm. apart. The negative plates are composed of quadrangular tubes 0.5 mm. thick, which are formed of lead hardened with a very little antimony. These tubes are filled with highly porous and spongy lead, and are provided with numerous longitudinal openings. This construction enables a battery having a large effective surface area to be enclosed within a very small space, and after more than a year's experience has been obtained of their working in various places, it has been found that they give satisfactory results; on the Belgian State lines it has been ascertained that the cells used for running the street cars only require cleaning after 20,000 kilometers had been run, so that the company is now in a position to guarantee the cost of running per kilometer. As the results of experience gained in working, the method of construction of the plates has undergone modifications and improvements.

In the Blot accumulator rolled lead is also employed for the positive plates, but in this case it is used in the form of long strips which are rolled up so as to fit into receptacles in the plate, but this system does not allow of much expansion and contraction taking place during charge and discharge.

The chief drawback to plates of the Planté type is no longer their weight, which has been largely reduced by the improved methods of construction, but consists in the time required for their formation. To hasten this, an electrolyte is usually employed which will attack the lead, such as some salt containing chlorine; but when the formation has been completed it is most important that the plate should be freed from every trace of chlorine, for practical experience has shown that it is most injurious, about 0.00004 per cent. being the largest amount permissible. This fact and the necessary tests and treatment of the plates are now generally understood, so that it is possible to avoid undue injury from the effects of chlorine.

The use of accumulators for traction purposes will be greatly extended in the future, when the cost of their maintenance has been decreased, which will be the case when the plates can be turned out in large quantities in factories by machinery, instead of being made by hand; and the factory in Brussels has already made a beginning in this direction.—The "Electrician," London.

### AN ELECTRIC CAR BRAKE.

A company of Cologne, Germany, has introduced a brake for electric cars, in which use is made of the Foucault, or eddy currents. When the car is running at the ordinary speed the electric brake is first applied to check the motion, but to bring the car to a standstill the mechanical brake is brought into use. This brake was first used on the electric tramways in Landsberg. As the cars there have one motor only, the second axle is appropriated to the brake, and the result appears to have been satisfactory,

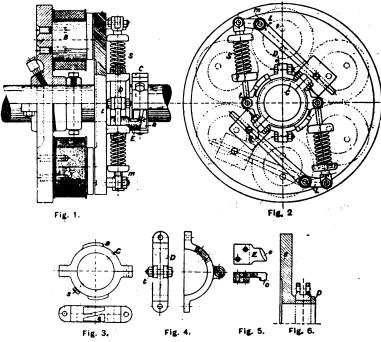

As long as the car runs at a high speed, the brake is actuated only by the Foucault currents, and the mechanical brake is brought into operation only when the speed has been so reduced that the force of the Foucault currents is no longer sufficient to apply the brake effectively, The electric brake thus does the beavy work of checking the rapid rotation of the axle, and as the mechanical brake is used only during relatively short intervals, the wear and tear on the brake shoes and wheel tires is very slight.

The brake is composed of two chief parts,

grooves of the ring C, so that the armature is driven along the axle. By aid of this arrangement the armature, as the speed of rotation decreases, approaches the brake magnets while increasing rapidity moves the armature in the opposite direction.

The effect obtained by mechanical action is increased by electro-magnetic current in the pole pieces of the armature, which acts during the decreasing rapidity in the same direction as the displacement. When the speed of the car increases the armature acts in the opposite direction

The brake magnets are excited by the motor, which acts as a generator. Both axles are braked, the one by the motor acting as a generator, the other by the aid of the Foucault currents engendered in the armature of the braking apparatus. When the brake is first applied, the tension produced by the motor acting as a generator is great, and the exciting current in the brake magnets is consequently relatively strong. As speed decreases, the exciting current becomes smaller; but at the same time as the armature is approaching the pole-pieces, the intermediate space of air between the armature and the

the electromagnets B and the iron armature A (Figs. 1 and 2), both parts being carried on the car axle. The electromagnets are strongly fastened to the frame of the truck, having no rotation. The winding of their fields F is such that the current passes through them. thus forming alternately the north and south pole. The armature is keyed upon the axle in such a way that, while it rotates, it may have at the same time a slight horizontal movement along the axle. Opposite to the center of the armature lies the ring D (Fig. 4), constructed of two pieces and can be rotated. Peculiar iron pieces E (Fig. 5) are fastened on its circumference. The ends of these pieces are rounded and slide through the inclined groove A of the ring C (Fig. 3). The ring C is secured upon the axle with a screw. The connection of the ring D with the weights Q is obtained by the aid of the lever mechanisms L (Fig1 and 2). The movable weights change their distance from the axle in accordance with the speed of the axle as the centrifugal force increases, and give a rotation to the ring D, by which the sliding pieces E change their position in the

\*From the "Tramway and Railway World," London.

magnets, and consequently the magnetic resistance diminishes, so that, in fact, the efficiency of the brake compared to the first effect obtained, has not diminished. As the speed is checked, the exciting current of the magnets and the produced Foucault currents are by reason of the slow movement very small, and the armature is pressed against the brake magnets. The mechanical brake then reinforces the Foucault currents and stops the car. The brake is enclosed in a sheet iron casing, and is thus protected against dirt and moisture.

### Berlin Electric Railways Cause Magnetic Disturbances.

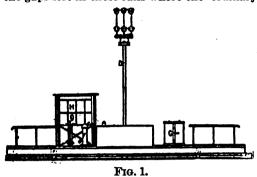

The technical institutions in Berlin, Germany, have laid a memorandum before the Reichstag respecting the electric and magnetic disturbances due to the electric tramways and railways in Berlin. In this memorandum it is pointed out that as soon as electric traction was first started on the circular railway the disturbances were felt in the Imperial Institute,  $2\frac{1}{4}$  miles away. This has necessitated special precautions being taken to prevent the instruments for measuring small currents from being affected.

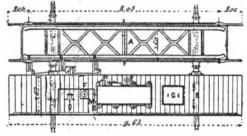

### AN ELECTRIC TRAVERSER FOR RAIL-WAY CARRIAGES.\*

### BY M. SABOURET.

In the Orleans Railway Station at Paris an electric traverser is used to carry railway carriages from one line of metals across on to adjoining rails, and the apparatus used is of particular interest because no trench is used for the same. The rails on which the traverser runs are practically level with the ordinary running rails, a system of duplicate bearing axles being used to get over the difficulty of the gaps left in these rails where the ordinary

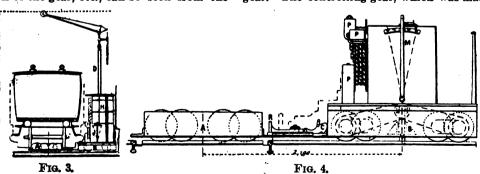

running rails are crossed. In the illustrations herewith, for which we are indebted to the Revue General des Chemins de Fer, drawings of the arrangement of the traverser carriages are shown, from which it will be seen that there are two distinct trucks, one of which takes the railway carriage, while the other is

F1G. 2.

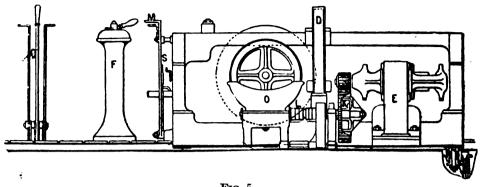

provided with the electrical arrangements for moving the same. The motor truck only differs from the carrying truck in slight details. Of course, it could be kept much shorter, but it is convenient to use the same traversing rails, and hence it is made practically of the same dimensions. This truck is also fitted with a hauling arrangement, by which the carriages can be drawn on to the transporter truck. The details of the gear, etc., can be seen from the

illustrations. Thus Fig. 1 shows the general view of the truck with collecting gear, while Fig. 2 is a cross-section of the same. Fig. 3 is a plan of the apparatus showing the two trucks coupled together, Fig. 4 is an end elevation showing the driving gear, and also one view of the hauling rope. Fig. 5 is a front elevation of the driving gear, showing the way in which

the motor is mounted, which can also be further seen in the plan (Fig. 6). Three trolley wires are used to take the current to the motor, because in this railway station electricity is distributed on the continuous-current system at 375 volts with 125 volts between each pair of wires. We gather from the description that two of the trolley wires supply the armature at 375 volts. The remaining wire is used for ex-

consumption of energy was found to be required; first when the traverser was working without load, and next when it was loaded with 13 tons. In starting it took from 8 kw. to 9 kw. light, and 12 kw. to 15 kw. when loaded. At a small speed of about one yard per second the kilowatts varied from 2.5 to 3.7 with the traverser light, and from 3.7 kw. to 5.2 kw. when it was loaded. At higher speeds up to about

F1G. 5.

citation purposes, there being 125 volts between it and one of the first pair. The rails are not used at all for conducting the current.

The arrangement of the reducing gear between the motor and the axle can be readily seen in the drawings, as also the arrangement of clutches for throwing the hauling rope in 11 yards per second only a slight increase in the consumption of energy was observed, varying from 3.7 kw. to 4.5 kw. when the traverser was running light, and from 6.4 kw. to 8.2 kw. when the traverser was loaded. It seems that the apparatus is doing good service at the above railway station, as no less than 250 to 350

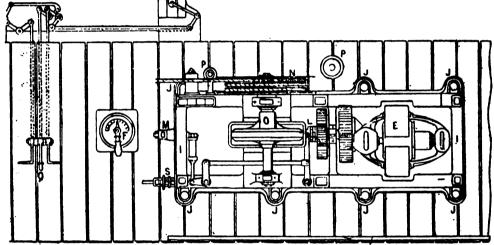

Fig. 6.

and out of action, and for connecting and disconnecting the driving power to the axles. Chains are used to transmit the motion to the two axles of the truck, and these axles are also geared to the other two by means of chain gear. The controlling gear, which was manu-

factured by the firm of Sautter-Harlé, provides for five different speeds. The first of these corresponds to a connection of all the resistances in circuit; the second and third steps are obtained by successively cutting out resistances; the fourth step reduces the series excitation of the magnet, while in the fifth step a resistance is inserted in the shunt circuit. From trials made on the railway the following

vehicles are transported during 24 hours. It is used particularly in connection with post office service, for the mail trains which are made up at this station. In this case the hauling gear is almost as often needed as the traverser, but owing to the limited time it is found advantageous to move the trucks to the traverser by horses. The cost of the whole, including the necessary rails for crossing 20 sets of metals, the truck for transporting the carriages, the motor truck, and all the electrical apparatus, came out at £1,800.

ACCORDING to the Cleveland (O.) "Leader" a Massachusetts genius has succeeded in attaining results that, so far as sheet metal work is concerned, are almost equal to what he would be able to accomplish if he had rediscovered the secret of tempering copper. The inventor has made sheets of seemingly pure copper of wonderful thinness and with the springiness, strength and capacity for being tempered that steel has. Many thousands of dollars have been spent on the experiments, and the few sheets of the new material that have been made cost a great deal more than their weight in gold. The process consists in rolling a hot steel plate and two heated copper plates at the

<sup>\*</sup>From the "Electrical Engineer," London.

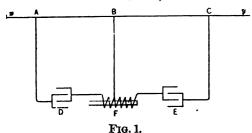

same time in such a way that the copper forms a skin over the surfaces of the steel and gives it all the weather resistance that pure copper has, that it will not rust, and has at the same time the strength of steel, is the claim made. It can be stamped as well as tin, and crimped or otherwise worked in ways and under circumstances that would be impossible with sheets of copper.

### A FARADMETER.\*'

### BY M. I. PUPIN.

The art of measuring the capacity of a condenser has not yet reached that stage of perfection which can be justly claimed for the resistance measurement. The prevailing method is the ballistic galvanometer method. Leakage and absorption can and often do introduce serious errors into this method. These errors can be reduced to any desirable limit by employing alternating currents of appropriate frequency.

This was the principal consideration which led to the construction of the faradmeter which forms the subject of this note. In addition to this consideration, which concerns

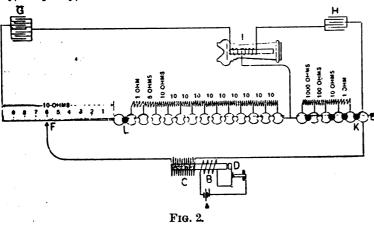

the accuracy, there is another very important consideration which must be taken into account and that is the convenience of the method and the cheapness and durability of the apparatus to be employed. Much of the capacity measurement work, especially in connection with telegraphy, telephony, and the construc-

tained in the telephone. Then capacity of D: capacity of E:: resistance of BC: resistance of AB. It is understood, of course, that the resistances AB and BC are non-self-inductive and that the capacity reactance of each condenser is in its own circuit by far the greatest element of the impedance. It will be seen presently that these conditions are fulfilled in the apparatus shown in Fig. 2, which our fellow member, the well-known mechanician, Mr. Baillard, constructed for me and employed in some work which he has been doing for me during the last two months.

In Fig. 2, A is a cell which feeds into the primary B of a small induction coil provided with an interrupter such as is used in electrotherapy. The secondary c is connected to a row of resistance coils E and L. These resistances are arranged in convenient steps as indicated. The resistance coils L have in addition several equal lengths of manganin wire F stretched over a graduated scale. The resistance of the coils as well as of the manganin wire is carefuly calibrated once for all. The condenser H is a carefully constructed mica condenser of known capacity. G is the condenser the capacity of which is to be determined. I is the differentially wound telephone. The approximate adjustment is accomplished by the plugs which control the resistances E and L, and the final adjustment is made by the manganin wire by a sliding contact F which varies the length of the manganin wire to be introduced, and therefore varies the drop which acts on one of the condensers. With ordinary frequencies capacities up to several microfarads can be determined with an accuracy of a small fraction of one per cent, easily and rapidly.

It is self-evident, of course, that in place of the differentially wound telephone I, we can use an ordinary telephone and place it in the bridge which connects a point between G and H to a point between the resistance coils E and L. The conditions of balance are the same as

tion of alternating current machinery, has to be done under conditions under which it is quite inconvenient to employ the ballistic galvanometer. I believe that the faradmeter described here will be found to answer quite satisfactorily all reasonable requirements as regards convenience.

The theory on which the construction of this meter is based is very simple, as follows: Let xy (Fig. 1) be a conductor through which an alternating current flows. D is a condenser of known capacity and E is a condenser of unknown capacity; F is a differentially wound telephone. Connect as indicated and adjust the resistances A B and B C until silence is ob-

\*Paper presented at the 140th Meeting of the American Institute of Electrical Engineers, New York, February 28, 1900. in the method employing the differentially wound telephone. In many practical cases this second method is preferable.

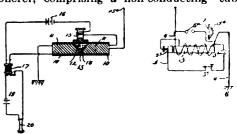

### Susceptibility of Trees to Lightning.

The overseers of nine forestry stations in the dukedom of Lippe, in Germany, have made an examination of trees struck by lightning throughout an area of 45,000 acres, in order to ascertain for the German Government the susceptibility of various trees to lightning and its effects and occurrence in general. As a result of their observations, says the Philadelphia "Manufacturer," it was found the oak tree was by far the most liable to lightning, in spite of the fact that they were not as frequent as other trees in the forest. The percentages of the various species were given as follows:

Beech, 70 per cent.; oak, 11; pines, 13, and firs, 6. During the several years through which these observations were made, 275 trees were struck by lightning, and of these 159 or 58 per cent. were oaks, 59 or 21 per cent. firs, 21 or 8 per cent. beeches, and 20 or 7 per cent. pines, the other varieties damaged being still less in number.

### A Wireless Telegraphy Patent.

On February 27 a patent was issued to Archie F. Collins of Saratoga Springs, N. Y., on a wireless telegraphy receiver which embodies several new features and is herewith shown. What the inventor claims is "a receiving apparatus for wireless telegraphy consisting of a coherer, comprising a non-conducting tube,

aligned conductor-plugs arranged within the tube and having their separated inner ends beveled to form a V-shaped pocket, which is adapted to receive comminuted magnetic particles, a conductor-strip of high electrical resistance bridging the inner ends of said plugs, a local circuit embracing said plugs, and magnetic particles, a relay and a magnet in said circuit, the latter being arranged to act on said magnetic particles, substantially as and for the purpose set forth."

### SOCIETY NEWS.

### The New York Electrical Society.

The 203d meeting of the New York Electrical Society took place Friday evening, March 2, at the College of the City of New York. A most interesting lecture was delivered by Dr. A. R. Ledoux on "Copper from the Ore to the Wire Bar," during which a number of copper specimens were exhibited. The attendance was quite large.

### American Institute of Electrical Engineers.

The 140th meeting of the Institute, was held at 12 West 31st street, New York City, on Wednesday last.

A note on "A Faradmeter" was presented by Dr. M. I. Pupin, and the instrument described and explained by the author was exhibited by him. Messrs. Hering, Wolcott, Bradley and Reed took part in the discussion.

A paper was presented by Edward C. Boynton, of New Haven, entitled "Notes on Electric Traction Under Steam Railway Conditions." The discussion was opened by Mr. F. J. Sprague and continued by Messrs. Hutchinson, Hanchett, Lamb, Ries, Pope, Holbrow, Mailloux, Atwood and Emerson.

At the meeting of the Executive Committee in the afternoon the following associate members were elected:

Henry Howell Barnes, John Duncan Boyd, Clement W. Evans, Lewis Warner Henry, A. M. Hunt, Wm. G. Lawrence, J. L. McaCreary, H. D. McVay, Morris M. Neurath Frans Oscar Renstrom, Mariano L. Schiaffino, Walter Eugene Smith, George Lourie Wiley, J. M. Zapata.

Mr. Edward J. Willis, of Richmond, was transferred to membership.

It was voted by the Executive Committee

that the Annual Business Meeting should be held in New York City on May 15, the date fixed by the constitution, at which the ballots for new officers will be canvassed. On the afternoon of the following day, May 16, the General Meeting for the reading and discussion of professional papers will open at Philadelphia, continuing possibly for three days.

### LEGAL NOTES.

Colorado Springs lately won an important victory in the United States Circuit Court. The suit filed by the Pike's Peak Power Company against the city of Colorado Springs was dismissed by Judge Hallett, who declared the ordinance giving the company a lease on the water system of the city, to generate power and electricity, was void as it was granted by the council without the necessary two-thirds vote of the people.

Judge Perkins rendered a decision in the Circuit Court a short time ago by which Joplin. Mo., was decreed the right to furnish commercial lighting from its municipal plant, which it recently completed. The decision was founded on the grounds that the city of Joplin being a corporation and the petitioners for an injunction being a corporation, that one was authorized as much at the other to compete in this line of business.

### Another Souvenir from the American Electrical Works.

The American Electrical Works of Providence, R. I., which never fails to suitably commemorate the leading holidays and events of the year, has forwarded to us a handsomely gotten up steel engraving of Martha Washington with the gateway of Mt. Vernon dimly outlined in the background, and accompanied by a tastefully printed card which says:

The wives of great men have rarely been prominent figures in and of themselves. They have found their greatest happiness in exercising the peculiarly feminine and wifely qualities, and by their quiet encouragement and sympathy aiding perhaps more than the world realizes, in the pronounced success of their husbands. Such was

### MARTHA WASHINGTON,

the subject of the steel portrait we send you on this Anni versary of the birth of Gen. George Washington.

Martha Washington, wife of George Washington, was born in New Kent County, Virginia, May, 1732, daughter of Col. John Dandridge. In June, 1749, she married Daniel Parke Custis, who died in 1757, leaving her a wealthy widow with two children. She was married to Washington in January, 1759, and died at Mount Vernon, Virginia, May 22, 1802, two years and five months after the death of her illustrious husband.

Beautiful, domestic, loyal, devoted, she was a representative of the best type of American women.

### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended February 24:

Amsterdam, 225 cases, \$11,825; Antwerp. 27 cases, \$15,845; Argentine Republic, 111 cases, \$7,804; Belfast, 2 cases, \$384; Berlin, 1 case, \$10; Brazil, 83 cases, \$3,028; Bremen, 2 cases, \$20; British East Indies, 4 cases, \$192; British Possessions in Africa, 12 cases \$649; British West Indies, 20 cases, \$607; Central America, 30 cases, \$1,248; Chili, 9 cases, \$76; U.S. Colombia, 8 cases, \$244; Dutch East Indies, 1 case, \$70; Havre, 351 cases, \$47,616; Japan, 15 cases, \$639; Liverpool, 170 cases, \$10,017; London, 338 cases, \$14,-167; Marseilles, 85 cases, \$7,125; New Zealand, 12 cases, \$302; Peru, 135 cases, \$638; Porto Rico, 25 cases, \$547; Riga, 3 cases, \$567; Southampton, 62 cases, \$1,024; Urguay, 1 case, \$5.

The following were the exports during the week ending March 3:

Alexandria, 1 case, \$48; Argentine Republic, 390 packages, \$28,325; Brazil, 43 cases, \$1,743; Bremen, 1 case, \$42; British East Indies, 83 cases, \$11, 384; British Possessions in Africa, 5 cases, \$313; Brussels, 1 case, \$71; Chili, 5 cases, \$239; Cuba, 29 cases, \$859; Ecuador, 3 cases, \$14; Hamburg, 92 cases, \$2,253; Havre, 339 cases, \$11,582; Hull, 42 cases, \$160; Liverpool, 224 cases, \$10,157; London, 58 cases, \$2,099; Manchester, 13 cases, \$3,900; Nova Scotia, 2 cases, \$48; Odessa, 5 cases, \$525; Peru, 104 cases, \$1,849; Stettin, 64 cases, \$13,241; St. Helens 191 cases, \$2,500; U. S. Colombia, 35 cases, \$541; Venezuela, 52 cases, \$109.

### PERSONAL MENTION.

Dr. James L. Weston, secretary of the Automatic Electric Car Lighting Company of New York, died at his home in Brooklyn a short time ago.

Mr. Astley C. Terry has been appointed electrician of the fifth eastern district of the Western Union Telegraph Company. All electrical work in that district will hereafter be done under his supervision. The district has about 40,000miles of wire in New York, Pennsylvania and Canada, and

Mr. Gunsanback of New York, who was formerly in the employ of the Westinghouse Company, has accepted a position with the Wetmore Electric Company at Lowville, N. Y.

Mr. W. L. Pierce, formerly superintendent of the Traction Air & Electric Company at Cortland, N. Y., has accepted the management of an electric lighting plant in another city.

Mr. W. W. Gurley was lately elected general counsel of the Chicago Union Traction Company. Mr. Gurley now succeeds to the title as well as to the position formerly held by Henry Crawford, who was temporary counsel for the Whitney interests in carrying out the deal with Mr. Yerkes.

Mr. Charles Tomlinson Rittenhouse of New York City, well known as an electrical expert, died of pneumonia last week in Denver, Col., where he nad gone for his health. He graduated with honors from the electrical department of Columbia University. When Dr. Pupin of Columbia was experimenting with the X rays in 1895, Mr. Rittenhouse conducted many of the experiments and took some of the first X ray pictures in the State. He was a member of the New York Electrical Society, the American Institute of Electrical Engineers, and an alumnus of Stevens Institute and Columbia University.

### INCORPORATIONS.

The Delaware Electric Light & Heat Company, Wilmington, Del. Capital stock, \$200,000, with power to increase to \$3,000,000. Incorporators: Joseph Swift, Henry F. Dure. Edgar M. Hoopes, Henry C. Robinson, Elwood Pyle and others.

The Boston Electric Heating & Power Company, Portland, Me .- to manufacture and deal in all kinds of electric heaters, motors and dynamos. Officers: president, W. G. Webber, of Bedford, Mass; treasurer, L. E. Russell, of Farmingham, Mass.

The St. Lawrence International Electric Company of Alexandria Bay and Clayton, N. Y. Capital stock, \$20,000, Directors: F. L. Hall, of Clayton, and W. E. Miller, Win. W. Avery, J. S. Keeler, William Leyare, A. A. Leyare and N. A. Haughton, of Alexandria Bay.

The Indianapolis Power Plant Company, Indianapolis, Ind. Capital stock, \$300,000. The Central Trust Company is the concern's financial agent.

The United Gas & Electric Company, Syracuse, N. Y.—to manufacture gas and electricity. Capital stock, \$4,000,000. Directors: L. Bedell Grant and John T. Kirk, of Brooklyn, and Ashley T. Cole, of New York City. The company takes over the business of the present Syracuse Electric Light and Syracuse Gas Companies, and its operations will extend throughout Onondaga County.

The Ohio River Electric Railway & Power Company, Racine, O .- to operate a railway between Middleport and Racine. Capital stock, \$300,000.

The Kanawha Traction & Electric Company, Montgomery W. Va.-to build and operate an electric railroad. Capital stock, \$100,000. Incorporators: G. W. Champ, E. W. McCormick, M. J. Simms, B. H. Early, all of Montgomery; C. W. Dillon, of Fayetteville.

### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR 4. MICHEL. Nos. 302-304 Broadway, New York City. N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon payment of ten cents. When ordering give name, date and title of invention wanted.

### LETTERS PATENT ISSUED FEBRUARY 27, 1900.

### ELECTRIC RAILWAYS AND APPLIANCES.

644,094. Electrical Bond for Railroad-Rails. James M. Price, Philadelphia, Pa.; Walter F. Price and William L. Price executors of said James M. Price, deceased. Filed April 23, 1894. Renewed Jan. 16, 1990.
644,108. Contact Device for Conduit Electric Railways Carl F. P. Stendebach, Leipsic, Germany, assignor to Electricitats Gesellschaft Reitz & Co., mit Beschrankter Haftung, same place. Filed Sept. 28, 1899.

### ELECTRIC LIGHTS AND APPLIANCES.

644,160. Electric Glow-Lamp. Wilhelm Boehm, Berlin, Germany. Filed Feb. 2, 1899.
644,408. Car Lighting System. John L. Creveling, New York City. Filed Oct. 28, 1899.

### ELECTRICAL MACHINERY AND APPARATUS.

644,051. Controller for Alternating-Current Circuits. Ernst J. Berg Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 11, 1829. 644,072. Automatic Gravity Cut-out for Electrical Circuits. William Hanlon, Poughkeepsie, N. Y. Filed June 20, 1869.

644,672 Automatic Grivity Cutout for Lifective at Circuits William Hanlon, Poughkeepsie, N. Y. Filed June 20, 1889.
644,251. Electric-Contact Apparatus, Carl G. O. H. von Kohler, Stockholm, Sweden, assignor to the Patentaktebolaget Svea, same place. Filed Dec. 5, 1898.
644,352. Electrical Measuring Instrument. James W. Packard, Warren, Ohio. Filed Jan. 12, 1900.
644,357. Multiple-Fuse Cut-Out. James B. Hubbard and Charles J. Dorsey, Baltimore, Md., assignors of one-third to Harry T. Mudd, same place. Filed Oct. 28, 1899.
644,484. Circuit-Closer for Telegraph-Keys. Elmer E. Nye and Louis C. McIntosh, Los Angeles, Cal. Filed Oct. 28, 1899.
644,517. Resistance-Switch for Electric Circuits. John H. Holmes and Frank Broadbent, Newcastle-upon-Tyne, England. Filed Dec. 18, 1899.
644,552. Electric Meter. George Hookham, Birmingham, England. Filed Sept. 12, 1899.
644,553. Apparatus for Converting Alternating into Continuous Currents, and Vice Versa. Maurice Hutin and Maurice Leblanc, Paris, France. Filed June 19, 1899.

### TELEPHONES AND TELEPHONE APPARATUS.

TELEPHONES AND TELEPHONE APPARATUS.
644,294. Switch-Box for Intercommunicating Telephone Systems. Albert K. Keller, Philadelphia, Pa., assignor to George F. Payne, same place. Filed July 1, 1897.
644,295. Telephone-Transmitter. Albert K. Keller, Philadelphia, Pa. Filed Aug. 20, 1898.
644,206. Telephone-Receiver. Albert K. Keller, Philadelphia, Pa. Filed Aug. 27, 1898.
644,315. Telephonic Relay. Fred H. Brown, Oak Park, Ill. Filed Nov. 27, 1899.
644,547. Telephone-Transmitter. Ernest B. Fahnestock, Washington, D. C., assignor to the Fahnestock Transmitter Company, New York City. Filed Jan. 15, 1897. Renewed Aug. 5, 1899.

### MISCELLANEOUS.

MISCELLANEOUS.
644,050. Manufacture of Lead Peroxid and its Application to Electrical Storage Batteries. Hermann Beckmann, Witten, Germany. Filed Dec. 9, 1899.
644,128. Automatic Controller for Electric Compressors. Niels A. Christensen, Milwaukee, Wis. Filed Sept. 2, 1899.
644,143. Electric Gas-Lighting Candle-Burner. Ray N. Noyes, Haverhill, Mass., assignor to the Electric Gas Lighting Company, Boston, Mass. Filed April 10, 1899. Renewed Jan. 2, 1900.
644,144. Connecting-Plate for Storage Batteries. Harry G. Osburn, Chicago, Ill., assignor to J. Herbert Ballantine, Newark, N. J. Filed Feb 17, 1849.
644,278. Means for Regulating Electric Machines. William H. Cooley, Brockport, N. Y. Filed March 9, 1849.
644,311. Method of Winding Helices for Electrical Purposes, James C. Anderson, Jersey City, N. J. Filed June 15, 1899.

544,311. Method of Winding Helices for Lectrical Purposes, James C. Anderson, Jersey City, N. J. Filed June 15, 1899.
644,312. Electrical Helix. James C. Anderson, Jersey City, N. J. Filed Aug. 29, 1899.
644,407. Automatic Regulation of Systems of Electrical Distribution. John L. Creveling, New York City. Filed Ogt. 24, 1899.
644,409. Electrical Distribution. John L. Creveling, New York City. Filed Oct. 28, 1989.
644,433. Signal Apparatus for Boilers. William B. Lowe, Jr. Atlanta. Ga. Filed Dec. 2, 1898.
644,497. Wireless Telegraphy. Archie F. Collins, Saratoca Springs, N. Y., assignor, by direct and mesne assignment to the American Wireless Telephone and Telegraph Company of Arizona Territory. Filed Nov. 7, 1899.
644,510. Process of Electrical Reduction. Ellis F. Frost, Washington, D. C., assignor of one-half to Frederick A. Lehmann, same place. Filed Nov. 21, 1899.
644,538. Voltaic Cell. Albert Pfannenberg, Berlin, Germany. Filed April 15, 1899.
644,551. Electric Signaling Apparatus. Geo. Harris, Detroit, Mich. Filed Aug. 6, 1898.
644,552. Process of Reducing Apparatus Inductance of Electrical Circuits. Maurice Hutin and Maurice Leblanc, Paris, France. Original application filed June 19, 1899.
Divided and this application filed Dec. 26, 1899.

### GENERAL NEWS.

What is Going On in the Electrical World.

### LIGHTING.

Albany, N. Y.—A proposition is now before the common council to bond this city for \$250,000 for the purpose of establishing a municipal electric light plant.

Atlanta, Ga.—W. C. Rawson, of the Elizabeth Cotton Mills in this city, wants an estimate on an electric light plant.

Anburn, Neb.—R. B. Stichler has offered to put in an electric light plant here at a cost of \$15,000.

Bellville, Ill,-At a recent meeting of the council committee on lighting was authorized to advertise bids for the construction of a municipal electric light plant.

Blaine, Wash.—The Blaine Electric Light Company's plant was burned lately.

Blissfield, Mich.—The council has submitted to the electors of the village the question of raising \$3.500 to be used for the completion of the electric light plant.

Chicago, Ill.—Mandel Brothers have purchased the Wendell Manufacturing Company's plant on Armour avenue, near 22d street. An electric light plant will be installed at once.

Clayton, Del.—The residents of this place are considcisyton, Dat.—I he residents of this place are considering the practicability of establishing an electric and waterworks system for this town.

Clinton, Ill.-E. S. Nixon has been granted a franchise for erecting and conducting an electric light plant

Collinwood, O.—Bids will be received until March 12 for furnishing all work and material necessary for the construction of an electric light plant for this vil-Address L. A. Wilson, clerk.

Coquille, Ore.—An electric light plant will soon be

Dickson, Tenn.—The city council is considering a proposition from a private company for the erection of an electric light plant here.

Elbow Lake, Minv.—The citizens have voted to bond the village for \$7,500 to put in an electric light plant, to be owned and operated by the village.

Ellisville, Miss.—This town is discussing the question of erecting an electric light plant.

Ft. Wayne, Ind.—Several residents of the south side have been talking about establishing a private electric plant for lighting their homes.

Grav's Lake, Ill.-C. Wollie is preparing to erect an e ectric light plant here

Hanover, O.—A petition was submitted recently, asking the council to grant a vote at the coming spring election, that the town be bonded for an electric light

Houston, Tex.—Plans will soon be prepared for the new 500 are and 6,000 incandescent electric light plant. Address City Engineer Potter.

Iela, Kan.—This town contemplates the erection of an electric light plant.

Ishpeming, Mich.—A proposition to install a munici-pal lighting plant will be submitted to the voters of this city at the spring election.

Libertyville, Ill.—The Libertyville electric light plant was burned last week, and is a total loss. It will be rebuilt at once. A. L. Burge is the manager.

Louisville, Ky.—The general council contemplates the establishment of its own electric lighting plant in

Mansfield, Tex.-Mansfield is to have electric lights scon.

McMinnville, Ore.—Many citizens have offered to furnish the money for the purchase of a new electric light plant.

Monroe, N. Y.—Mr. Day, proprietor of a mica mill, expects to put electricity in the mill in the near future. He proposes to generate enough to supply the village or to any others who may wish to light their s with it.

Morehead, Ky.—A company has been formed, headed by Wm. Rice, formerly of this place, for the purpose of establishing a waterworks system and an electric light plant.

New Cambria, Mo--There is a movement on foot for an electric light plant to light this city.

Palestine, Tex.-St. Louis capitalists are figuring on tting in a large electric lighting and power plant in this place.

Red Oak, Is.—A franchelectric light plant here. -A franchise has been granted for an

Richmond, Va.-The city engineer, W. E Cutshaw, wants estimates on a plant of 500 lights, wiring and boiler already in position. An engine, dynamo, steam, supply and exhaust pipes and proper connections with witch boards are also required.

Scotland, S. D.—The authorities have decided to light this town with electricity, and steps are now being taken for the establishment of a lighting plant.

Shippensburg, Pa.—Messrs. Shryock Brothers have sold to John Hosfield, of this place, the mill site and

water power at Middle Spring. Mr. Hosfield intends to put the waterway in repair and will establish an electric plant, and conduct the current to Shippens-burg for running machinery and perhaps electric lighting.

Sorento, Ill.—The citizens of this village are talking f establishing an electric light plant in the near future.

Stephen, Minn —The citizens of this place are talking of building a municipal electric lighting plant.

ing of building a municipal electric lighting plant.

Tallahassee, Fla — The city council is considering bids for the building of a new electric light plant.

Washington, D. C.—Col. Theodore A. Bingham, in charge of public buildings and grounds in the District, has recommended to the Secretary of War that Congress be asked to appropriate \$26,500 for an electrical plant for the Washington Monument.

Waverly, Neb.-The citizens of this place are considering the proposition of an electric light plant to be owned by the town.

White Oake, N. M.—A stock company has been formed to establish an electric plant at this place.

Youngstown, O.—The Merchants' Heat, Light & Power Company recently incorporated, contemplates extensive improvements on their plant in the near future.

### STREET RAILWAYS.

Asheville, N. C.—The Montford Electric Car Line, of this city, has been bought by E. B. Bliss & Co., capitalists of Chicago and Kentucky. The line will be extended at once by the shortest route to Weaversville, a distance of eight miles.

Castile, N. Y.—The citizens of this place are interested in the proposed electric railroad between this place, Silver Springs, Pike and Perry.

Cleburne, Tex.—A committee was sent to Fort Worth recently to meet some Cleveland, O., capitalists in regard to building their proposed electric road from Dallas to Fort Worth on to this place. Messrs. Coffinbury and Bishop will confer with Cleburne people further about this line.

Columbus, O.—The Columbus Freight & Traction Company, recently incorporated by W. D. Brickell, W. D. Park and W. D. Hamilton will construct an electric street railway in this city.

Ft. Worth, Tex.—The city council has granted a franchise to Messrs. Bishop and J. D. Coffinbury of Cleveland, O., to build the proposed electric line in this city in connection with the road betweed Ft. Worth and Dallas. The estimated cost will be \$700,000.

Galion, O.—A preject is said to be under way to construct an electric railway from here through to Mt. Vernon, making when complete a through line.

Gardiner, Me.—The question of building an electric road will be presented to the voters of this place at the March election, and the hearing before the railroad commissioners will be held the latter part of the month.

Louisville, Ky.-The Louisville Railway Company has decided to make a number of improvements to its present electric line and will expend about \$200,000 during the year. T. J. Minary is president of the

Manchester, Va.—The Virginia Railway & Develop-ment Company has decided to build an extension of its electric line from Richmond here.

New York.—It is now claimed that former Governor Morton, John D. Rockefeller and J. Pierpont Morgan of this city are anxious to construct an electric railway in opposition to the Central Hudson road. It is claimed that such a company has already been formed. The plan is to gradually construct a line, beginning at this city, until Albany is reached.

Onancock, Va.—It is now certain that Onancock will have an electric car line which will connect this town with Accomac Courthouse, crossing the railroad at Tasley station.

at Tasley station.

Philadelphia, Pa,—The journey from this city to New York by trolley is in sight. This is the opinion of both lawyers and railroad men, in view of the opinion just handed down by the Supreme Court, ordering back to the Buck's County Court for a rehearing the question in dispute between the Philadelphia & Bristol Railway Company and the Pennsylvania Railroad.

Plain City, O.—There is some talk of organizing a stock company to build an electric road from this city to Mt. Sterling via London, providing arrangements can be made with the proposed Columbus, London and Springfield line to secure power.

Sycamore, III.—Application has been made for the incorporation of the Geneva Lake, Sycamore and Morris Electric Railroad Company with its principal office here. The line is to extend from Morris, III., to Geneva Lake, Wis., with branches to De Kalb and Belvidere. The capital stock will be \$150,000.

Syracuse, N. Y.—The Syracuse & Oneida Electric Railway Company has secured franchises from every town through which the proposed electric street railway is to be built and work will be commenced as soon as possible. W. B. Kirk, T. W. Meacham E. F. Allen and others are directors.

Winslow, Me.—A good deal of interest is shown in the matter of a proposed electric road from here to North Vassalboro.

### MANUFACTURING, ETC.

Pittsfield, Mass.—At a recent meeting of the Stanley Electric Manufacturing Company, the final legal transfer of the property of the company to F. W. Robeling, of Trenton, N. J., was made. The company was reorganized and has been capitalized at \$2,000,000 under the laws of New Jersey. It is reported that the Stanley Electric Manufacturing Company will erect six new mills, at a cost of \$500,000.

Ravenna, O.—It is reported that the Orient Electrical Company, manufacturers of incandescent lamps and other goods in that line located in Youngstown, O, will remove here this spring.

Trenton, N. J.—The Berlin Manufacturing Company was recently incorporated with a capital stock of \$200,000, to manufacture railroad cars, steel cars, trucks, wheels etc. This company controls the Haan patents for freight cars and other devices. It will build a factory in New Jersey.

### COMPANY MATTERS.

Chicago, Ill.—The Hartley Electrical Company was one of the firms occupying the brick building at 51 to 55 Jefferson street, that suffered loss by the recent fire.

Monrovia, Cal.—The Monrovia Electrical Power Company has been merged into the newly incorporated United Electric, Gas & Power Company which has also purchased the interests of the Santa Monica, Long Beach and San Pedro plants. The company proposes to put into Monrovia a first-class electric plant.

Newburg, N. Y.—The Consolidated Gas, Electric Light & Power Company of this place has increased its capital stock and bonds with the intention of purchasing the plant of the Consumers' Gas Company.

Washington, D. C.—A bill has been lately introduced by Representative Corliss which grants to the Michigan & Lake Superior Power Company of Sault S. Marie, the right to use water for its canal from St. Mary's River, on condition that the height of the water in the river is maintained.

water in the river is maintained.

Waynesboro, Pa.—D. M. Good, Jr., president of the Geiser Manufacturing Company of this place, large maunfacturers of separators, traction engines, etc., recently made a contract with H. G. Nergararian & Bro. for the largest single order of their machinery ever purchased for export to the Orient. The value of the deal could not be ascertained, but Mr. Nergararian admitted that the ocean freight bill alone would amount to considerably over \$6,000.

Winning Man.—The Brandon Electric Light Com-

Winnipeg, Man.—The Brandon Electric Light Com-pany intends incressing its capital stock to \$125,000, and apply to the Legislature for power to build a dam on the Little Saskatchewan River to supply power for running electric street cars and a telephone system.

### POWER AND TRANSMISSION PLANTS,

Ceresco, Mich.—The Kalamazoo Valley Power Company, which has the immense dam and power at Allegan, has decided to build a second plant at this place on the Kalamazoo River. The company bought this water power several years ago, with a view of doubling its capacity. This new dam will give enough electrical power to supply all southern Michigan, in fact more than can possibly be used.

Easton, Pa.—The Lehigh Power Company has purchased a two-acre tract of land near Raubville, on which it is proposed to erect a large plant along the Delaware Canal for generating electricity. The plant is to be operated by water power.

### AUTOMOBILES.

Amesbury, Mass.—A representative of a New York automobile company recently placed with local carriage manufacturers probably the largest order received here in many years. The New York firm has contracted for the delivery of from twenty to thirty finished automobile bodies per day for six months, and as the cost of these bodies will be from \$100 to \$150 each, the contract will amount to half a million dollars

New York.—Mr. Whitney Lyon, one of the governors of the Automobile Club, is enthusiastic over the result of his test of a new electric "auto." In this vehicle, with only a single charge of the battery, Mr. Lyon was able to travel more than than thirty-eight miles, and the machine climbed the steep Fort Lee hill. The "auto" weighs 2,000 pounds. It is of two and a half horse power, and has a storage battery of forty cells. Mr. Lyon started from the Waldorf-Astoria and proceeded to the Fort Lee ferry. After crossing the ferry the machine had before it a test under which all other electrically-propelled vehicles had failed. But this "auto" took to the hill as if it were just what it was looking for. Mr. Lyon continued north to Palisades avenue, turning west into Englewood. After running around Englewood for a while the return trip was made to West 66th street, this city, and there was still enough current left for a trip to the Battery.

Rocky Hill, Conn.—There is considerable talk of

Rocky Hill, Conn.—There is considerable talk of putting on an automobile carriage from here to the trolley. car station at Wethersfield. Several have pledged \$100 each.

# THE TELEPHONE WORLD.

### Blow to Bell Monopoly.

The completion of a deal whereby the Erie Telegraph & Telephone Company passes into the hands of the Telephone, Telegraph & Cable Company of America was announced on the 27th ult. The combined interests of the Erie Company on February 15 had 115,000 telephone stations in 2,300 cities and towns, and 250,000 miles of wire.

The company owns 71 per cent. of the Cleveland Telephone Company; 79 per cent. of the Northwestern Telephone Exchange Company, and 70 per cent. of the Southwestern Telegraph & Telephone Company, operating in Ohio, Minnesota, North and South Dakota, Texas and Arkansas, under licenses from the American Bell Telephone Company. It secured control of the Michigan Telephone Company and the Wisconsin Telephone Company in 1890, and last month it acquired control of the Detroit and New State Telephone Companies, both of Michigan. The capital stock of the Eric Telephone & Telegraph Company was increased in December, 1890, from \$5,000,000 to \$15,000,000.

The negotiations for the purchase of the controlling interest in the Erie Company have been conducted by President Latta and Charles E. Adams, of the Cable company, and President Gildden of the Erie system. The stock was gradually picked up in the market until the necessary amount was secured. The following men have been added to the board of directors of the Erie, representing the new owners of a centrolling interest in the property: Charles E. Adams, Lowell, Mass., who has been elected vice-president; John Jacob Astor, New York; George Crocker, San Francisco; Frank A. Cutting and Frederick A. Farrar, Boston; H. E. Gawtry, W. H. Gelshenen, Martin Maloney, C. W. Morse, Daniel O'Day, Frank Tilford and H. R. Wilson, New York, and William J. Latte, Philadelphia.

### Bill to Charter Virginia Telephone & Telegraph Company.

A dispatch from Richmond, Va., to the Washington "Star" states that it is "openly charged and not denied that the Southern Bell Telephone Company is behind the bill to charter the Virginia Telephone & Telegraph Company. This measure is exciting a great deal of interest in legislative circles. Nearly every city in the State has representatives here fighting its provisions. The principal objection to it is that it suspends a portion of the law that has been upon the statute books for fifty-two years, which in effect provides that a city or a town council shall have the right to say whether or not a telegraph or telephone company can use its streets."

Under this act the company proposed to be incorporated can enter a city or town without the permission of the council, but will be subject to such "reasonable regulations" as may be imposed. It is claimed by the opposition that the "reasonable regulations" provision would cause much litigation.

### The Fort Wayne Independent Company.

The Home Telephone & Telegraph Company of Fort Wayne, Ind., has just issued a directory of 1,850 subscribers. The Home Company was organized and began business about three years ago, and now has more than twice as many subscribers as the Bell Company, which formerly controlled the Fort Wayne service. The towns of Northern Indiana have nearly all established local concerns to fight the Bell Company, and have established exchanges covering nearly 1,000 cities and villages.

A new telephone company is organizing in Worcester, Mass., with the purpose of establishing an independent system of telephones. Some of the men interested are Fred W. White, former president of the common council; R. James Tatman, Charles H. Hildreth 2d, Charles M. Thayer and R. F. Taylor. The promoters of the new company are not ready to divulge the whole of the plans. Organization has not been completed. They are confident, however, the plan will be a go, and that they will be able to get the desired franchise from the city. They have sounded a number of individuals who have all said they would subscribe to the system, and some of them to the stock of the company.

Meeker, Col., is to be connected with the outside world by telephone during the coming summer. The Western Slope Telephone & Telegraph Company has been incorporated, and George T. White, formerly cashier of the Bank of Meeker, is the resident manager of the enterprise. For the present the line from Rifle to Meeker will be constructed, and bids have been called for the furnishing of about 1,700 posts for these forty-three miles. Later on the line will be extended to Craig Hayden and Steamboat Springs.

The New York Telephone Company has filed plans for the fireproofing of its exchange, 111 to 115 West 38th street. The work has been figured to cost \$45,000 by the architect, C. L.W. Eidlitz.

### The Independent Telephone Movement in Massachusetts.

The officials of the Massachusetts Telephone & Telegraph Company state that all subscribers of the company in Boston will be enabled to converse over the system next fall. The approach of spring will permit the contractors to push the work of laying conduits, which during the winter months has been slow and tedious. The company now has one mile of conduits laid and ready for service.

The company has wire connections with Springfield, Taunton, Brockton and other cities as well as towns in that section of the State. Within ten days a temporary central office will be opened and service will be inaugurated between the 40 subscribers on the line of conduits now laid. The service will be both local and long distance.

The Massachusetts Company has a plant in operation at Stoughton, Mass., with 100 subscribers. In Waltham the company has just closed negotiations for its central station and service in that city will be in operation very shortly.

### The Bell Company May Not Move.

The "Boston Journal" says: "Bell Telephone officials are disinclined to talk much about the sharp decline that has been recorded by their stock. They, however, profess ignorance of any intention on the part of the Western Union people to enter the telephone field. Recent intimations have come from official sources that strong hopes are still entertained by the Bell people that the Massachusetts Legislature might, during its present session, so shape legislation as to remove from Massachusetts. These expectations, in the light of recent developments, are quite full of suggestion, and they have aroused a suspicion in the minds of many people that the Bell Company has really practically [abandoned whatever purpose it may have had of removing its corporate residence from this State."

### Allegheny's New Telephone Line.

Mayor James G. Wyman, of Allegheny, Pa., has signed the ordinance giving rights of way to the Pittsburg & Allegheny Telephone Company, the new independent concern and branch of the United Telephone Company of Baltimore, which is building a national system to compete with the Bell monopoly.

At the annual meeing of the Canadian Bell Telephone Co. in Montreal recently the 20th annual report was read and was in part as follows: 2.841 subscribers have been added during the year, the total number of sets of instruments now earning rental being 84,923. The company now owns and operates 343 exchanges and 450 agencies; 1,686 miles of wire have been added to the long distance system in 1899; of these 318 miles are in the Ontario department, and 1,368 are in the eastern department. The long distance lines now owned and operated by the company comprise 18,920 miles of wires on 6,229 miles of poles. In December the directors, acting under the power conferred upon them, offered to the shareholders at par 9,900 shares of new stock, in the proportion of one share of new for each four of old, practically all of which have been subscribed for. Since the last report, the building in London has been completed, a building has been erected in Parkdale, and a building for the stores department has been erected in Montreal, all of which have been paid for. There is no encumbrance whatever on any of the company's real estate. The directors elected were Messrs. C. F. Sise, Robert Mackay, John E. Hudson, Robert Archer, Wm. R. Driver, Hugh Paton, Charles Cassils and Thos. Sherwin.

A dispatch from Elkton, Ind., states that the Cecil Telephone & Telegraph Company has been conveyed by deed, seed by Henry A. Richardson, of Dover, president of the ecil Company, to the Eastern Shore Telephone & Telegraph Company. The revenue stamps indicate that the value of the line in Cecil is held at \$30,000. Henry A. Richardson is also president of the Eastern Shore Company, which now includes the lines in Cecil, Kent, Talbot, Dorchester and Caroline counties. President Richardson has executed a mortgage covering all the property to secure bonds to the amount of \$100,000. By the consolidation direct communication will soon be had with every town on the Eastern shore of Maryland and on the Delaware Peninsula.

A bill has been introduced in the Assembly at Albany, N.Y., by Mr. Sanders, providing that any telegraph or telephone company that supplies information to any pool room or bucket shop shall be guilty of a misdemeanor on the first offense, and the second shall be punished as a felony.

At a special session of the city council of El Paso, Texas, recently held, a franchise was granted to a telephone company which proposes to string wires and rent 'phones at a lower rate than the Southwestern Company.

### Plans of the Knickerbocker Telephone Company.

It was stated by officers of the Knickerbocker Telephone Company recently that it was the intention of the company to begin its independent telephone operations in about eight months. By the end of that time it is expected that from 15,000 to 20,000 subscribers to the new system will have been secured. The company will not begin work until at least that number has been obtained; a preliminary exchange has been established in Twenty-third street, but not for public use.

The company has had men canvassing for subscribers in Manhattan for about two weeks. It was said that they were meeting with good success, although no definite information on this point was obtainable. The rates are claimed by the officers of the new company to be 60 per cent. cheaper than those of the Bell Company. The charge is to be \$120 a year for Greater New York, whereas the Bell price, according to the figures given out at the office of the Knickerbocker Company, is \$240 for Manhattan alone. Arrangements are now being made for the establishment of exchanges in Harlem, the Bronx, on the east and the west side, and for a main exchange at Broome and Crosby streets.

### Presumably Another Bell Concern.

Articles of incorporation were filed in Newark, N. J., on the 1st inst., by the North Jersey Telephone & Telegraph Company capital stock \$15,000. Its object is to construct telephone and telegraph lines across New Jersey from the Hudson River at Jersey City to the Delaware River at Camden

It is proposed to traverse the counties of Hudson, Essex, Union, Middlesex, Monmouth, Mercer, Ocean, Burlington and Camden. The incorporators are U. N. Bethell, Walter Brown, J. H. Cahill, Joseph Cavanagh and Howard W. Thurber. As will be remarked, several of the incorporators are officers of the New York Telephone Company.

The McPherson Telephone Company has applied to the city council of Hutchinson Kan., for a franchise to construct and operate a telephone system in that city. The company does not propose to cover the town with 'phones, unless the people want them. All it wants is the right to establish a central station there for a long distance system. It now has between thirty and forty towns on its list line. If Hutchinson is added the list of towns which it will cover includes Hutchinson, Ellinwood, Great Bend, Peabody, Sterling, Chase, Bennington, Newtown, Marlon, Lyons, Salina, Mcund Ridge, Inman, Canton, Hillsboro, Little River, Lindsborg, Lehigh, Marquette, Gypsum City, Windom, Galva, New Cambria, Conway, Hesston, Canada, Mitchell, Elyria, Halstead, Truesdale, Sparta, Bridgeport, Assaria, Brookville, Mentor, Roxbury, Smolan, Kipp and Bavaria.

The Baltimore, Md., city council has passed a resolution requesting the Legislature to repeal the telephone conduit bill of 1899, under which the Chesapeake & Potomac Telephone Company has the right to construct conduits in the beds of the streets of that city.

At a recent meeting of the stockholders of the Gainesboro Telephone Company, held at Cookeville, Tenn., new officers were elected for the ensuing year. Manager J. N. Cox was re-elected. The headquarters of the company will remain in Sparta.

Binghamton, N. Y., will shortly have a police telephone system such as exists in Elmira. When the system is installed the work will be done by the Pennsylvania Telephone & Telegraph Company.

The new telephone system recently installed by the Fire Department in this city was tested a few days ago and pronounced satisfactory.

A franchise has been granted to the Rocky Mountain Bell Telephone Company by the city council of Paris, Idaho.

### TELEPHONE INCORPORATIONS.

The Carolina & Virginia Telephone Company, Henderson, N. C. Capital stock, \$10,000. Incorporators: H. P. Strause, F. C. Toepleman and J. H. Bridgers.

Muskingum Valley Telephone Company, Zanesville, O. Capital stock, \$10,000. Incorporators: R. L. Holland, J. R. Voll, H. Bethel, W. M. Bateman, J. Blankenbumer.

The Wasco Southern Telephone Company, Wasco, Ore. Capital stock, \$500. Incorporators: J. N. Burgess, F. N. Wallace and H. C. Roper.

### **ECTRICAL** SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

### NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 152@16c.; Lake, 16@162c.; casting, 152@152c.

The General E'ectric Company has declared a regular quarterly dividend of 11 per cent. payable April 14.

The Worcester (Mass.)) Electric Light Company is preparing to spend \$125,000 for underground conduits this year.

The Philadelphia Traction Company has declared a dividend of \$2 per share, payable April 2 to stock of record March 10.

Three of the electric lines connecting Cincinnati and Dayton have been merged into the Southern Onio Traction Company.

The Manchester (N. H.) Electric Company has notified the secretary of State of an increase in its capital stock from \$600,000 to \$1,000,000.

Directors of the Calumet and Hecla Mining Company have declared a dividend of \$20 per share, payable March 3) to holders of record March 5.

February gross earnings of the Union Traction Company of Chicago were \$520,593, an increase compared with the same month last year of \$36,697.

For February the Metropolitan Street Railway Company of New York City reports gross earnings as \$1,043 984, or \$213,476 more than for February, 1899,

The United Power and Transportation Company of Philadelphia, Pa., has called a payment of \$10 a share; one installment for April 2 and the other for

The South Side Elevated Railroad Company of Chicago, has declared a quarterly dividend of  $\hat{q}$  of one per cent., payable March 30. Books close March 20 and reopen March 31.

An issue of \$35,000,000 bonds to pay for the construction of the tunnel rapid transit work was authorized on the 1st inst. by the Board of Estimate and Apportionment of New York City.

The stockholders of the Hulan River Telephone Company have voted to increase the capital stock from \$2,000,000 to \$3,000,000. The addition will be used gradually for extension.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Buat, 15@ 7; New York Electric Vehicle Transportation, 7@8; New England Transportation, 5@6.

The Washington Traction and Electric Syndicate has offered \$100 a share for control of the Capital Traction Company, which has \$12,000,000 in stock and is the only line outside the consolidation.

The New York Gas and Electric Light, Heat and Power Company has secured control of the Queens Borough Electric Light and Power Company by purchasing \$250,000 of its bonds at d \$255,000 stock.

Stockholders of the Consolidated Traction Company of Pittsburg, Pa., will hold a special meeting March 31 to vote on the proposition to lease its property and franchises to the new Union Traction Company.

The Western Union Telegraph Company has completed the purchase of the lines of the Descret Telegraph Company, heretofore owned by the Mormon church. The wires extend throughout  $U_1ah$  and into Idaho and Nevada.

First consolidated 4s and income 4s of the United Railway and Electric Company of Baltimore and \$500,000 capital stock of the New Haven Iron and Sceel Company have been regularly listed on the Philadelphia Stock Exchange.

The United Gas & Electric Company of Syracuse, N. Y., was incorporated at Albany last week with a capital of \$4,000,000 to manufacture gas and electricity. The capital stock is divided into \$1,000,000 preferred and \$3,000,000 common stock.

A bill giving to the New York Gas, Electric Light, Heat & Power Company privilege to lay electric subways similar to those now owned by the New sterdam Gas Company has been advanced to the third reading in the Legislature the privilege to at Albany.

A deed from the Kane's Falls Electric Company to the Hudson River Water Power Company for \$2,365,000, for lands, rights of way and water power in Corinth, Morean, Luzerne and Queensburg has been recorded in the office of the clerk of Saratoga County, N. Y.

The Raritan Traction Company, with a capital of \$1,000.000, has been incorporated and the papers filed at the County Clerk's office in New Brunswick, N. J. The company will operate the trolley road which is being constructed at Perth Amboy. The Lewissonns, who run the Raritan copper works are said to be behind the corporation.

Brown Brothers of New Yerk City have made a cash distribution of 33\} per cent. from the proceeds of the sale of the new securities, which were issued by the St. Louis Railway syndicate to take the place of the securities of the different companies absorbed. This makes the second distribution, 15 per cent. having been read companies. paid some time ago.

Officials of the Chicago Union Traction Company, controlled by the Whitney-Elkins syndicate, and of the Chicago Consolidated Traction, owned by Charles T, Yerkes and his associates, met in this city on the 5th inst. for the purpose it was reported, of closing up the deal for the amalgamation of the two corporations. Nothing definite could be ascertained as to the outcome of the meeting, beyond a report that the arrangements were proceeding satisfactorily.

The Edison Electric Illuminating Company recorded on March 1 a mortgage for \$15,000,000, made in f4vor of the State Trust Company. The mortgage was originally recorded in 1895. It is supposed that the document was recorded a second time, owing to some technicality. There was also filed with the Secretary of State at Albany on the same date certificates of merger of the Manhatan Electric Light Company, capital \$1,500,000, and of the Harlen Lighting Company, capital \$250,000, with the Elison Electric Illuminating Company of New York City. The Edison Company some time ago was practically absorbed by the New York Gas, Electric Light, Heat and Power Company.

The Grand Jury of New York will investigate the wrecking of the Third Avenue road, and in the meantime the temporary receiver, ex-Mayor Hugh J. Grant, has decided upon a plan whereby holders of the stock will be assessed from 50 to 66% per cent. on their stock in order that the present pressing financial needs of the road may be relieved. Ultimately 5 per cent. notes will be issued at a discount of 10 per cent. to the full extent of the indebtedness. Receiver Grant said yeterday: "I expect to be able to present my final schedules dealing with the affairs of the road to Judge Lacombe on March 14. These schedules will set forth in detail my plans for reorganization. It is not my business to investigate or prosecute politicians or others who are charged with having wrecked the road. My duty is to bring order out of chaos and to endeavor to place the Third Avenue road on a sound financial basis again." There are liens on the road for \$6,000,000, two electrical companies having claims for large amounts. At 1 o'clock yesterday the stock was quoted at 55, and one year ago the shares were worth 245.

Vol. XVIII.

### EDITORIAL NOTES.

Again the New York Stock Exchange.

Frequently in these columns we have referred to the lax methods which have prevailed on the New York Stock Ex-

change regarding the listing of undesirable securities as well as to the annual reports issued in the past by industrial corporations, and which have often been nothing more nor less than a clever jugglery of figures.

Our warning as well as that of other leading papers was ignored with the result that the investing public has been made to suffer through the manipulation by unscrupulous speculators of the stock of the Brooklyn Rapid Transit Company, and still more recently of that of the Third Avenue Railroad Company. In answer to the query, "When shall Wall Street be treated to the unusual sight of seeing honesty in high places?" the financial writer of one of the daily papers takes practically the same view of the situation that we always have, and says:

"The Stock Exchange itself is largely responsible for this condition of affairs. The compulsory filing of reports by all of the corporations whose shares are dealt in openly upon the floor of the Exchange, would mitigate to some degree the prevailing evil. The gambling element seems to make the rules of the Exchange. The admission of any and every class of security to the unlisted department, where stocks are dealt in about which the members are quite as much in the dark as the public, is steadily becoming more of a public scandal.

"Publicity concerning the statements of earnings, balances and outstanding securities does not always remedy an ill, as is shown by the disclosures in the case of the Third Avenue Railroad. Here was a company whose stock was regularly listed and which made reports not only to the Stock Exchange, but also to the State officials. The wreckage, of this once gilt-edged corporation, whose credit was as good, if not better, than most similar companies, is now floating in and out of the brokers' office. It is becoming a serious question to Wall Street as to when these cases of financial trickery shall cease. First it was the American Tobacco Company which shamefully manipulated its dividend, then a number of similar organized 'specialties' deliberately "thimble-rigged" the speculative public,

and in the meantime Third Avenue stock became a football because even the stringent rules concerning the reports which must be made by regularly listed corporations were violated. It is safe to say that in no great financial center of any nation on the globe would such shameful manipulation of corporations and securities be permitted."

That such is the case there is little doubt, and it is to be hoped that the Board of Governors of the New York Stock Exchange, now that a crash has come, will awake like Rip Van Winkle and fully realize the responsibility that devolves on them and their duty to the public.

Carbons Dutiable at 35 Per Cent.

On November 9, 1897, Twenty-four Inch and January 17, 1898, carbons were received through the Custom House at New York by

two importing firms upon which the Collector assessed duty at 90 cents per hundred, under the provisions of paragraph 98 of the present tariff act. The merchandise in question consisted of sticks or rods of carbon, each 24 inches in length, and in the assessment of duty the Collector mentally divided each carbon into a length of twelve inches, and assessed duty upon each twelve inches. The importers entered protest upon the plea that they should have been more correctly classified under the provisions of paragraph 97 of the same act in which it is provided that "articles and wares composed of . . . carbon, not specially provided for . . . if not decorated in any provided for . way" shall be dutiable at 35 per centum ad valorem.

From the testimony offered it was found by the Board of General Appraisers that the rods of carbon in question were identical with those covered by a previous decison of the Board in re Downing, which decision was reversed by the Circuit Court for the Southern District of New York, and was afterwards affirmed by the Circuit Court of Appeals for the Second Circuit, the latter court agreeing with the finding of the Board that the carbons were ultimately intended for use in electric lighting, but to make them suitable for that purpose it was necessary that they should be first cut into proper lengths, after which the ends must be pointed or ground before they could be used for the purpose named. It was therefore held that they were dutiable under said paragraph 97, under the provision above

quoted, and not as finished carbons suitable for electric lighting.

Following this decision the Board sustained the claim made by the importers that the carbons were dutiable at 35 per centum ad valorem, under said paragraph 97, and reversed the decision of the Collector, at the same time giving instructions that the entries should be reliquidated in accordance with the decision just quoted.

\* \* \*

"The Ships that Pass in the Night." When wireless telegraphy was first brought to the attention of the public, the consensus of opinion seemed to be that this

method of transmitting messages would never amount to much in a commercial way and that its field of usefulness would be extremely limited. Such has not, however, been the case, owing in a great measure to the indefatigable work and untiring efforts of William Marconi. Besides being made use of as a means of communication between light ships and the mainland the wireless telegraphy system has been tried with success for signaling purposes between men-of-war, and still more recently it has been demonstrated in the Transvaal that this method of transmitting messages has much to recommend it for sending dispatches from one army corps to another during an active campaign.

The latest application however of this new method of telegraphy is in the merchant marine. The Kaiser Wilhelm der Grosse of the North German Lloyd line, which arrived in New York from Bremen recently, had on board a Marconi transmitter and receiver, by means of which intelligible signals were transmitted to the mainland on the departure of the steamer from the other side. The messages were sent from the liner to a receiving station off the North German coast fifty miles distant and were communicated over cable and land wires to Bremerhaven, the port of Bremen, ninety miles away.

Ever since Marconi demonstrated the practicability of his system, officials of the North German Lloyd line have been desirous of applying it to one of their liners. With this end in view permission was obtained from the German Government for the erection of a station on the Borkum lightship, but owing to an accident the lightship had to be abandoned as a receiving and transmitting station and Borkum Island at the mouth of the Ems was substituted.

When the Kaiser Wilhelm der Grosse, which left Bremen on February 28, was fifty miles from the receiving station messages concerning the vessel's movements were sent from her. In charge of the operating room on the ship was one of Marconi's assistants. While it was evident that the messages had been received at the station, no replies were received aboard the ship until she got within thirty-five miles of the island.

This was accounted for in the difference of height of the masts on the vessel and on the island. The mast at the station was 185 feet high, while that on the vessel was only 135 feet. From messages received on the ship it was learned that there was communication by the wireless system from the liner to the station when fifty miles distant. Greetings between the two continued until the Kaiser was beyond signaling distance.

The success of this experiment has led many to believe that the officials of the North German

Lloyd line will in the near future have all their ships equipped with the wireless system. If this is done it is suggested that the Nantucket South Shoal lightship be made a receiving station, which would enable news of the approach of a vessel being received in New York City some fifteen hours before her arrival. Another use which might advantageously be made of the Marconi system, were all the principal transatlantic liners to adopt it, would be in signaling passing ships at night. As is well known the steamships of the merchant marine have no international system of night signaling, and in view of this fact the wireless system would seem admirably adapted to this purpose.

### Electric Light Rays as a Curative Agent.

Some time ago the scientific world was more or less startled by the announcement that a Danish

professor, by working on the principle laid down years ago by Prof. Widmark, had succeeded in curing various ailments by means of light emanating either from the sun or an arc lamp. This method of treatment is known as phototherapy, and in a word consists in subjecting the diseased part to ultra-violet light rays. In an excellent article on this subject, which recently appeared in the N. Y. "Journal," the light treatment, as applied to cancer, is referred to as follows:

"The principle of phototheraphy is that the germs of cancer are unable to live after the onslaught of a tremendously strong light. By means of a special contrivance sunlight may readily be used for the purpose. To obtain sufficient light artificially a 22,000 candle-power arc lamp is used. The light is deflected into a three-foot telescope arrangement to intensify and concentrate it, exactly on the principle of a burning-glass. But in order to prevent burning of the flesh and scorching of the skin it is necessary to rob the white light of the heat rays, leaving only the light rays to pass.

"This is done by substituting quartz lenses, which intercept heat rays, in the telescope for ordinary glass lenses. The light rays are then cooled still more by passage through clear cold water. A device clamped to the patient's face and connected by a tube to the telescope assures that, despite movement of the patient, the light will be projected on the exact spot to be treated. This spot measures a surface from \(\frac{1}{2}\) to \(\frac{1}{2}\) of an inch square. As each afflicted spot must be treated, and as each spot requires one hour's steady application, the treatment is a rather tedious one. It is not painful."

That sunlight is almost as necessary a sustenance to human life as food has long been known, and in many cases, especially in those ailments pertaining to children, doctors have for years recommended sun baths. It was not known, however, until Prof. Finsen took up the study of this subject in a scientific manner that some of the colors of the spectrum were fatal to certain forms of microbes and bacteria. As regards the application of Dr. Finsen's process to that dreaded disease known as cancer, although learned doctors agree to disagree as to whether it is due to a specific microbe, bacillus or germ, it is claimed that surface cancers have been cured by the light rays, which in itself is a great triumph of science.

Probably the first Finsen phototheraphic machine to be introduced into this country has recently been installed at the St. John's Hos-

pital in Brooklyn. With this apparatus careful and exhaustive experiments are being made which, providing they prove successful, will do much toward alleviating human suffering and immortalizing the name of Finsen.

### UNDER THE SEARCHLIGHT.

### Notes and Comments on Various Topics.

ELECTRICAL contractors are complaining of the scarcity of electrical workers in Pittsburg at the present time. There is a demand for about 100 additional electricians and the unusual lack of workers will be made a sutject of action at the meeting of the Electrical Contractors' Association to be held on Friday.

The entire Chicago suburban train service of the Pennsylvania Railroad probably will be abandoned. Local officers have recommended to the management in Pittsburg that all of the trains, with the exception of one in each direction, morning and evening, be discontinued as soon as practicable. Trolley competion is the principal cause of the action.

The "Electrical Engineer," London, is au thority for the statement that the introduction of the metric system of weights and measures in Russia is likely to take place before long, as a scheme to that end, prepared by the Ministry of Finance, has already received the approval of the Council of State on the condition that it should be supplemented by a scheme for organizing the aid which different scientific societies and the universities are ready to render in the verification of the new weights and measures for commerce. This latter scheme is nearly ready and will shortly be brought before the Council of State.

With a deafening noise that shook the buildings in the neighborhood, a compressed air tank in one of the 29th street cross-town air cars of the Metropolitan Street Railway Company of this city, that had apparently been overcharged, burst a few mornings ago in the car sheds in Twelfth avenue, between 23d and 24th streets. Three men were badly injured and half a dozen other employes were more or less cut by broken glass. The car was completely demolished. So much for compressed air as a motive power for street cars.

An exposition of automobiles is to be opened in Mexico by an American who is now in New York arranging for the shipment of a large number of automobiles of different systems. A French paper, commenting upon this fact, says: "It is in France that the automobile industry has shown the greatest development. Nevertheless, here are the Americans who are outstripping us and virtually cutting the grass from under the feet of the French manufacturers."

In a recent issue our worthy contemporary the "Electrical World and Engineer," commenting on the efforts that are being made to reduce telephone rates in New York to a reasonable figure, said: "More than one newspaper in New York City is still carrying on an agitation for lower telephone rates. Intrinsically, there can be no objection to that any more than there can be to an agitation for lower prices at the opera, for cheaper ice, cheaper coal or other convenience or commodity. We all want things cheaper, Heaven for some

divine purpose implanted that desire in the breast of mankind just as it did the other desire to derive all the income that the traffic can stand. As between these opposed tendencies the happy mean is usually found, but it certainly is not discovered by all who are hammering away at this telephone question. The assumptions and arguments as to the low rates at which telephone service can be given are positively absurd and ridiculous, and even when accurate bear no relation to the point at issue." To any one who is acquainted with the situation, it is only natural that the "Electrical World and Engineer," which forms a part of what might be termed a small electrical newspaper monopoly, in that it as well as several other periodicals are under the control of one well-known gentleman, should seek to uphold and sustain another monopoly, namely, the New York Telephone Company in its depredations on the public.

ELECTRICITY will take the place of steam as the motive power for rope-making in the Charlestown Navy Yard this week. It is the first time electricity has been utilized for power in such work, and the operation of the plant will be watched with interest. The necessity for the change and increasing facilities of the ropewalk was demonstrated in the Spanish war. This is the only rope plant owned by the Government, and the greater part of the rope used in the service is made there.

Mr. E. B. Baldwin, who has recently returned with the Wellman polar expedition, is firmly convinced that it is possible to utilize the great electrical energy of the Aurora Borealis. Observations he made in the Arctic regions convince him that there are great electrical currents passing through the earth from the north to the south pole which might possibly be utilized for many purposes.

The new invention for dispensing with telephone girls and substituting automatic apparatus, thus placing subscribers in communication without an intermediary, was tested last week in Paris, France, by the Minister and the telephone officials, who were delighted with the results.

ELECTRICITY is soon to be put to a novel use by Anton Schultheis, a florist of College Point, L. I., who will try the power of electric light to hasten the blooming of flowers. He devotes much attention to chrysanthemums and carnations and believes that if his greenhouses are brightly illuminated during the night his plants will flower in at least half the usual time they require. He has closed a contract with the New York and Queens Electric Light Company to have electric lights in large numbers put in all of his greenhouses.

WORK upon the electric railroad which is to connect the city of Lerdo, Durango, with the flourishing town of Torreon, Coahuila, has been begun.

According to a cable dispatch from Paris, France, the Bois de Boulogne and Vincennes are to be lighted by electricity. Thus ends a long struggle in the Municipal Council. The work will begin immediately upon the voting of the necessary grants. As far as the Bois de Boulogne is concerned the work will be divided into three divisions. They will commence first by the installation of the 110 incandescent lamps to light the Allée des Fortifications in

the part going from the Porte Dauphine to the Porte Maillot and across the Bois as far as the Pont de Suresnes by the Allèe de Longchamp, part of the Route des Tribunes, and of the Route de Suresnes. The two other divisions will include the Allées du Tour du Lac, the Route de Saint-Cloud, the Ronde de la Muette at Neuilly, and the Route des Lacs, at Passy, and the lighting by electricity of the Avenue de l'Hippodrome and part of Avenue de la Reine Marguerite.

Under a recent decision of the Governor of Natal it is provided that a rebate shall be allowed equal in amount to the total duty levied on all importations of battery cloth, gauze, matting, sieving and screening; crucibles, electric cable, or wire and posts for same and their fittings; electric lamp posts and their fittings; electric lamps and switches, not including ornamental or fancy lamps, also fittings for indoor lighting.

According to "Indian Engineering," there will shortly be a trolley line "On the Road to Mandalay." A scheme recently submitted by the Burma Electric Works Syndicate, was accepted by the Mandalay Municipal Committee with the result that a trolley road will be commenced within one year, to be in running order in three years.

PREPARATIONS are now being made for the trial of an electric third rail on the New York, New Haven & Hartford Railroad for heavy traction. The principal points of the system are that the rail is not charged with electricity after a train has passed over it and that enough power can be obtained to propel heavy trains as well as the single trolley cars, for which speed is more necessary than power. The third rails which have thus far been used are "alive," or charged with electricity at all times. The legislators of Connecticut, while trying to help electrical development, have frequently protested against the "live" third rail as a menace to life.

The Senate Committee on Naval Affairs has ordered a favorable report upon the bill to construct a cable to Manila by way of Honolulu, Midway Islands and Guam. It is to be under the direction of the Navy Department and to be a Government cable. Senator Hale, the chairman of the committee, was authorized to prepare a bill and report it to the Senate. It will provide for immediate construction of the cable only from San Francisco to Honolulu, but it contemplates the ultimate extension of the cable to the Philippines and also to Hongkong. It is estimated that the cable to Honolulu will cost between \$3,000,000 and \$4,000,000.

A PATENT has been issued for a new electrical advertising device. It is proposed to sink in the pavement a glass disk to be lighted at night from below.

In a recent issue of ELECTRICITY it was announced that a resident of Pittsburg, Pa., had invented a magnetic switch to be used on trolley roads. The apparatus, which is now being given a trial on one of the roads in that locality, consists of an arrangement of electromagnets by means of which a motorman controls the switch from his position on the car. The power used for throwing the switch taken from the trolley wire at a given point

from the switch. The car is stopped about thirty feet from the switch, and this brings the trolley wheel at the top of the car's trolley pole in connection with a small wire that runs to the magnets that are enclosed in an iron box on one of the side poles on the curb line of the street. The movement of the magnets works the rods that run under the pavement to the switch, and by means of the controller the motorman is able to throw the switch tongue in either direction.

THE Susquehanna Electric Power Company has so far matured its plans that within a comparatively short time the city of Baltimore may get its electricity for lighting and power from the falls of the Susquehanna River. The necessary real estate has been secured and the company, with \$7,000,000 capital, has been formed. It is proposed to build two power houses, each capable of producing 40,000 electrical horse power at the normal flow of the river. The general plan of the plant will be the same as that at Niagara Falls.

CHICAGO is preparing to use the drainage canal as a source of electrical power. It is thought that the power can be used with profit as a motive power on the canal in much the same way that it is on one or two of the canals in Germany.

THE director of the Bilbao section of the Spanish Telegraph Department, who is called Señor Don Esteban de Urrestarasu y Gutiérrez de Pármo, has invented an apparatus which, it is said, serves for the double purpose of preventing the entanglement of telegraph wires and of cutting the wires which have become entangled. Why the latter should be necessary, says the London "Electrical Engineer." if the apparatus effectually prevents the former, is not quite clear from the meagre details at hand at present. Anyhow, the Spanish Government have decided to institute practical trials with the "nemapiro," as the instrument is called, and further events will be awaited with interest, as an invention of this sort would fill a long-felt want-if it can be made to work properly.

AKRON, Ohio, claims to be the first city to adopt the automobile for use as a police patrol wagon. Henceforth the lawbreakers of that enterprising town will ride to station house and police court in up-to-date style. It is expected also that hurry calls will be answered in half the time formerly required, as the wagon will be kept ready to start on an instant's notice. The vehicle has been in use long enough to indicate its complete success. It is capable of running at the rate of twenty miles an hour on country roads, and its electric batteries will carry it for twenty-five miles without recharging. It is capable of making rapid headway through clay, mud or heavy snow, and answers every requirement of the service for which such a wagon is intended.

ENGELBERT HOHENBERGER, a Bohemian shoemaker residing at Bodenbach, a little town about eighteen miles from Dresden, has invented a walking shoe which is heated by means of an electrical apparatus in the heel, with tubes conveying heat under the surface of the sole. Unherveer, the inventor of the ordinary winter shoe, says that it has been conclusively proved that the new electrical invention gives absolute protection from snow and rain at a cost of 25 florins (\$11).

# THE INSTITUTION OF ELECTRICAL ENGINEERS AND ELECTRICAL STANDARDIZATION.

### [From our London Correspondent.]

The paper by Mr. R. P. Sellon on "The Standardization of an Electrical Engineering Plant," has, on account of the importance of the subject, roused more interest and discussion than any previous paper of the present session. The charges brought by the author, as representing manufacturing interests, against consulting engineers, who he declared were primarily responsible for the lack of standardization in English electric lighting works, led one to anticipate more or less of a pitched battle between the representatives of the two interests, but on the first night of the discussion most of the speakers were from the ranks of manufacturers-in fact only one, and that Mr. Robert Hammond, represented consulting engineers. Doubtless consultants will make use of the opportunity of excusing themselves at the resumed debate.

The reading of the paper was immediately followed by Mr. R. E. B. Crompton, who said that up to the present the manufacturers were the people who had suffered from the vagaries of the consulting engineer in not being allowed to standardize more than they had done. However, no harm resulted, but a great deal would have resulted if standardization had been carried out earlier. Consulting engineers had not varied the standards much in English electric light works, but the great variety of periodicity pressed hardly upon the manufacturers of motors, lamps, etc. Motors should be standardized, because it was only after standardization that the small user could obtain them at the price he was prepared to pay. The smaller sizes \frac{1}{8} and \frac{1}{6} hp. were becoming standardized, and standardization of motors for driving tools in workshops was likely to become general almost at once. Mr. A. B. Blackburn (Electric Construction Company) said tuat each manufacturer must begin at home and standardize his own types, and try to convince the user that he had good reasons for it. They might thus be able to come to a common understanding as to what were the best types of machines. He thought in the supply of alternating current machinery, they were already arriving at something like standardiza-He hoped that engine makers would help electrical engineers in their efforts to obtain standardization. As matters are at present, dynamo makers find considerable diversities of engine speed when drawing up their tenders, and they have to get out tenders for three or four different dynamos to accommodate different types of engines.

Mr. J. Slater Lewis (P. R. Jackson & Co.) thought the subject of standardization ought to be attacked very vigorously by English engineers. He made a few remarks upon the effect thereof upon foreign competition, one of the points raised in Mr. Sellon's paper. He was of the opinion that a committee should be formed to suggest certain sizes of motors and dynamos. His own firm were commencing to standardize motors, and they hoped in a short time to sell standard sizes and nothing else.

Mr. E. Johnson spoke of his experience in America in the standardization of constructional detail. Mr. J. S. Raworth said that standardization of details had a much greater effect upon a station than most people were aware of, even more than periodicity or pressure. Mr. Mark Robinson (Williams & Robinson)

son), speaking as an engine maker, said that attempts made at his own works to standardize had been thoroughly successful since they commenced a few years ago. If the consulting engineer stated whether he wanted high or low speed engines, and left a great deal to the discretion of the manufacturers standardization would be considerably helped. A year or two ago an order came to him for a 1,200 hp. engine. Gauges were at once gotten out so that others could be made similar to it, although it was a very large size then, but the wisdom of this course was soon apparent, for before this one was out of the shop orders had been booked for eighteen more. On the matter of standardization of engine speeds, dynamo-makers had only to ask for what they wanted and the engine-makers would do the best in the matter. Mr. R. Hammond (consulting engineer) said

circuit than on the surrounding ones, this one could use up the dim lamps from the others, but this he said was a selfish policy.

### RECENT NIAGARA POWER INSTALLATION.

BY FRANK C. PERKINS.

Messrs. Pratt & Letchworth have installed in their malleable iron works at Buffalo, N. Y., a complete electric plant for operating their entire works with Niagara power.

A large rotary transformer of the three-phase General Electric type is utilized by supplying power to the countershafting, taking the place of the steam engine previously used, and at the same time it supplies a direct current to the electric cranes and direct current motors in other parts of the works, replacing the direct

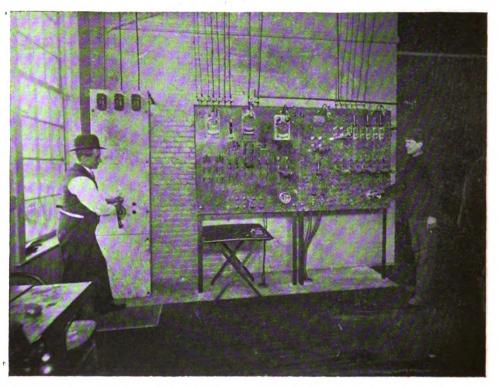

Fig. 1.—High Tension 3-phase A. C. Switchboard and Low Pressure D. C. Switchboard.

that it was necessary to get the best plant and to obtain it as economically as possible. He claimed that consulting engineers were not so black as they were painted. They had to see many types of engines and dynamos, and they advised the user as to the best. The Institution Standardization Committee had fixed the standard periodicity at 50, after which they went on to say that there should be a periodicity of 100 for systems using transformers in people's houses. Mr. Hammond considered that the committee was mistaken in not striking out the 100 periodicity altogether.

Mr. S. Z. de Ferranti expressed regret that Mr. Sellon's paper had not been read 10 or 12 years ago, as to his mind much of the evil of non-standardization had now come to stay. This they could see in the numbers of different periodicities in generating stations all over the country, and also a great many different engine speeds. Once a periodicity was fixed it was very difficult to get an engineer to alter it. Americans started with 120 periods and kept to that standard until not long ago having found that it was too high they halved it, with the result that 60 periods is common to-day. He had heard it argued that standardization of voltage was not the best thing in all cases, because with a slightly higher voltage on one current generators previously used for this purpose.

The high tension alternating static transformers are three in number and are located in a separate room enclosed with brick walls back of the switchboards, as shown in illustration (Fig. 1). The attendant is seen ready to close the high tension circuit at the switchboard at the left. Oil enclosed switches are used and the three-phase current is reduced in pressure from 11,000 volts at the sub-station, where the current is taken from the Niagara lines, to 2,200 volts as it enters the works of Pratt & Letchworth.

- It is again transformed from 2,200 to 170 volts alternating current, and by means of the rotary converter, shown in Fig. 2, a direct current of 250 volts is supplied to the shop motors and electric crane. This machine has a capacity of 800 amperes and also delivers from its pulley 100 hp. to the main shafting from the pulley at the left. The rotary has a speed of 750 revolutions per minute and the frequency is 25 cycles, the total capacity being 250 kw.

Niagara current is now operating the entire street railway system of Buffalo and furnishes power for lighting the entire city with street arc lights and a complete alternating incandescent system for residence and business places through the Cataract Power & Conduit Company and the Buffalo General Electric Company, the former corporation receiving the Niagara current at the city limits and distributing the power entirely for large users, the meters apart, no insulation being used even where they came in contact with the rocks for a few meters at the Grands-Mulets terminal. Having been found to operate satisfactorily with the telegraph instruments they were tested for resistance and insulation. These measurements showed that the insulation was

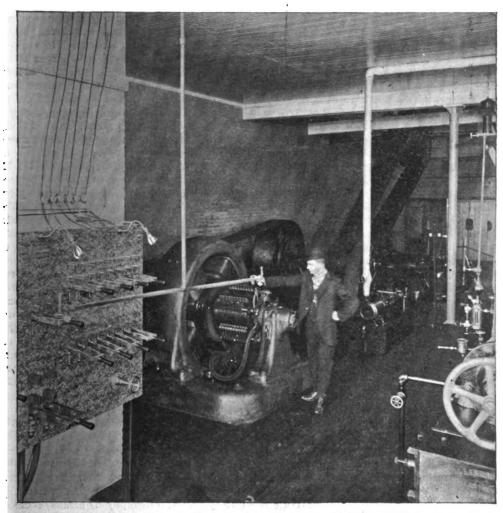

FIG. 2.—THREE-PHASE ROTARY CONVERTER AND MOTOR COMBINED.

latter company furnishing the small users with power through their 500 volt direct current power circuits about the city.

### Telegraph Wires on Glaciers.

In a communication to the French Academy, published in a recent issue of "Comptes Rendus," the veteran astronomer, M. Janssen, gives some interesting information as to the insulating power of glacier ice, as developed in the telegraph work conducted in connection with the Mont Blanc observatory during the past year. These investigations were conducted by MM. Lespieau and Cauro, and the unfortunate feature of the work was the fatal accident to M. Cauro almost at the outset of the experiments.

The undertaking upon which the studies were made consisted of the connection by wire of the summit of the mountain with the Grands-Mulets, and the interesting feature of the experiment was the fact that the naked wires were permitted to lie directly upon the surface of the glacier, without any support or insulation.

The wires used were the regular French Government standard of galvanized iron, 3 millimeters in diameter, and the length of the line was about 1,700 meters, or a little over a mile, this being the distance between the terminals, and hence the length of each half of the circuit. The wires were laid directly upon the surface of the ice, being about 5

almost perfect. Galvanometer deflections on the line at points distant 300, 600 and 1,700 meters from the lower station were practically identical with those at the terminal, and the resistance of the line, as tested by a Wheatstone bridge, was found to lie between 56 and 57 ohms, while with perfect insulation it would have been but 59 to 60 ohms, so the loss was insignificant.

The results of these experiments, while per-

The results of these experiments, while perhaps of limited application, may yet prove of much importance in mountain exploration work, since it is shown that telegraph wires may be laid over the ice in the trail of an exploring or military party with but little labor

or cost.

One point which must not be overlooked in this connection is the influence of cold upon the battery. The resistance varies notably with the temperature, probably due to the reduction in strength of the chlorhydrate of ammonia caused by deposition of the salt. Down to temperatures not lower than 16° C. the electromotive force remains practically constant, after which the solution slowly freezes. When the mass has become solid the temperature continues to fall, and the resistance increases enormously. These points must be taken into account, especially in connection with electrical measurements made at low temperatures.

In view of the fact that the surface of a glacier is always in slow motion the permanency of a telegraph line laid upon the surface of the ice cannot be insured. M. Janssen promises some future data upon this point, which must necessarily involve observations made over a considerable period of time, but as such lines will probably be laid only for temporary purposes, this is not a matter of fundamental importance.—The "Engineering Magazine."

### MICA MINING IN BENGAL, INDIA.\*

### BY A. MERVYN SMITH.

The zone of mica-bearing rocks in Bengal has been worked for centuries by the Hindus. Mica is largely used by them for ornamental purposes, such as inlaid work, tassels, flowers, toys, banners. The large clear plates are much used by native artists for portrait painting as being extremely durable and not affected by heat or dampness, and impervious to the attacks of insects. The waste mica is ground to a coarse powder, and after being mixed with starch is applied to cheap cotton cloths to give them a sheen.

The great marts of mica for native consumption are Patna and Delhi. Dr. P. Breton, who visited these mines in 1826, found as many as 5,000 people at work at different mines. In 1849 Dr. McClelland gives the output as 100,000 maunds (a maund being 82 lbs.). In 1863 the statistical account of Bengal says 10,000 maunds were exported.

The native mines are of the most primitive kind. Open cuts along the outcrops of the pegmatite veins where books of mica are seen in any quantity. These cuts are continued down 20 or 30 feet till the sides become dangerous. No timbering is used to keep the sides from falling in, and frequently accidents happen and the miners are buried beneath the fallen walls of the reef. Where exceptionally rich stuff is met, and the vein-stuff is decomposed and soft to some 50 or 100 feet, inclines are put in, and follow down the rich shoots of mica in a most tortuous course, zig-zagging about from side to side with the leads of rich ground. Long lines of women near to each other and placed in double row, from the water level to surface, hand out earthen pitchers-called "gurrahs"-to one another; the full pitchers are handed up one line and the empties down the other. As many as seventy women are sometimes placed to remove the water from a mine not 35 feet in perpendicular depth. The incline, of course, was much more than this in length.

Where the reef is highly felspathic and of large size, decomposition extends to 100 feet or more, and it is here that their largest mining operations are carried on. In order to ventilate the inclines and draw out the mica, perpendicular shafts about two feet in diameter are put in. The author counted as many as thirty of these circular shafts along the strike of the reef and within a few feet of each other.

The miners are a local tribe called "Bandathis," the men, women and children all working at the time when they have no agricultural work in the fields. Work is only conducted in the dry months (November to May). Immediately the rains set in they return to the tillage of their fields. Work is only conducted in the day, beginning about 8 A. M., and giving over at dusk. Where the veins are hard, yet sufficiently rich to pay for the labor, large fires are kindled against the face of the lode, and when the vein stuff is sufficiently heated, water is thrown on to it, when the sudden cooling causes the rock to shrink and crack. Into these cracks wedges of soft iron, locally manufactured from the magnetite iron ores common in this neighborhood, are driven and large boulders detached. The exposed books of mica are chiseled out and taken to The books of mica are split into surface.

<sup>\*</sup>Abstract of paper read before the Institution of Mining and Metallurgy, London. From the "Australian Mining Standard."

sheets of about one-eighth of an inch in thickness. All the rough edges and flaws are trimmed off by means of a sharp sickle (called "hasawah"), and then sorted according to color and size. The sheets are in some cases very large, 18 inches by 24 inches being the largest in this district. In the Itakuri mine, Nellore district, plates 40 inches by 60 inches have been obtained.

It is only within very recent years that Europeans have taken up the mica industry. Mining is still conducted on purely native methods, described above, and, although 250 mines are at work in this district, on not a single one is machinery of any kind used. The same wasteful, slow and laborious system practiced by the natives for hundreds of years is still in vogue. Men are sent out during the rains to search for likely looking outcrops of mica. The mica schist, being softer than the other members of this series of rock, is eroded into valleys-the more quartzose beds making the ridges of hills. A certain amount of alluvium and talus from the adjacent hills covers the valleys.

After exceptionally heavy rain this surface deposit is washed off, and with it the decomposed felspar of the pegmatite veins, leaving exposed tufts of partially decomposed mica. The natives call these tufts "foo-foo," and believe that they grow during the rains, as they cannot account for their exposure at surface after a heavy shower, where there was nothing apparent before the rain. Having discovered several of these "foo-foo" spots, these are marked off for mining operations as soon as the dry season begins. Parties of men, women and children are set to work on these outcrops, and the books of mica-dug out, packed in loads of about 30 lbs., and brought in at dusk to the central store.

Here several skilled men are seated on the floor trimming the mica before it is packed away for market. Before each man is a stout peg, driven firmly into the ground and protruding about 18 inches. The books of mica are first split into plates about one-eighth of an inch in thickness, the mica easily splitting into laminæ of any thickness. The trimmers are provided with sharp sickles, and the point of this knife is used for opening the sheets. Imperfect laminæ are now peeled off of the plates till both surfaces show a clean, even face. The plate is supported against the side of the peg, and the sickle drawn downwards to trim off the jagged ends and irregularities along the edge of the sheets of mica.

After trimming the plates are sorted for the European market, the United Kingdom and America being the chief buyers. The sheets are first sorted according to quality, four kinds being recognized by the dealers. 1. Ruby mica, hard and tough. 2. White transparent mica. 3. Discolored and smoked. 4. Black mica and flawed.

The sheets are trimmed irregularly into any shape they will take to clear them of flaws. Should square, rectangular or diamond-shape sheets be wanted, a special rate has to be paid for these to allow for the great waste.

The sheets are packed in boxes of 1 cwt. and transported on carts to the nearest railway station, 100 miles distant. From thence it goes to Calcutta and shipped to London or the United States of America.

There cannot be the slightest doubt that when European methods of mining are introduced the cost of production will be materially reduced, the waste will be much less, and a

better quality of mica will be secured. At present only the decomposed, or partially decomposed, vein stuff is mined. Here the mica must also undergo a partial decomposition, but of course not to anything like the extent of the felspar. In the hard vein stuff the mica is hard and tough, and this class of mica commands a better price.

Some of the veins yield black mica (biotite). This is largely used as a drug by Hindus and Mohammedans. Reduced to a powder, it is supposed to be very efficacious in cases of dysentery.

The sheets of mica are at times very queerly marked. In places one-half of each sheet will be muscovite and the other half biotite, the line of division between the two colors being a perfectly straight line, and there being no apparent change beyond the color in the uniformity of the sheet. Other sheets again are marked with a chequered pattern in black lines, the lines being due to magnetite. Again there are dendritic inclusions of white quartz between the lamina. All these markings take from the value of the sheets. The most esteemed colors are pure ruby, amber, light green, transparent white. There is also a silver white, which the natives prize for inlaid work.

### LIGHTNING AND ELECTRIC LAMPS.

In a recent issue of "Nature" Mr. Sydney Webb, of Dover, describes in a letter some curious lightning effects he obtained by photograph in October last. He was endeavoring at the time to get photographs of lightning, but owing to the limited horizon available from the position of the camera it was not pointed in the direction where the most numerous flashes occurred It included in its field several of the brush arc lamps used to light the town. In developing a few of the exposures to see whether the photographs of lightning discharges had been obtained, Mr. Webb noticed some peculiar discharges taking place from the Brush arc lamps to the ground. A series of negatives were then taken, including these are lamps in the field, and also of others in which the system of incandescent lamps, which are festooned over the streets of Dover in the season, were shown. Mr. Webb's first impression was that the electric discharges of lightning produce corresponding ones from the lamps, but the number of lines seen on the photographs could not be explained in this way. The photographs were accordingly sent to Sir George Stokes, who gives in "Nature" his views at considerable length. He draws attention to the fact that in the photographs showing the discharge from the arc lamps the path to earth of the supposed secondary charge does not take place through the iron column of the lamp-post, as would be expected. It appears instead striking the ground some considerable distance from the base of the lamp-post. This discharge is also characterized on the plate by a series of dots of lights somewhat similar to the stratification in a vacuum tube. The similarity of the path of discharge from the individual lamp to the earth is excessively curious, and it must also be noticed that in every photo the same similarity is to be seen in the small flashes which take place from lamp to lamp. As regards the stratification which is seen in practically all the lines of discharge, Sir G. Stokes has two suggestions to make. One is that it might have something to do with the way in which the path crossed a series of electromagnetic waves like those of light, except as to the

scale of wave length. Another, which seems more probable, is that they are of the nature of a strong discharge in vacuum tubes. He points out that in an ordinary tube it requires a very good exhaust to get strata 1 in. thick. In the case in point, under atmospheric pressure the strata was a foot or more in thickness. However, with the Geissler tube the strata are closer in the capillary part, where the current is congested, than in the broad part. He suggests that it is possible that the discharges shown in the photographs, which are unconfined laterally, these wide strata are possible with a small density of current. He also remarks that the intensity of the discharges decrease as they go from the lamp to the ground, from which it would seem that the current gradually expends itself in electrifying the air. If this is the case, the long discharges represented in Mr. Webb's photographs may not be so dangerous as some of them look. Sir George Stokes concludes that until more is known of the subject it may be well to avoid standing in the proximity of these overhead lamps during a thunderstorm. As Mr. Sydney Webb points out, the details of these discharges are exceedingly confusing to anyone not acquainted with the relative position of the lamps, and a photograph taken in daylight with the camera in the same position as when the night photographs were taken would be of great value in clearing up what actually happened. It seems to us very unlikely that discharges so exactly similar in path should take place round a number of lamps at a considerable distance apart. The effect could be produced optically, only the size figure apparently made by the discharge on the photographic plate precludes this supposition. -" Electrical Engineer," London.

### Telegraphing by Means of Electric Light.

A patent has been granted to Carl Zickler, of Brunn, Austria, says the "Telegraph Age," on a system of telegraphy by means of electric light. In this method of wireless telegraphy, signals are transmitted by means of rays emitted from an arc lamp, the rays of short wave length (mostly ultra-violet rays) being the ones made use of.

These rays are sent out from the sending station at intervals corresponding to those of telegraphic signals and in the direction of the receiving station, where they produce weak electric waves, by which the signals are made visible as sparks, or are made audible by telephone or electric bell, or, if preferred, may be printed by Morse apparatus.

At the sending station in an apparatus similar to a searchlight projector, having either a reflecting mirror or lens, or both, in combination; if lenses are used, however, they must not be be made of glass, but of rock crystal, in order to allow the ultra-violet rays to pass through them. The pencil of ultra-violet rays from the lens may be interrupted by means of a glass shutter, which is operated by means of a bellows and a pneumatic ball, such as is employed with photographic apparatus. The ultra-violet rays are absorbed by the glass plate, being only emitted when the shutter is removed. By leaving the shutter open for a longer or shorter time, the ultra-violet rays may thus be sent out in a manner to correspond with the dots and dashes of the Morse alphabet.

The receiver consits of a tubular glass vessel closed air tight in front by a quartz plate. Within the vessel are two electrodes one of which has a spherical terminal a few milli-

meters in diameter, and the other a small circular disk so inclined that the pencil of light entering the glass vessel falls upon it and is reflected to the knob of the other electrode. Both electrodes are covered with platinum foil and are separated about ten millimeters. The air in the glass vessel is rarefied to a suitable degree, or the vessel is filled with a rarefied gas.

In front of the quartz plate is a tube fitted with a quartz lens, by means of which the rays coming from the sending station are concentrated upon the circular disk in a small, slightly illuminated spot. The two electrodes are connected with the secondary windings of a small induction coil. When the ultra-violet rays from the sending apparatus fall upon the disk-shaped electrode of the receiver, their luminous electrical effect causes sparking at the induction coil. The opening and shutting at the transmitting station in accordance with Morse signals thus produces at the receiving station a transmission of sparks of shorter or longer duration, according to the signals sent, In this way the signals may be made visible or audible, or recorded.

The most serious objection, however, is the lack of speed, for so far it has been impracticable to arrange transmitters and receivers to accomplish more than eight to twelve words a minute.

### THE ELECTRIC PROCESS OF ANNEALING ARMOR-PLATE IN THE CONSTRUC-TION OF WARSHIPS.\*

BY CHARLES J. DOUGHERTY.

Considering the rapid development and the many applications of electricity in the past few years to the needs and requirements of engineering work, few people realize the important part which it plays in the construction of the latest type of cruisers and battleships armored with harvevized nickel-steel or Kruppsteel plates. A modern battleship is nothing more or less than a floating fortress, its vitals. the machinery, being carefully protected from the enemy's shells by stout and almost impregnable steel plates, ranging in thickness up to 16½ inches. The new type of armor-plate specified for the Alabama is the "harveyized nickel-steel plate."

For those not conversant with the "Harvey process." I will briefly state that it is the introduction of carbon by cementation into the face of an ordinary low carbon-steel plate, and subsequently it is water-hardened similar to an ordinary tool. After this treatment it presents a hard-faced surface to the depth of about one inch, designed to stop and break up projectiles before serious penetration takes place. All armor-plates must necessarily be secured to the frame-work of the vessel in order to hold them rigidly. The plates must be drilled and tapped for this purpose, and herein lies the trouble. The methods heretofore used to produce isolated spots in the plates were principally two-(1) to protect the surface of the plate in patches or strips to prevent carburation wherever holes were expected to be drilled; (2) to make accurate drawings and patterns of each plate beforehand, to which all holes are drilled before the plate is hardened. This plan was practiced by the United States Government for a time, but had to be abandoned because it was found that numerous alterations in construction, errors in the draft-

ing-room or mills made it necessary to pierce the plate where no provision for annealing was made. It was also found feasible to drill and tap holes in the face of the armor-plate at any stage of the process prior to hardening, and without detraction from the plate's resistance; but it is not alway possible to locate these holes with precision without first fitting the plate in place on the ship; this was a very expensive method, and was abandoned in favor of one by which the carbon was prevented from penetrating over certain areas in the wake of the fastenings. This method also had its disadvantages, in that the carbon gases frequently seeped through the protection mentioned, and carbonized the surface beneath, The expedients adopted for preventing the carburation could not always be relied upon, and the great difficulty encountered was to pierce the surface, drill, and tap such a facehardened plate. The first experiments which were made to anneal these face-hardened plates by means of the oxyhydrogen flame and the electric arc were not successful, and the plates resisted most effectually all attempts to anneal the spots which were required to be drilled. Drills of every design and method of tempering were tried, but with no success: the plates could not be drilled by any of the above means. If the plates could not be held in position on the vessel, this meant serious delay in construction. The question of being able to anneal the spots required was becoming a serious matter: but, as many times before in other work of difficult character, the subtile fluid was the only agent that solved the problem, so also in the case of taking the temper out of certain spots to permit the drilling of holes in the harveyized plates, electricity came to our aid on the eve of despair and failure. The Thomson Electric-Welding Company of Lynn, Mass., made some experiments on harveyized plates. and very soon demonstrated their ability to anneal any surface, however hardened, by sending a current of large volume through any spot to be annealed, and by this means raising the temperature of the spot to about 1,000° F.; and at that temperature there can be little doubt that the temper has been withdrawn. This is the process that I wish to treat in this paper.

The apparatus which is necessary to perform the work of annealing these harveyized plates consists of a separately excited alternatingcurrent generator of variable potential, giving a maximum of 300 volts and a current of 100 amperes. The frequency of the generator is fifty cycles per second: the fields are separately excited by a small direct-current exciter of 110 volts and twenty amperes, made by the Thomson Electric-Welding Company, and it is belted to the generator from a pulley on the commutator end of the shaft, and delivers to the field of the generator a maximum current of fifteen amperes at full load. A german silver resistance-box placed close at hand under the control of the operator varies the current in the generator-fields, and thus increases or decreases the alternating electromotive force at the brushes of the generator.

The annealing machine proper is an alternating-current transformer similar to the wellknown welding transformers used in welding steel rails. For those of you who are not conversant with the meaning of the word "transformer" in an electric sense, it will suffice to say that an alternating transformer may be regarded as a species of dynamo, in which neither armature nor field magnets revolve as

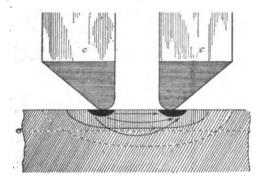

in an ordinary dynamo, but in which the magnetism of the iron circuit is made to vary through rapidly repeated cycles of alterations, by separately exciting it with an alternating current. The primary coil of the transformer corresponds to the field-magnet coil of the dynamo, while the secondary coil of the transformer may be called the armature-coil of the dynamo. In the alternating-current transformer, by whatever name called, the function of the iron core is to carry the magnetic lines of force (that are created by the current in the primary coil) through the convolutions of the secondary coil. The rate at which the magnetic lines due to the primary current are cut by the secondary circuit is the measure of the electromotive force given to the secondary circuit.

With this explanation of a transformer we can understand better the workings of this annealing machine. The transformer is of the copper clad type that is, one in which the secondary is composed of two copper castings, each having a rectangular groove; when bolted together, these form a closed rectangular frame in which the primary coil is held. The hollow space intervening between the primary and secondary is filled with a heavy body oil called "transil oil." This oil acts both as an insulator and a conductor of heat from primary to secondary. The secondary, by completely surrounding the primary, affords an excellent mechanical protection, and prevents electric as well as magnetic leakage. The latter features are quite important, since it is necessary to operate the annealer on board vessels in exposed positions during construction; yet it may be handled with immunity from electric shocks, even when operated in rain or in heavy snow. The primary coil of this transformer consists of a copper ribbon, each turn of the coil being insulated from the next by thin asbestos paper. The ratio of conversion is 100 to 1, and when the maximum voltage of 300 is generated at the brushes of the generator, we have about 2.5 to 2.8 volts at the terminals of the secondary of the transformer. The transformer has two trunions fastened to its sides in a line a little above the center of gravity. These trunions swing in bearingspart of a yoke which straddles the whole. The yoke in its turn has a hook which may be secured at any place of the arch, thus allowing the transformer to be suspended, like a compass in gimbals, in any desired position. The copper castings which compose the secondary circuit are cut through at one place. On either side of the cut two short platforms form the base for a saddle which holds the copper contacts of various shapes and sizes, by means of which the current is made to enter and leave the plate to be annealed. These contacts are made of forged copper of high conductivity, and they are hollowed out to receive a water circulation to keep them cool, and they terminate in a narrow tip which is rounded at the end. The total weight of the annealing transformer is about 1,000 pounds, and this is sufficient to insure proper contact pressure for all work on horizontal plates. When inclined surfaces are to be worked upon, the machine suspended so that its weight shall not interfere with the contact pressure, which is then obtained by bracing the contacts directly with wooden wedges against any object near by. Perhaps the most remarkable thing in the operation of annealing a spot is the great amount of current that is carried by the cop per contacts into the plate. The contact sur

<sup>\*</sup>Read December 16, 1899, and printed in the Proceedings of the Engineers' Club of Philadelphia.

face on the plate is seldom more than about half an inch square, yet 10,000 amperes are made to flow through it during the process of annealing. This current density per contact area is equivalent to 40,000 amperes per square inch, a density which is only rendered possible through the thorough cooling of the copper contacts by a continuous water circulation through them, as I have before mentioned.

In the original experiments made by the Thomson Company in annealing plates, one feature presented itself in the fact that in taking off the heating current when the spot was being annealed caused the heat to be to rapidly conducted away by the surrounding mass of metal that the heated spot became chilled, just as if it had been plunged into cold water. No manner of outside protection of the heated spot would prevent this chilling effect, and it was found that only a gradual and slow withdrawal of the current would produce the complete effect of annealing. The current must

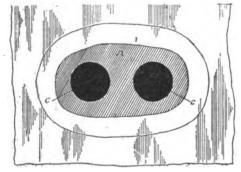

Fig. 1.

Method of introducing the Current into the Plate.

be brought up to the maximum value and then gradually cut down.

The interesting operation of annealing a plate is performed in the following manner: The transformer is placed in position, the contacts touching the plate on either side of the spot marked for annealing. Then the primary current is brought up by means of the rheostat, near at hand, to from eighty-five to ninety-five amperes for a period of from four to five minutes. The metal between the two contact places soon attains a dull red heat, and this temperature is experimentally found by holding a small pine stick in contact with the spot until it takes fire. This is the maximum temperature desired to anneal the spot properly. The current is now gradually diminished by turning the rheostat handle one point each minute until all the resistance is placed in circuit, and by this method the spot is gradually cooled and the chilling of the plate prevented. To illustrate the method of introducing the annealing current into the plate, I shall refer to Fig. 1: C C are the two copper electrodes, the current enters the plate by one end and leaves by the other, as shown by the arrows. Right under the contacts the metal comes to a bright cherry heat, shown in heavy black in the figure, while the portion intervening and partly surrounding the contacts acquires a temperature of just visible red. Line B B indicates where the influence of the Harvey process stops. The shaded portion in the figure shows the zone softened and ready to be drilled, while the dotted line shows how far the heat radiation would cause the metal to turn blue.

The operation of running a heat after the machine is set up takes in the neighborhood of from fifteen to twenty minutes, all depending on the size of the spot to be annealed. On examining the spot after the annealing process is finished, it is found to be a dull chocolate color, the place where the contacts have been resting is scaled and hard, and cannot be touched by a tool to the depth of a quarter of an inch.

In the construction of a modern man-of-war there are many armor-plates which act as shields to the guns. Some of them are circular, others oval. The only method possible to perforate these shields was after carburation and before being water-hardened, up to the discovery of the electric annealing process above described; but to-day, what a change! These plates are cut in various shapes to suit the work by simply annealing a number of spots forming the shape of the hole to be cut, and finally running a cutting tool over the surface thus annealed.

It sometimes happens in the construction of war vessels that the armor-plates have been made up too long to fit in their respective places, and they must have a certain length cut off after their delivery at the shipyard; this occurred several times on plates for the U. S. S. Iowa.

When such cases occur, there are two methods of annealing the plate: First, to lay off on the plate a line of holes side by side directly across the edge which is to be cut off, in the same manner as annealing spots for ordinary drilling—a slow process, indeed, since the annealer must be set for each individual hole. Second, to gradually move the transformer along the line to be annealed, the plate remaining stationary.

It has already been mentioned that it is absolutely necessary that the temperature of any individual spot should be gradually and slowly reduced in order to prevent any chilling. The effect of gradually withdrawing the heat from one spot to any other is accomplished in the second method, by moving the transformer itself, relatively to the plate to be treated, the rate of this movement, of course, depending upon the rate at which the temperature is to fall in any particular spot to prevent chilling. The transformer is arranged to be moved along a line to be annealed, the motion being obtained by an ordinary screw with a handle, the handle being turned at a predetermined rate controlled by a watch, and it was found that the correct speed was about a quarter of an inch per minute to insure positive and thorough annealing. Thus the work can be performed in a short length of time compared to the usual method of setting the machine for individual heats. The copper contacts used can be of the simplest kind; they bed themselves into the surface of the plate, and when dragged along by the screw, raise in front of themselves a clip similar to that produced by a planing tool, and even after a day's continuous moving are found to be intact.

In cases when the transformer is moved relatively to the plate to be treated, as in the method just described, it is a rather startling thing to find a number of steel chips lying

around which have been cut from the plate by the copper contacts; thus developing the peculiar phenomenon of a hard steel chip cut by a soft copper tool.

Besides annealing holes in armor-plate, the transformer may be used for the reversal of the annealing process—namely, for creating isolated hard spots in soft tool steel by sending a current through the spot to be hardened until it reaches a bright cherry heat, and then suddenly removing the current from the machine.

For annealing plates for the U. S. S. Alabama, two complete annealing plants have been at work continuously night and day, Sundays included, for a period of over six months, and upward of about 3,000 holes have been treated.

We have had no difficulty in annealing the harveyized plates of the Alabama, but in this age of advancement something new is constantly being invented; yesterday it was harveyized nickel-steel, and to-day Krupp's armor plates are considered superior to the Harvey or Corey plates. Krupp armor is now being placed upon all the newer vessels of our own and foreign navies.

The Krupp gas-process, as it is called, is a secret, and the rights of manufacture for this country have been purchased by the Carnegie Company of Pittsburg.

The supreme value of the Krupp armor consists in the fact that these plates enable the total weight of armor with which a ship is clothed to be greatly reduced, and the weight so saved may be appropriated to a more powerful armament, or engines and boilers of greater horse-power. Krupp armor shows remarkable toughness combined with all the hardness of the best face-hardened armor; and, unlike armor manufactured by other well-known processes, the Krupp product maintains these qualities in the very thickest armor. thickness of the hardness of Krupp's process is about 1.7 to 2 inches, while the harveyized process goes in about one inch. The new battleship Maine will have Krupp armor; the Russian battleship and cruiser now building at our shipyard will also be protected with it.

Since the Krupp process penetrates into the surface of the plate about two inches, we naturally imagined that it would require a greater length of time to anneal the spots, and after a little experimenting on a sample of this armor we were delightfully surprised to find that the time required to anneal a hole thoroughly was only a trifle longer than that for the harveyized steel plate.

### Important Papers to be Read.

The Southwestern Gas, Electrical and Street Railway Association will hold its next annual convention in Waco, Tex., on April 18, 19 and 20. The following named papers will be presented at the meeting: "Electrolysis," by E. H. Jenkins, of San Antonio, Tex.; "Meters and Incandescent Lamps," by W. R. Ruthell, of Waco, Tex.; "Electricity vs. Gas for Lighting Purposes," by J. F. Cullinan, of Denison, Tex.; "Street Railways of Texas From an Historical Standpoint," by F. E. Scovill, of Austin, Tex.; "The Attitude of Municipal Corporations Towards the Public," by John G. Boyd, of Terrell, Tex.; "Operation and Maintenance of Street Railways," by H. F. Mac-Gregor, of Houston, Tex. Papers on subjects yet to be selected will also be read by E. D. Dysterud, of Monterey, Mexico, and J. C. Lord, of Forth Worth, Tex.

### DEPARTMENT STORE ELECTRIC PLANT.

### BY BURCHAM HARDING.

The question often arises how best to supply electric lighting for a large department store. The electrical equipment for the largest department store in Detroit, that of the Newcombe-Endicott Company, is instructive in many ways. The large store with its several stories faces Woodward avenue, running back to an alley in the rear. Upon the opposite side of this alley is the power house, a one-story building of an unpretentious nature. The original power house, having a floor space of 1,350 square feet, contains a full boiler plant and coal bin, with a steam engine direct connected to a Westinghouse direct current generator.

A duplication of the amount of power for the lighting circuits having become necessary, but the space at disposal being very small and entirely insufficient for another steam driven unit, a small extension was built to the engine room measuring 11 x 18 feet, and in this annex has been installed a 50 horse-power gas engine direct connected to a generator. This addition duplicates the amount of current for the lighting circuits, but less than 200 square feet of floor space is occupied by it, as against 1,350 feet of the other half. In many cases it has been found that a gas engine with a direct connected dynamo is the most satisfactory method when an increase is required to an existing plant.

The gas engine installed in this plant, although nominally of 50 horse power, is frequently called upon for a much heavier load, which it carries with ease. The direct current generator, to which the gas engine is direct connected is rated, at 32½ kw., but the usual load upon it is 340 amperes at 125 volts, supplying 600 lights, and it has been operated up to 376 amperes for 750 lights. Natural gas is used for fuel for the engine, costing 28 cents per 1,000 cubic feet. The gas bill for twenty-six days, running ten hours a day with full load, was \$27.

This installation demonstrates several interesting features respecting gas engines. Among others, that the gas engine possesses as close a regulation as the best automatically governed steam engine. Also that it requires far less floor space in the power house. But perhaps the most important feature is in the cost of fuel. The engineer in charge of this plant states that it costs less to operate the gas engine for a whole day, than the value of the fuel required to start up the steam boiler. Considered solely as a machine for converting the total energy of fuel into mechanical work, the gas engine far surpasses its steam rival. There are gas engines in operation which can transform over 25 per cent. of the heat in the fuel into useful work, while in the very best recorded performance of steam engines barely 14 per cent. of the energy in the coal is accounted for, and in the average steam engine not more than 5 per cent. In small plants, consisting of common slide valve engines, with uneconomical types of boilers, less than 2 per cent. of the energy in the coal burned is converted into mechanical work. The gas engine transforming over 25 per cent. compares very favorably.

Where the service is intermittent, or power is required only for a comparatively short time each day, the gas engine plant has a decided advantage, because it is not, like the steam plant, subject to losses of radiation and leakage when standing idle under full pressure,

and from coal burned to bank fires and in raising steam. With the gas engine the expense of fuel begins and ends with the starting and stopping of the engine. But fuel is only one item of cost in the production of power. Due consideration must be given to the value of the additional space, as mentioned above, and the larger buildings required for a boiler plant, the cost of a stack, the labor of handling coal and ashes, the cost of attendance, oil and water, as well as depreciation, repairs and insurance on the boilers. As regards all these items the gas engine compares favorably with the steam engine.—From the Chattanooga "Tradesman."

### LONDON NOTES.

[From our London Correspondent.]

### Prof Lodge on Contact Electricity.

On February 9, Prof. Oliver Lodge, F.R.S., delivered his presidential address to the Physical Society, taking as his subject, "The Controversy Concerning Volta's Contact Force." He stated that those who take a metallic view of the Volta contact force are accustomed to deny that the Peltier evolution of heat measures the local EMF. existing at a junction.

They assert that it measures the rate at which that same EMF, varies with temperature. In the thermo-dynamic equation connecting the Peltier effect with the variation of E with temperature, the E which varies is not necessarily that at the junction considered, but is the total EMF. of the circuit. The reversible heat at a specified junction is a measure of the metallic EMF. located there. Those who say it is a temperature variation of the EMF, beg the question by locating the whole EMF, of the circuit at the particular junction they are considering, usually an interface of zinc and copper. At a chemical junction the EMF. is not purely thermal, and hence is not measured by the Peltier effect; it is chiefly of chemical origin, and is calculable from the energy of combination of the materials on either side of the boundary. At a metallic junction there is no such chemical potentiality. A strong current may be passed across a zinc-copper junction for years, and no brass is formed. It is therefore improbable that the chemical affinity of zinc for copper is the propelling influence which causes the EMF. located at such a junction. In showing the Volta effect experimentally, a trace of liquid can act detrimentally by form ing a conducting bridge between the plates. across which the bulk of the electricity passes as the metals are being separated. The safest and clearest mode of expressing the Volta effect is that it consists in an opposite charge acquired by dry zinc and copper, while in metallic contact a charge which results from an EMF. of fixed value, and is controlled solely by this EMF. and electrostatic capacity. It is undeniable that the order of the Volta force can be calculated from the differential heats of combination of the metals for oxygen, although it is doubtful whether it can be calculated from the heat of formation of brass. The opposing sides of the old controversy used to be called contact theorists and chemical theorists. Now the opposite sides are involved both in contact and both in chemical views. It is a question of which of several contacts is the effective one, and what kind of chemical action or affinity is the active cause. Is it the contact and chemical affinity across the metal junctions or across the metal air junctions? The opposite sides are thus metallic and dielectric. The metal air force is of the order volts, the metal force is of the order milli-volts.

When a piece of zinc is put in contact with a piece of copper the oxygen atoms which surround these bodies, move slightly away from the copper and approach slightly nearer to the zinc. These slight motions produce the whole Volta effect. All that is necessary for the Volta effect is the inherent film on the surface; all the rest of the gas is mere dielectric and might be substituted by a vacuum.

At the conclusion of Prof. Lodge's address, which by the way would fill a dozen columns of Electricity if published in full, it was arranged to hold a special meeting of the Society to discuss it.

### The Zipernowski-Deri Transformer Patents.

The claim set up by the present owner of the 1885 Zipernowski-Deri patent, for damages, etc., from the London Electric Supply Corporation, and therefore all alternating current stations employing this system of electrical distribution, has failed in the courts. On February 12 Mr. Justice Farwell delivered judgment at great length and dismissed the claim, granting costs on the higher scale to defendants. The hearing of the action occupied nine days, and the judge took time to consider his decision, which we need hardly say is satisfactory in that it prevents one-half of our electrical stations from having to pay heavy royalties for employing this particular arrangement of transformer distribution. The judge declared that he failed to find any "invention" in the arrangement.

### Prof. Hughes's Bequest.

Prof. D. E. Hughes, F.R.S., whose death has been already announced in this journal, has bequeathed \$10,000 to the Institution of Electrical Engineers as a David Hughes Scholarship Fund. The conditions are to be the same as under the Sir David Salamons Scholarship Fund.

### Exports of Electrical Material from New York.

The following are the exports of electrical material and machinery, from the port of New York, for the week ended March 10:

Aberdeen, 204 cases, \$2,573; Antwerp, 150 cases, \$5,885; Barcelona, 4 cases, \$22; Brazil, 137 cases, \$8,445; Bremerhaven, 1 case, \$30; Bristol, 93 cases, \$8,000; British Possessions in Africa, 12 cases, \$1,317, British West Indies, 9 cases, \$289; Central America, 47 cases, \$1,820; Chili, 222 cases, \$2,401; China, 34 cases, \$556; Genoa, 33 cases, \$2,097; Glasgow, 4 cases, \$190; Hamburg, 49 cases, \$7,521; Havre, 332 cases, \$9,279; Hull, 6 cases, \$417; Japan, 12 cases, \$180; Liverpool, 23 cases, \$902; London, 182 cases, \$8,347; Marseilles, 34 cases, \$2,755.

### Chicago Electrical Association.

The next meeting of the Chicago Electrical Association will be held at Room 1741, Monadnock Building, Chicago, at 8 P. M. on March 16. Mr. F. N. Boyer will read an address on "Arc Lighting."

### Proposals Invited.

The Interior Department is inviting sealed proposals until April 5 for furnishing the necessary materials and labor required to install an electric lighting system at the Flandreau Indian School, South Dakota. Full information can be obtained upon application to the superintendent of the school at Flandreau.

### LEGAL NOTES.

Supreme Court Justice Smith last week filed a decision at White Plains, N. Y., holding that the New York, Westchester & Connecticut Traction Company and the North Mount Vernon Railway Company had no right to lay tracks within the village of Eastchester and ordering that the tracks already laid on the White Plains road in Bronxville must be removed at the company's expense. An injunction is granted restraining the construction of the road, and a judgment for damages levied against the corporations.

James A. C. Johnson has been appointed receiver of the New York Electrical Works at No. 515 Kent avenue, Brooklyn, N. Y., by the Supreme Court in proceedings brought for the voluntary dissolution of the company.

### Recent Important Decision.

The suit brought against the Edison Electrical Illuminating Company of Baltimore City by Philip A. Brown was recently decided by the Maryland Court of Appeals.

Brown was a boy of eleven years of age and was employed by a person who was the proprietor of a store. The electric light current was introduced into the store by two primary wires, extending from a pole standing some seventy five feet east of the building to glass insulators which were attached by iron brackets about six inches long to the eastern-most end of the small roof of the store. From the insulators the wires passed into a fuse box and then into a converter from which the current was carried by secondary wires into the store. The primary wires from the pole to the converter were charged with a current of 1,000 volts, but the secondary wires extending from the converter into the store were only charged with the comparatively harmless current of 50 volts. The primary wire from the pole to the insulator nearest the house, and not more than six inches from it, was joined beyond the insulator, and the point of the joined wire was left sticking up and entirely uncovered. The same wire was exposed naked by reason of defective insulation at two other places about two or three inches beyond the insulator. Brown had been sent upon the roof to clean the gutter and water spout, and shortly afterwards he was found lying insensible upon the roof with his head in contact with the exposed joint in the primary wire.

The Baltimore Court of Common Pleas rendered judgment for the defendant from which the plaintiff appealed. In reversing this judgment the Appellate Court said: "Outside of any contractual relation between the parties in this suit the very nature of the business thus conducted by the defendant imposed upon it a legal duty towards every person who, in the exercise of a lawful occupation, in a place where he has a legal right to be, was liable to come in contact with the wires charged with this invisible but deadly power. This duty has been enforced by the courts in many cases in this State and elsewhere. As applied to the management by the defendant of its wires charged with the high tension current, this legal duty would require it to see that its wires, when strung where persons were liable to come in contact with them, were properly placed with reference to the safety of such persons and were properly insulated, "-(45 Atl. R. 182.)

West Union, O -The West Union Electric Light Company will erect a new electric light plant here.

### PERSONAL MENTION.

Mr. George F. Porter, sales manager for Kerite wires and cables, and Mr. Elmer P. Morris, representing electrical supply houses, are visiting Havana, Cuba.

Mr. A. W. Shoemaker has been appointed general manager of the La Bella Electric Power Company at Denver, Col., in place of J. E. Bell, who recently resigned.

Dr. Frederic A. C. Perrine of Trenton, N. J., was recently elected president of the Stanley Manufacturing Company of Pittsfield, Mass. Dr. Perrine is an expert in electrical matters. He has for years been a keen student of electrical development, and as a professor of electrical engineering in the Leland Stanford University won the reputation of being one of the brightest minds in the Western electrical would.

Mr. William H. Spaulding, formerly of Clinton, Mass is now superintendent of the Westerly (R. I.) Gas & Electric Light Company's plant,

Mr. E. M. Addls has resigned the position he held in New York and is now superintendent of the Spring Valley Electric Illuminating Company. He served in the same capacity before going to New York.

Mr. Thomas A. McLoughlin of the General Electric Company, who has been located in London for the past eight months, will return to America this month. Mr. McLoughlin's headquarters will be in New York City,

#### INCORPORATIONS.

The New Mexico Light, Heat & Power Company, Pueblo, Col.-to furnish light, heat and power. Capital stock, \$30,-000. Incorporators: E. S. Woods, F. L. Guddeback and H. E. Currie, all of Pueblo.

The Williamson Electric Light & Power Company, Williamson, Va.-to build an electric light plant. Capital stock, \$50,-0.00. Incorporators: C. H. Jones and T. B. Gerner.

The Mt. Whitney Power Company, Visalia, Cal.-to manufacture, generate and produce electricity, electric power, etc. Capital stock, \$300,000, Incorporators: W. H. Hammond, A. G. Wisbron, R. P. Hammond, B. M. Maddox and S. Mitchell, all of Visalia.

The St. Joseph & Elkhart Power Company, Mishawaka, Ind. Capital stock, \$50,000. Directors: E. A. Saunders, James DuShane, J. C. Eberhart, C. H. Tenney and Fred P. Dalafield.

The Murray Electric Light & Power Company, Monticello, N. Y. Capital stock, \$20,000. Directors: Peter C. Murray, Delia Murray and E. S. Rockefeller, all of Monticello.

The Seth W. Fuller Company, Boston, Mass.-to buy and sell electrical goods, etc. Capital stock, \$20,000. Incorporators: I. R. Clark, A. W. Leonard and C. E. Stratton.

The American Electric Switch Company, Pittsburg, Pa. Capital stock, \$20,000. Directors: John H. Spangler, Charles Sohn and Ernest Gawthrop.

The Electric Light, Heat & Power Company, Hammonton, N. J. to furnish electric light, etc. Capital stock, \$25,000. Incorporators: F. J. Thorn, Edgewater Park: G. E. Brett, Philadelphia, and C. C. Gallagher, Beverly,

The Five-Mile Beach Light, Heat & Power Company, Wildwood. Pa.-to furnish electric light, heat, etc. Capital stock, \$100,000. Incorporators: H. H. Ottens, Wildwood: S. W. Fleming and G. Moffatt, both of Philadelphia, Pa.; H. S. Douglass, attorney.

The Buffalo Electric Carriage Company, Buffalo, N. Y. Capital stock, \$20,000. Directors: Frank A. Babcock and Isidore Michael of Buffalo.

The United Electric Gas & Power Company, Los Angeles, Cal. Capital stock, \$650,000. Directors: H. V. Carter, Frederick H. Rindge, Alfred Stedman, George I. Cochran and J. J. Davis.

The Buffalo Electro-Surgical Instrument Company, Buffalo, N. Y. Capital stock, \$9,000. Directors: Becker, E. C. Lapham and Charles Taylor, all of Buffalo.

The Ida Grove Electric Company, Ida Grove, Ia.-to do an electric business. Capital stock, \$30,000. Incorporators: J. W. Reed and F. A. Lusk, both of Ida Grove.

### ELECTRICAL PATENT RECORD.

{ This department is edited by OSCAR A MICHEL, Solicitor and Attorney for AMERICAN AND FORFIGN PATENTS, at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington. D C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway,

New York City, N. Y., or 639 F street, N.W., Washington, D. C. Copies of any patent published can be furnished upon p ment of ten cents. When ordering give name, date and title of invention wanted.

### LETTERS PATENT ISSUED MARCH 6, 1900.

### ELECTRIC RAILWAYS AND APPLIANCES.

644,596. Car-Fender. Domenico Guarino, New York City, Filed July 5, 1899.
 644,639. Electric Railway Signal. Judson Shoecraft, Topeka.

Kan.

346. Insulator for Use on Electric Railways. James Thomas and William R. Thomas, Catasauqua, Pa. Filed

Thomas and William R. Thomas, Catasauqua, Pa. Filed Dec. 12, 1899. 015. Electric Railway. Warren B. Reed and Lyman C. Reed, New Orleans, La., Filed Oct. 16, 1899. 021. Underground Electric Railway. George W. Smith, Dallas, Tex. Filed Aug. 23, 1899.

### ELECTRIC LIGHTS AND APPLIANCES.

ELECTRIC LIGHTS AND APPLIANCES,
644,562 644,563. Electric-Arc Lamp. Thomas E. Adams,
Cleveland, O. Filed Ang. 16, 1899, Sept. 20, 1899.
644,783 644,784-644,785. Electric Glow-Lamp. John Van
Vleck, New York City. assignor to Christopher D.
Smithers, same place. Filed May 9, 1899, June 8, 1899.
644,816. Electric-Arc Lamp. William J. Davy. London,
England, assignor of one-half to Charles Williamson
Milne, same place. Filed May 25, 1899.
644,823. Electric Lamp for Bicycles. Gustavos Heidel. St.
Louis, Mo., assignor to the Globe Electric Company,
same place. Filed Jan. 9, 1899.
644,992. Electric-Arc Lamp. Edward M. Barnes, Cleveland, O., assignor to Arthur L. Garford, Elyria, O. Filed
April 10, 1899.
644,995 645,041, Vacuum-Tube Lighting. Daniel M. Moore,
Newark, N. J., assignor to the Moore Electrical Company,
New York City. Filed Nov. 9, 1899, July 27, 1899.

### ELECTRICAL MACHINERY AND APPARATUS.

ELECTRICAL MACHINERY AND APPARATUS,
644,666 Controller for Electric Motors, Maxwell W. Day,
Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 17, 1898.
644,684. Dynamo-Electric Machine. Henry G. Reist, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Oct. 27, 1899.
644,745. Electric Switch. Norman Marshall, Newton, Mass., assignor to the Marshall Sanders Company, Boston, Mass.
Filed April 25, 1899.

### GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Alliance, O.—This city will erect a municipal electric light plant for public and private use, to cost \$35,000.

Alton, Ill.—The Alton Electric Light Company will receive bids for an electric light plant to cost \$20,000.

Amarillo, Tex.—An electric light plant will soon be

Americus, Ga.—The city council has granted a franchise to an electric light and power company to build an electric light plant here.

Batavia, O.—Bids will be received until March 27 for erecting an electric light plant to supply 40 arc lights, to cost about \$30,000.

Boonville, Mo.—The city council is discussing the question of building an electric light plant.

Cayuga, Ill.—This village is preparing to erect an electric light plant.

Dayton, O.—The board of city affairs have completed the specifications under which bids will be received for lighting the city by means of electricity and incan-descent gas. The bids will be opened March 29.

Decatur, Ill.—The business men of this city are about to establish an independent electric lighting plant.

Durham, N. C.-The Durham Electric Light Company is preparing to rebuild its electric light plant which was recently burned. The new plant will cost

Kenton, O—At the April election the question of issuing \$20,000 in bonds to build an electric tight plant, to be operated and owned by the city, will be submitted

Laurel, Md.—A bill has been introduced in the Legislature providing for a bond issue of \$10,000 for the purchase or construction of an electric light plant.

Leadville, Col.—The Leadville Electric Light Company proposes to enlarge its plant. About \$100,000 will be expended in making improvements.

Merchantville, Pa.—The Merchantville Light, Heat & Power Company, which recently accepted the ordinances passed by the council, will shortly erect a new plant both for production of gas and electricity.

Minot, N. D.—This town will erect an electric light plant this spring.

New Lisbon, Wis.—The New Lisbon Advancement Company contemplates the erection of an electric light plant. W. H. Cash, president.

New Haven, Conn.—Petitions are in circulation here asking the board of warden and burgesses to light the borough with electricity instead of the naphtha lamps now in use.

Norfolk, Va.—On March 6 the Norfolk Heat & Power Company filed a bond in \$10,000 binding themselves to egin the erection of an electric light plant within four

Onsway, Mich.—The citizens of this place are discussing the question of erecting an electric light plant.

Polwin, Kan.—The electric light plant of this city will soon be increased by the addition of another dynamo.

Rutherford, Tenn.—A company has been formed here for the purpose of putting in an electric light plant.

Safford, Ariz.-A new electric light plant is to be erected here.

erected here.

Slatington, Pa.—The Citizens' Electric Light & Power Company's plant at this place has been leased to the Allentown & Slatington Trolley Company for a period of thirty years with the privilege of buying the same at a certain figure. A new and much larger plant will be erected further down along the canal, which will be quipped to furnish the power to run the electric cars, light and other power for the town.

Gouth Pand Ind.—A 13 ft. dam. 1 200 ft. long, will

South Bend, Ind .- A 13 ft. dam, 1,200 ft. long, will be built in the St. Joseph River and will furnish water sufficient for an electric light plant of 10,000 horsepower, which will be built as soon as the water power is available.

St. Paul, Minn.—City Engineer Claussen has a scheme for the city to own its electric light plant, and will submit a report on the subject to the conference committee at the next meeting. The new plant will cost \$250,000.

Swainsboro, Ga -An electric light plant will soon be erected at this place.

Uxbridge, Mass.—The Uxbridge & Northbridge Electric Light Company has decided to build its new plant in this city.

Yonkers, N. Y.-Last week the committee on lamps reported in favor of an act to be submitted to the Leg-islature authorizing the common council to establish a municipal electric light plant at a cost not to exceed \$175,000.

Wadesborough, N. C.—Sealed proposals will be received by the commissioners of this town until 3 P. M., Thursday, March 22, for constructing a system of waterworks and electric lights. Plans and specifications, forms, etc., may be obtained from the engineer or town

clerk. Address W. P. Parsons, clerk and treasurer. Wadesborough, N.C., or Henry E. Knox, Jr., engineer, Charlotte, N.C.

### STREET RAILWAYS.

Afton, N. Y.—A proposition to connect this village with Deposit by an electric railway has been indorsed by residents of both villages. It is understood that people living along the proposed line would willingly render what assistance they could toward furthering the project.

Albion, Mich.—F. N. Rowley, representing the Kalamazoo Valley Electric Street Railway Company, has applied to this city for an electric railway franchise.

Battle Creek, Mich.—This city is to be the terminus of another interurban electric railway. Parties have secured the right of way for a line running south to Burlington, Union City and to Coldwater.

Cadiz, O.—Harrison county has granted to J. A. hite the franchise for an electric railroad connecting White the franchise for a Wheeling and this city.

Cincinnati, O.—Homer Morris of this city is promoting the interests for an electric line between here and Richmond, Ind.

Harrisburg, O.—Efforts are being made by the Grove City electric line to extend its lines to this city, a distance of seven miles southwest of the southern terminus of the road at Grove City

Indianapolis, Ind.—The building of electric lines in this State promises soon to connect this city and Colum-bus, O, and take in D syton on the interurban route between the two capitals.

Lima, O -Representatives of the Cleveland Traction Company are figuring on building an electric line from this city to Wapakoneta, thence to St. Mary's, then to Minster, and from there to Piqua.

Los Angeles, Cal.—The Temple street cable road in this city is soon to be run by electricity. Marietta, O—The Central Ohio Electric Street Rail-

road Company has asked the county commissioners to grant a franchise for a suburban line from this city to Parkersburg on the Ohio side of the river.

Metamora, Mich.—Simmons & Curry of Datroit are after franchises for an electric road connecting Oxford, Thomas, Metamora, Hunter's Creek, Lapeer, North Branch and Clifford, to be known as the Oxford, Lapeer & North Branch Railway. Influential persons at this point have been asked to co-operate and a public meeting will be held meeting will be held.

Pitisburg, Pa.—The West End Traction Company contemplates the construction of a branch line to the works of the American Steel & Wire Company on Neville Island. The line will be used for the transportation of building material for the big blast furnaces and wire mills now in course of erection.

Richmond, Ind.—The Richmond city council has granted a franchise to the company backed by F. Wesson, of New York, for an electric line to connect this city with Eaton, O.

Riverton, N. J.—The borough council has granted a franchise to the Delaware River Trolley Company to lay its tracks through the borough. This company now right of way from Trenton to this place

Sumpter, Ore.—An electric railway through the streets of this city to all the outlying and semi-urban additions; an eight mile trolley line from here to Bourne, and finally an electric railway 20 miles long. from Sumpter to Granite, are now among the assured facts for 1900.

Wabash, Ind.—F. L. Boyd, a New Haven, Conn., electric car builder, is trying to secure the right of way for an electric railway line connecting Wabash and

Waukegan, Ill.—Eastern capitalists, represented by W. F. Dimmick, of Chicago, who are planning to build an electric railway from Waukegan to Fox Lake, Ill., will also build a line from Waukegan to Kenosha if favorable arrangements can be made.

### COMPANY MATTERS.

Alton, Ill.-The Alton Railway, Gas & Electric Company will spend \$50,000 in dynamos, etc., and a like amount in other improvements.

Boston, Mass.—A short time ago the Lynn & Boston Railroad obtained control of the Wakefield and Stone-ham and Salem and Gloucester Electric Railroads. The headquarters of the system will be at Lynn, and the entire road from Scollary Square to Cape Ann, and from Lynn to Woburn and Billerica will be controlled from the offices in that city.

Cameron, Tex.—The Goldthwaite Brothers have sold their electric light plant to the Cameron Water, Light & Power Company, and the latter will move the dynamo to the river and the power will be furnished there in connection with the pumping of the water to the standpipe The company will take possession the 15th of May and are now putting in poles to the river to place the wireson.

Cleveland. O—The barns of the Cleveland, Berea, Elyria and Operlin Electric Railroad, west of this city, were destroyed by fire recently. About a dozen cars were also burned. Loss \$60,000.

Hartford, Conn.—It is planned by the Holyoke Water Power Company to spend several thousand dol-

lars the coming summer in improvements to the dam

New York.—H. H. Vreeland president of the Metropolitan Street Railway Company has submitted a special report to the executive committee of the board special report to the executive committee of the board of directors concerning the contemplated improvements in the construction and operation of the company's lines during the present year, which will cost between \$8,000,000 and \$10,000,000. Among the most important changes will be the substitution of electricity for cable on Broadway, Columbus and Lexington avenues. Electricity will also be installed in place of horse power on the line between 6.h and 8th avenue and the Christopher streat ferry. pher street ferry.

Philadelphia.—At a recent fire in this city the building in Cherry street occupied by the Philadelphia Electrical Equipment Company was totally destroyed, entailing a heavy loss.

Troy, N. Y.—The Taylor Electric Truck Company will during the present month remove its plant from this city to Colonie, where it has purchased about four and one quarter acres of land. The company supplies trucks for the principal electric railway corporations throughout the United States and Canada. Becently it has a state of the principal electric railway corporations. it has entered foreign fields, and has in view large con-tracts in Scotland and other parts of Europe.

Wilmington, Del.—The Delaware Electric & Supply Company has received a contract from the Delaware Paint Company of Newport, for one fifty-pound horse power engine with a 100-pound boiler.

#### MANUFACTURING.

Braidentown, Fla.—The Lyle Manufacturing Company, lately incorporated, will build an electric plant at this place.

Newark, N. J.—The Automobile Dry Accumulator Company, recently incorporated, will manufacture all kinds of electric batteries and dry electric accumulators. The company is capitalized at \$100,000.

### POWER AND TRANSMISSION PLANTS.

Asheville, N. C.—There is a project on foot for the development of electric power on the French Broad River. A corporation, to be called the W. T. Weaver Power Company, has been formed, the incorporators and stockholders being W. T. Weaver, Gen. T. F. Davidson, James L. Wagner, T. W. Raoul, J. H. Lougie and A. B. Williamson. The old Vance property, five miles below here, has been purchased, consisting of 200 acres. The electricity will be sold in this city, and 1,100 horse power will be developed. Work will begin at an early date. The dam will be 6 feet high, the canal 1,250 feet long, with a head of 14 feet, capable of supplying 54,000 cubic feet of water per minute. Locknort. N. Y.—Many of the manufacturing con-

supplying 54,000 cubic feet of water per minute.

Lockport, N. Y—Many of the manufacturing concerns of this city are operating by electric power and there is a demand for more power which cannot at the present time be met. The incorporation of the Newfane Pewer Company in Albany recently and the operations to dam Eighteen Mile Creek for power purposes are being watched here with interest. The dam is to be 50 feet high and will make it possible to generate an immense amount of power. The proposed Olcott electric railway extension will be operated from the new power plant and there will be a large surplus to sell in this city. this city.

Snoqualmie, Wash.—The Snoqualmie Falls Power Company proposes to enlarge its plant so that it will produce at least 20,000 horse power daily. The company is capitalized at \$600,000 and it supplies power to Seattle, Tacoma and Everett.

### MINES.

Bear Creek, Col.—Col. C. H. Nix is at work on an electric plant here. It is estimated that this plant will generate not less than 20,000 horse power. It will not only furnish light and power to most of the mines about Ouray which do not have their own electric plants, and light for the city of Ouray, but the motive power for the new electric road which Otto Mears proposes to construct on the line of his old toll road from Ouray to Ironton. road from Ouray to Ironton.

### AUTOMOBILES.

New York.—A run up into Westchester County is being arranged by the Automobile Club of America for this month, probably about the 20th, if the roads are in a fit condition. Starting from the Waldorf-Astoria the run will be to Tarrytown, then across Westchester County to Port Chester, and thence back to New York. The route covered will be from 70 to 75 miles, the longest run attempted by the club. It will afford an excellent preliminary test for the longer run to Philadelphia, in April. run to Philadelphia, in April.

run to Philadelphia, in April.

Washington, D. C.—Several plans are in contemplation for the establishment in this city of a public service of electric vehicles over designated streets. The vehicles will hold about fifteen passengers. A local company is being formed for the purpose of operating a vehicle of this kind, the invention of a Washington man, now being manufactured for the purpose. It is understood a concern which already has a plant in this city for the care of electric vehicles, and where the batteries can be renewed, proposes to place conveyances for public service on the streets, and it is said arrangements have been made for transfer privileges with one of the street car companies.

# THE TELEPHONE WORLD.

#### A Serious Blow to the Bell.

Regarding the acquiring of the Erie Telephone & Telegraph Company by the Telephone, Telegraph & Cable Company of America the N. Y. "Commercial "says:

"Various interpretations are placed by Wall Street upon the purchase of the Erie Telephone & Telegraph Company by the Telephone, Telegraph & Cable Company of America, but it is generally conceded that the acquisition of the Erie will prove a serious blow to the Bell Company. None of the officials of the Bell Telephone Company would discuss the matter. They were apparently much disturbed by the turn things had taken, and have not yet had a chance to prepare against further hostilities on the part of their young and vigorous rival.

"It is conceded that the Telephone. Telegraph & Cable Company will now have no difficulty in extending its lines throughout the territory east of the Mississippi. It is reported that the independent company paid \$110 a share for a controlling interest in the \$10,000,000 stock of the Erie. The former will offer to take up all of the Erie shares with a 5 per cent, bond secured by the Erie stock.

cent. bond secured by the Erie stock.

"The great resources of the Telephone, Telegraph & Cable Company may be judged by the fact that its capital is \$30,000,000, and there is no difficulty in disposing of it as rapidly as funds are needed.

"Many persons believe that the Western Union Telegraph Company is back of the independent telephone company, but assurances have been given by directors of both companies that there is no foundation for this report. The Western Union owns \$5,000,000 of the stock of the New York Telephone Company, and is also interested in other companies controlled by the Bell Company.

"One thing seems certain. Both of the telegraph companies are jealously watching developments in the telephone world, and they are prepared to take sides at once if they see their interests threatened. The telephone companies are encroaching more and more on the telegraph companies, and the latter will scon have to do something to protect themselves."

### Nickel in the Slot Telephones for St. Joseph, Mo.

The Missouri & Kansas Telephone Company is about to introduce a meter telephone service in St. Joseph, Mo. The system is intended for use in residences, where an instrument is called into service only a few times during a day.

To use the instrument the receiver is removed from its hook and the bell-crank turted. This calls central. When connection with the desired number is secured the user of the line is told by central to "register," which he does by dropping a nickel into a metal box, and pushing a lever on the front of the receptacle. That completes the transaction and the line is in use. No charge is made for in-calls, the subscriber paying only for the calls he makes. The new service will be on the party line system, a number of instruments being placed on each line, the subscriber for whom a call is intended being indicated by the number of rings given in calling in. The new service has been in successful use in Eastern cities for some time, and was given its first trial in the West a few weeks ago, when the Kansas City exchange was equipped with it.

The New England Telephone & Telegraph Company laid their new cable across Vineyard Sound recently from a point near Nobska lighthouse to West Chop, a distance of four and one-half miles. The work was done by the Western Union cable boat. It is a submarine, six conductor cable, and can be used for both telephone and telegraph service, although its immediate use will be that of connecting Martha's Vineyard with the main land by long distance telephone. The exact location of the cable, as it was laid across the Sound, was taken by Government coast surveyors, with a view of its being properly advertised, thereby lessening the liability of its being caught up and broken by vessels anchoring near it.

The Hudson River Telephone Company had its annual meeting at Albany, N. Y., on the 1st inst. It was decided by a unanimous vote to increase the capital stock from two to three million dollars, the new stock to be disposed of that money could be had for enlargements and betterments.

Arrangements are in progress for the purchase of the Maryland, Pennsylvania and West Virginia Telephone Company, the Greensburg Telephone Company and the Home Telephone Electric Company by the Telephone, Telegraph & Cable Company of America.

The Bell Telephone Company has decided to build a line from Cortland to Burghill, Kinsman, Bristolville and West Farmington, Ohio, at a cost of \$40,000.

The Fairbury Telephone Company of Fairbury, Neb., has increased its capital stock to \$10,000 and will at once put in toll lines to the other towns in the county.

### The People's Telephone Company of Wilkes-Barre, Pa.

Considering the magnitude of the work performed, the People's Telephone Company of Wilkes-Barre, Pa., has in a remarkably brief period built up a telephone system that has but few, if any, superiors among the independent lines of the country. But the work of construction has not yet been completed and a true estimate of the system's value cannot be given before all of the suburban towns are connected, and then Wilkes-Barre will have a service second to none.

Almost \$200,000 has already been expended, but there will be a much greater outlay before the work contemplated by those behind the enterprise has reached the point laid down in the original plans. Exchanges are now in operation in Wilkes-Barre, Nanticoke, Pittston and Kingston, and before long Plymouth will be included in the list. The intention is to begin work on the trunk lines very shortly. This part of the work will take about two weeks and then the entire valley will be connected. The work, however, will not stop here, as a franchise at Scranton has been secured by an independent company, which will have connection with the system in Wilkes-Barre and when the construction is completed in Scranton the People's subscribers will have service between Wilkes-Barre and Carbondale, where there is now an independent company. To complete this circuit it will probably take until next October.

### Telephone War in Iowa.

A new independent telephone movement has been commenced in Iowa, where the Iowa Bell Company is now operating. Among the companies which were absorbed by the Bell Company was the Ottumwa Telephone Company which controlled over 150 miles of wire. New companies are being organized to take the place of those companies which have been absorbed by the Bell Company.

The Union Telephone Company of Fort Scott, Kan., operating long distance lines over southeast Kansas, has brought suit to enjoin the Mutual Telephone Company. owning the largest local exchange in Fort Scott, from disposing of seventy-three shares of unissued stock and to compel the Mutual Company by mandamus to issue the stock to it. The Union Company is composed of a minority of the Mutual Company stockholders, and when it was learned that it was seeking to get control of the stock at \$55 per share the stock jumped to \$125 per share, which the Mutual Company claims to have refused for the plant.

The Union Company offered the market value for the unissued stock and tendered \$4,000 in gold in payment for it. The Mutual Company refused to issue it and the suit is to compel it to do so. Both companies are paying big dividends. The Union Company seeks to get possession of the Mutual Company's plant, to operate it in connection with its long distance lines.

The Hopewell Telephone Company of Hopewell, N. J., held its annual meeting on the 1st inst., when the following officers were elected: President, John N. Race: vice-president, Dr. T. A. Pierson; secretary, C. E. Voorhees: treasurer, Theo. M. Hall; directors: John N. Race, F. F. Holcombe, C. E. Voorhees, D. L. Blackwell, William H. Slugg, J. Mason Ege, Geo. E. Pierson, Dr. T. A. Pierson, Theo. M. Hall; manager, Jonas B. Sutphin. Nearly fifty telephones are now in service in that borough.

The Long Distance Telephone Company has begun putting in a line from Grand Forks to Larimore, N. Dak. This circuit will be extended in the summer, in all probability, and it is thought that it will find its eastern terminus at Devil's Lake. The next work to be taken up by the company will be the construction of a line from Crookston to St. Vincent, and this will make a belt line from Grand Forks that will traverse a rich section of the country as follows: From Grand Forks to Grafton, thence to Bathgate, Pembina, St. Vincent to Crookston and back. A number of other lines are also projected.

Seventy-five per cent. of the capital stock of the New York & New Jersey Telephone Company of Brooklyn was represented at the annual meeting and election of officers recently held at 81 Wilioughby street, Brooklyn. There was but slight opposition to the re-election of the old board of directors and inspectors as follows: Charles F. Cutler, Alexander Cameron, Joseph P. Davis, Charles A. Nichols, Hugh Kinnard, Wilham D. Sargent, David B. Powell, George H. Prentiss, Felix Campbell, Edward J. Hall, H. Sanger Snow, Zenas Crane.

A dispatch from Bristol, Tenn., to the N. Y. "Commercial" states that the Postal Telegraph Company has tested the telephone wires of the East Tennessee Telephone Company and found that they can be made to do the double duty of transmitting telephone and telegraph messages.

### Telephone Relief för Washington.

At one time the sentiment of the people of Washington, D. C., was decidedly adverse to the proposition of solving the telephone rate trouble by incorporating a rival company. It was felt that better results could be secured by the regulation of the rates charged by the established company, and that the reform was not worth the trouble of tearing up the streets for a duplicate set of conduits. Now that the effort to regulate the rates of the old company has been thwarted by a court decision, however, and the demand for lower rates is even more insistent than ever, the sentiment of the people has undergone a change and favors the alternate remedy of a new company. The District committee of the House has decided to report favorably one of the pending bills to this end, and it is announced that it will be taken up by the House at the next District day. Whatever company is chartered, provided it is surrounded by safeguards and requirements calculated to insure good service, the people will welcome the prospect of relief from the burden under which they have labored for years. Prompt action by the House will pave the way to similar action by the Senate at this session.

### Hear a Sermon Through the Telephone.

ELKHART, Ind., March 11.—The telephone as an agent of Christianity was given a practical test here this forenoon when fifty persons heard through a telephone in their homes a sermon delivered at the First Presbyt rian Church by the Rev. Dr. F. H. Gwynne. The feat was accomplished through the use of an extremely sensitive transmitter just invented by G. H. Fister and Herbert Row of the Home Telephone Company. This transmitter was fixed on the pulpit. Twenty connections were made at a time and one was with the residence of a citizen of Goshen, ten miles distant. The only other public test of the invention was on last Tuesday, when the addresses before the Republican Congressional Convention was transmitted to towns forty miles away. The inventors are working on a receiver which will be so loud that it need not be placed to the ear.

The stockholders of the New Telephone Company of Indianapolis, Ind., on the 9th inst. re-elected the old board of directors and the following officers: A. H. Nordyke, president; Simon P. Sherin, vice-president and general manager; H. B. Gates, secretary, and M. B. Wilson treasurer. The company has 4,000 'phones in use.

At a recent hearing before the Massachusetts Legislative Committee on Mercantile Affairs, S. L. Powers, counsel for the New England Telephone Company, caused a sensation by receding from his former position and expressing himself as in favor of State supervision of telephone companies provided the committee considered that to be the best policy.

The co-operative telephone companies, organizing in the rural communities of Western Indiana, are proving successful, and are rapidly multiplying. The companies have connection with each other, but a small tax is levied on their communicating with patrons of other companies.

A telephone line is being built between Belmont, Spottsylvania County, Va., and Tinders Station, on the Piedmont, Fredericksburg & Potomac Railroad, to connect with the Fredericksburg and Orange telephone line.

The Citizens' Telephone Company of Columbia, Tenn., is now connected with the lines of the Lawrence County Telephone Construction Company. The stockholders will hold a meeting on March 15.

Tyndall, S. D., will have in all probability in the near future a telephone system, as steps looking to the construction of a plant are being taken by the business men of that locality

Danbury, Ia., will vote March 26 on the proposition of approving the franchise granted to the Odebolt Telephone Company by the town council.

Preliminary steps are being taken looking to the organization of a company to construct and maintain a telephone system in Canastota,  $N, Y_\star$ 

### TELEPHONE INCORPORATIONS.

The Mifflin & Widowville Telephone Company, Mifflin, O. Capital stock, \$1,000.

The Antwerp Telephone Company, Antwerp, O. Capital stock, \$10,000.

The Gould Telephone Company, Wilmington, Del. Capital stock, \$100,000. Incorporators: E. M. Valentine, C. C. Gould, F. Wister, all of Philadelphia.

The Rockford, Telephone Company, Rockford, O. Capital stock, \$10,000.

### SECURITIES. **ECTRICAL**

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electrical Securities dealt in at the leading commercial centers are compiled from special reports. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. ### NOTES FOR INVESTORS.

Late quotations for copper are: [Electrolytic, 153@16c.; Lake, 164@16½2.; casting, 15½@15¾c.

The Canadian General Electric Company is applying for letters patent increasing its capital from \$1,200,000 to \$1,500,000.

The United Electric Company is said to be negotiating for the absorption of sixteen lighting companies in Northern New Jersey.

The Commercial Cable Company has declared a quarterly dividend of 12 per cent., payable April 14. Books close March 2) and reopen April 3.

The Cauto River Company, with a capital of \$1,000,000, to operate an electric plant in the West Indian Islands, has been incorporated at Trenton, N. J.

Application has been made to the New York Stock Exchange to list \$5,000,000 additional common stock of the Eric Telephone and Telegraph Company.

The Telephone. Telegraph & Cable Company of America has called for a third payment of 5 per cent., or \$2 50 per share, payable May 1. Par value is \$50.

A dispatch from Tacoma, Wash., states that the Canadian Government will build a 1,000 mile telegraph line connecting the Syaguay-Dawson line at Tagish

The Ridgefield and Teaneck Railroad has been merged with the Bergen County, J.) Traction Company, which operates between Fort Lee Ferry, Englewood and Hackensack, N. J.

The National Power and Manufacturing Company was incorporated in Tren-N. J., on the 8th inst., with a capital of \$2,000,000 to manufacture and sell light, heat and power.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Bat, 15@15; New York Electric Vehicle Transportation, 74@71; New England Transportation, 5@6.

A franchise tax bill has been introduced in the New Jersey Assembly. It imposes upon all persons, companies and corporations operating municipal franchises a tax of 2 per cent. on their gross receipts in addition to the tax to be paid upon tangible property.

Fifteen hundred employes of the St. Louis Transit Company have decided to strike unless their demands are complied with that there shall be no further discharge of motormen and conductors because of their affiliations with the Amalgamated Association of Street Railway Employes.

The report of the National Carbon Company for the year ended Jan. 31, 1900, shows: Net earnings, \$451 687; addition to plants, \$36,177; charged to depreciation, \$63,149; accounts charged of, \$1.414; 7 per cent dividends on preferred stock, \$315,000; balance to profit and loss, \$35,945; total, \$451,687.

The Old Colony Trust Company, of Biston, and the Guaranty Trust & Safe Disposit Company, of Philadelphia will set in the capacity of depositories for the exchange of the Eric Telephone Company stock into the thirty-year 5 per cent. gold bonds of the Telegraph, Telephone and Cable Company of America that is to be secured by the Eric stock.

The Manchester Electric Company has notified the Secretary of State of New Hampshire of an increase in its capital stock from \$600,000 to \$1,000,000. This can be done under its charter without further legislative permission, as under the general law the corporation had the right to issue stock to the amount of \$1,000,000, but had not before availed itself of the full limit of this privilege.

A million dollar mortgage was recorded in the Register of Deeds office, Camden, A million dollar mortgage was recorded in the Register of Deeds office, Camden, N. J., on Friday last. The mortgage was given by the Camden and Burlington Gas and Electric Company to the Fidelity Trust Company, of Newark. The mortgage is secured by five per ceut, bonds on the rights and frauchises of the electric light companies of Merchantville, Moorestown, Haddorfield, Burlington, Mount Holly and the People's Gas Company, of Camden.

Stockholders of the Consolidated Gas Company, with but one dissenting voice, voted on the 9th inst to increase their capital stock from \$39,078,000, consisting of 390,678 shares, to \$54.595,200, consisting of 545.952 shares. The purpose of the stock issue is to retire \$36,000,000 of Consolidated Gas Company debenture bonds, which were issued temporarily last January to acquire \$36,000,000 of the stock of the New York Gas and Electric Light, Heat and Power Company.

President H. H. Vreeland, of the Metropolitan Street Railway Company, has

President H. Uveeland, of the Metropolitan Street Railway Company, has announced that the cable system will be changed to the underground electrical system and that additional lines will be built to cost on the whole probably \$10,000,000. The work of changing the motive power on Columbus and Lexington avenues will begin by the middle of this month and will be completed in three months. Cars will be diverted to Fourth and Six'h avenues. Following this work, the electrical service will be installed on Breadway. Two lines are to be built under the trical service will be installed on Breadway. Two li charter of the Fort George and Eleventh Avenue line.

Referring to the demand for copper Jesse Lewisohn of Lewisohn Brothers is reported as saying: "London is now in the market for a large amount of American copper, thou-ands of tons of it being required for war purposes. Germany and France are also buying liberally. The demand from the latter country can be traced to the construction of telephone systems. Germans need it for traction and manufacturing purposes. It is estimated that one-third of the entire copper production of this country is now being experted."

Receiver Grant's report on the New York Third Avenue Bailroad, presented to Judge Lacombe in the United States Court for the Southern District of New York, makes the following suggestions: "That all contracts be abrogated; that the receiver be author zed to issue certificates of ind but dress to the amount of \$6,000,000 in place of assessing stockholders; that permission be granted to abandon the construction of new work; that permission be given to abandon the building of the new \$5,000,000 power house; that construction work be limited to the completion of track work now under way until the road shall be in a prosperous condition; that the receiver be allowed to give this work to a competent contractor at a fair price." The receiver says that the debt now existing can be funded by an issue of \$5,000,000 in four per cent, bonds." A mechanics lien for \$60,276 61 was filed Monday by the Safety Insulated Wire and Cable Company against the Third Avenue road.

The New England Electric Vehicle & Transportation Company, in circulars to

The New England Electric Vehicle & Transportation Company, in circulars to stockholders under date of March 7th, states: "The New England Electric Vehicle Transportation Company has on hand a sufficient portion of its capital subscribed Transportation Company has on hand a sufficient portion of its capital subscribed to meet all the requirements of its business for some time to come, and it is thought that a large proportion of the stockholders of the company would prefer to have their present holdings of shares fully paid rather than have them assessable by vote of the board of directors. If, in the future, the development of the business requires additional capital, it is always in the power of the corporation to incresse its capital stock, giving the stockholders the right to subscribe for the same, but without imposing any obligation on them to do so. The directors have voted that it is advisable to decrease the authorized capital stock of the said company from \$25,000,000, divided into 250,000 shares of the par value of 100 each, to \$5,000,000, divided into 500,000 shares of the par value of \$10 each, the decrease to be effected by reducing the par value and increasing the number of shares as aforesaid, and by purchasing at par the original twelve shares of fully paid stock of the company of the par value of \$100 each by issuing from the unissued stock in lieu thereof and in payment therefor 120 shares fully paid of the par value of \$10 each. Scockholders will vote upon the question on April 3." Vol. XVIII.

Profits in the Telephone Business.

The recent absorption of the Erie Telegraph & Telephone Company by the Telephone, Telegraph & Cable Company of

America has brought about probably the greatest change in the telephonic situation that this country has yet seen. Before this consolidation the new independent rival of the Bell Company, although backed by men of influence and financial standing, was having like all new enterprises a hard row to hoe, due to the increasing efforts on the part of the Bell monopoly to throw obstacles in its path. Small independent companies in many parts of the country were either gobbled up by the American Telephone & Telegraph Company at exorbitant figures or were forced out of business, the apparent policy of the moropoly being that of the dog in the manger, namely, "if we can't have you nobody else shall."

By obtaining control of the Erie Company, the independent organization has acquired a property worth in the neighborhood of \$15,000,000, and what is still more important a concern that boasts of some 200,000 subscribers throughout New England and the middle Western States. This means that as soon as companies representing the Telephone, Telegraph & Cable Company of America have gained a foothold in such cities as New York, Chicago, Philadelphia and Boston, it will necessitate comparatively little work, and by no means an enormous outlay of money to furnish an excellent long-distance service covering a large expanse of territory.

That it will take some time for the new company to furnish as complete and extensive a service as that of the American Bell Telephone Company cannot be gainsaid, but that it ultimately will do so is not to be doubted, and when that time does arrive the public may be sure of cheaper rates.

It has been stated at various times that the existing Bell monopoly cannot afford to reduce its rates for service and still leave a fair margin of profit for its stockholders, which argument falls flat in face of the fact that yearly statements have shown a net profit of about 75 per cent. Fifteen per cent, is paid in the form of dividends to the stockholders while an outlet is sought for the remainder in real estate investments.

Referring to the profits of the New York Telephone Company, which as is well known is a lessee of the Bell, the "Commercial Bulletin" recently said:

"When the telephone was originally established in this city its charge was \$60 per year, and when the service had been constituted a monopoly the rate was advanced to \$150 and \$180. This rate is about three times the average charge in places outside of New York. Just what this means is expressed with mathematical precision in the fact that, according to sworn testimony by the officers of the company before a legislative committee in 1887, the corporation made a net profit of 473 per cent. within six years, or nearly 80 per cent. per annum, upon its original capital. This settles the whole question, without need of further evidence, as to the enormity of the monopoly and the boldness of its exactions."

Experience goes to show that whenever an independent telephone company has succeeded in gaining a foothold in a locality previously served by a Bell concern, rates have been reduced through competition to something like a reasonable figure. Such has proved to be the case in Detroit, where rates dropped owing to this cause from \$72 to \$36. Likewise a \$60 a year charge was just cut in half through competition in Richmond, Va., and it may therefore safely be predicted that when the Telephone, Telegraph & Cable Company of America has carried out its extensive plans, that the immense net earnings af the American Bell Telephone Company will be a thing of the past.

The Metropolitan
Controls the
Third Avenue.

The Metropolitan Street Railway Company of New York on Monday secured control of the Third Avenue Railroad,

and as a result all the traction lines in Manhattan and Bronx Boroughs will in future be under one management.

By this purchase interests amounting to more than two hundred million dollars are concerned, and an immediate termination of the Third Avenue receivership is anticipated. President H. H. Vreeland of the Metropolitan Railway will manage the entire system, and he promises many advantages to the public through an extensive system of transfers.

The stockholders and creditors of the Third Avenue Company have just cause for rejoicing that the consolidation has taken place, and the first person to congratulate Mr. Vreeland over the result was Henry Hart, who has been the directing power of the Third Avenue Company since the road was started.

It is to be hoped, however, that the present Grand Jury of New York will be able to discover the parties who wrecked the Third Avenue road, in order that they may receive the punishment they justly deserve.

Electricity as a Propelling Power for Ships.

Several years ago we referred in these columns to the fact that patents had been taken out by a gentleman by

the name of Richard B. Painton on an electrically propelled cruiser. This new departure in the way of steamship propulsion attracted considerable attention at the time, and the Navy Department at Washington is said to have carefully examined into the practicability of the system.

The invention consists in making use of a large number of independent propellers, instead of two or three as is now customary. Mr. Painton proposes to use exceedingly short lengths of shafting, independently operated by means of electric motors, so that in the event of one or more becoming disabled through any mishap there would still be a sufficient number of propellers in working order to drive the vessel through the water at a moderate rate of speed. With this arrangement of machinery the inventor asserts that a speed of forty knots an hour can easily be attained.

As already stated, although Mr. Painton's invention attracted considerable attention when first brought out, it had like many another invention apparently been consigned to oblivion, when interest in it was again recently aroused by the introduction into the House of Representatives at Washington of a bill looking to the appropriation of a sufficient sum of money to allow the Secretary of the Navy to contract for one of these specially designed cruisers.

The plans originally in the hands of the Navy Department called for a vessel some 600 feet in length, which, as may well be imagined, would cost an exceedingly large amount of money to construct, and if this is the vessel the bill now in Congress refers to, we would suggest that haste be made slowly in passing it. We have no desire of placing ourselves on record as endeavoring to restrain progress, but in the case of the cruiser in question-providing our surmises are correct it would certainly seem as though a test of this system of electrical propulsions could be made on a much smaller and more economical scale. That an electrical system of multiple screw propellers for a ship is an experiment may be inferred from the fact that up to the present time the field of usefulness of electrically-operated machinery on shipboard has proven comparatively limited. This is undoubtedly due to the fact that for a given horse power a triple or quadruple expansion steam engine would require less space and probably weigh less than an electrical installation of equal power. On the other hand, as is well known, electricity as an auxiliary motive power has its advantages. In view of the above it would seem much wiser to authorize, say, the construction of an electricallypropelled torpedo boat which would cost but a few hundred thousand dollars rather than a full-sized cruiser or battleship, which would probably entail an expenditure of several millions of dollars.

\* \* \*

Proper Banking Facilities Needed. Since our commercial relations with our new possessions and with South America have grown closer, and now that large quantities of electrical machinery and apparatus are

weekly being shipped to the southern portion of this continent, attention has been called to the need of laws authorizing and regulating banks for the transaction of international and intercolonial banking. In this connection the establishment of a commission to investigate banking and commercial conditions in the new possessions of the United States with a view to obtaining more exact knowledge of the nature of the banking legislation essential to the best interests of these new possessions, and to our own country in its business relations with them, is highly necessary. The past year has emphasized the need of such legislation and it is high time that Congress should recognize the disadvantage at which our country is placed by the lack of proper banking facilities, not only in South American commerce, but in our commerce with our new possessions. The need of banking facilities to care for the rapidly growing business between the United States and the territories over which she now exercises sovereignty is such that of necessity banking institutions have already been established over which there is little or no governmental supervision.

Unless adequate legislation is provided, the American exporter, in his trade with America's own colonies, will be compelled to endure all the disadvantages under which, in all South American markets and in many other markets of the world, he now labors in his competition. with foreigners enjoying superior banking facilities. When, by means of international banks and their branches, the proper banking facilities are afforded those engaged in foreign trade, they transact their business with these banks in much the same manner as the domestic shippers of the United States transacts business with our present banks. American in his South American trade, as compared with the foreigner in the same line of business, is subjected to the same relative disadvantages as are experienced by a domestic shipper without banking facilities, as compared with another who possesses them. Thus, as compared with the English exporter, who, when his goods are shipped, can receive advances from an English international bank upon the credit of his bills of lading and of the foreign consignee, concerning whose credit the home bank, through its foreign branch, is well advised, the American shipper, in the majority of instances, is denied such privileges, and must await entire, instead of partial, reimbursement until the arrival of the goods at the foreign market and the collection of the draft for the purchase price made at the time of shipment. In addition to this disadvantage, the American exporter in his trade with South American countries transacts all his business of consequence through English banks in terms of English money, paying the rates of exchange fixed by these foreign institutions,

The earlier that intelligent and careful consideration can be given by Congress to this important question, the better it will be for the trade relations of this country and to the manufacturers in general.

### UNDER THE SEARCHLIGHT.

### Notes and Comments on Various Topics.

A SUPREME COURT jury has awarded the sum of \$2,300 to one Mary Johnson as compensation due to her from the Nassau Railroad Company, of Brooklyn, N. Y., for injuries sustained under peculiar circumstances. As a result of the sudden stoppage of a car the plaintiff was heavily sat upon by a man unknown to her, but sufficiently indentified as being "a very fat man."

At the 204th meeting of the New York Electrical Society, to be held at the College of the City of New York on the evening of March 22d, the status of automobile development will be dealt with in three papers by Mr. A. L. Riker, Mr. C. J. Field and Mr. J. A. Kingman.

BERNARD M. SHANLEY, head of the contracting firm of B. M. and J. F. Shanley, died Monday in Newark, N. J. He was the promoter of all the trolley, gas and electric deals in Essex and Hudson counties, New Jersey. He was born in Newark in 1847, and was a graduate of the Newark Academy. A widow and three sons by his first wife survive him.

The opening of the first electric line in Mexico was marked by the coinage of a new Spanish word—motorista, for motorman.

A RESIDENT of Worcester, Mass., has invented a new incandescent lamp for which great things are hoped. The filament is starshaped and consists of a combination of asbestos iodine, aluminum and alcohol. The asbestos is saturated in iodine, and coated with aluminum filings. Crystalized alcohol is applied as a dust to the coating of the asbestos, and the thread is then subjected to an enormous heat. The principal usefulness of this lamp, it is thought, will be found on railways in parlor-car lighting where it can be embedded in safety in the walls or ceilings.

PITTSBURG will be represented at the Paris Exposition by the Murphy Manufacturing Company, a new concern. It will be an exhibit of interest to all persons connected with rapid transit, and will consist of a car wheel turning machine. It turns flat wheels without delaying the car from regular service for more than one hour. John Murphy, general superintendent of the United Traction Company lines of Pittsburg, is the inventor. The feature of the machine is that the flat wheel on a car can be put in good condition without its removal from the axle. It was exhibited at the recent convention of the American Street Railway Association. The method of operating is simple. The truck containing a flat wheel is raised from the ground and the machine, which resembles the tail stock of a lathe, pushes forth a center pin against the car wheel axle. An emery wheel is fed toward the periphery of the wheel, and being driven at a high rate of speed uniformly removes all metal which has prevented the rim of the wheel from being round and true. The average life of a car wheel is about 35,000 miles. The ordinary car will run 100 miles each day, making the life of the wheels about 350 days. With this invention the life is increased fully 25 per cent. or about

three months. A. G. LeGrand, an electrical engineer, will erect one of the machines at the Exposition and operate it during the show.

Admiral Dewey has sent to Representative Foss, acting chairman of the House Naval Committee, a report prepared by Lieut. H. H. Caldwell, the Admiral's aide, on the trial of the submarine torpedo boat Holland in the Potomac on the 14th inst. Lieut. Caldwell, who was on board the Holland during the trial, says that there was no accident or hitch of any sort. The mechanism worked easily, the crew was confident and skillful, the slight pitch of the boat on submersion disappeared when she attained the required depth, the torpedo was discharged with the greatest ease, and only a slight shock occurred when it left the tube. There was not the slightest confusion or hesitation in obeying orders. "It is worthy of note," says Lieut. Caldwell, "that from the first immersion the water as seen through the deadlights was entirely opaque, and at the maximum depth it looked entirely black. During the nearly three hours we were in the boat the air was entirely sweet." Lieut. Caldwell expresses the opinion that the duties of the crew could be easily performed by petty officers of the Navy after a short trial. He says also that a determined enemy, with a submarine boat like the Holland, could have made the occupation of Manila Bay by Admiral Dewey's squadron impossible. In this and the other remarks of his aide, Admiral Dewey

A company, to build electric launches, is being organized in Hamilton, Ont., by Mr. S. R. Sintz, of Chicago, Ill., and Mr. A. Ives, of Detroit, Mich. The electric batteries for these launches will be made by the Volta Storage Battery Company, Hamilton.

The co-operative telephone companies, organizing in the rural communities of Western Indiana, are proving successful and are rapidly multiplying. The company at Bowers Station has seventy-five subscribers, and the service last month cost each subscriber but 24 cents. It is said that the monthly service will soon be reduced to 20 cents. These companies have connection with each other, but a small tax is levied on those communicating with patrons of other companies.

By the construction of an important extension, making connection with the Canadian Pacific Railway Telegraph Company's system at Ashcroft, B. C., telegraphic messages will, at no far distant day, be received and dispatched from Dawson City, Yukon territory, to any point in the world. The necessary extension from Atlin, B. C., to Ashcroft, B. C., will be commenced immediately. To give Dawson direct service with Vancouver, B. C., nearly 1,000 miles of wire will be strung. Work on the Atlin-Ashcroft extension was started on the 15th of March.

TWENTY years ago John Grear, the Assistant Law Librarian of Cincinnati, took a notion to clean a 22-caliber revolver, with the usual result that the gun went off, and the ball penetrated the palm of his left hand. Grear, as a consequence, was laid up for forty-eight days, while Dr. P. S. Conner slashed at the hand in every conceivable direction to find the leaden missile. He did not succeed, and finally offered the opinion that the bullet was not there. For nineteen years Grear did not suffer even a

twinge of pain, but latterly he began to experience considerable suffering in that hand. He applied to a local physician, and by means of the X-rays the bit of lead was located. But with the insertion of the probe the bullet was found adhered to the bone, and it required three-quarters of an hour to bring it to the surface.

E. J. Pennington, the airship inventor, who is a native of Wellsboro, Ind., has again been heard from. After many unsuccessful efforts to enlist capitalists in his airship device, he went to London, England, where he promoted an automobile contrivance, and became immensely wealthy from the sale of his patents to English dealers. Last year he returned to America, and he is now located in Chicago. A few days ago the Pennington Aerial Mail, Express and Construction Company, capitalized at \$3,000,000, was incorporated at Chicago. Five well-known Chicago capitalists are backing the movement.

A DISPATCH from Hong Kong states that Governor General Doumer of French-Indo China has started to carry out the plan of connecting the French and Russian telegraph systems in Southeastern Asia. A cable is to be laid to connect Cape St. Jacques, at the mouth of Donhsi River, in Saigon, with Pulo Condor, an island situated eighty miles from the mouth of Mekong River, on the route between Singapore and Bangkok.

A Chicago society woman suggests that stray dogs be electrocuted instead of asphyxiated, as is now customary. The comptroller of that city referring to the plan is reported as saying: "First, you've got to eatch your dog before you kill him. Suppose electricity was used. I suppose a long row of chairs and strapping apparatus would have to be fixed up in the death chamber. Then there would be trouble in getting the dog strapped down, and how and where to apply the current would be the next question. A dog's tail doesn't afford much groundwork for a few thousand volts to pass through. If the shocking machinery was applied to the dog's mouth he might open it at the wrong time and swallow the current. Then what might kill one dog might only make another howl. Altogether I fear we would have a pretty how-dye-do at the dog pound. I am against the plan, though, on the score of increased expense.

Messi: , Siemens & Halske have brought out an improved Leclanché battery, which has all the conveniences of portability which belong to the dry cell, says the "Electrician," London. Within a rectangular or cylindrical cardboard vessel is inserted a zinc vessel of similar shape, whose bottom is made of zinc, or may be made of asphalt material, firmly united to the zinc sides so as to prevent any escape of liquid. Within this zinc vessel is placed the carbon electrode, which is surrounded by a porous depolarizing mass secured to it by a gauze bag. The electrolyte, which consists of a concentrated solution of sal-ammoniac, is contained in the inter-space between the carbon electrode and the zinc vessel, and is scaled hermetically with a layer of asphalt, so that the gases generated in working can only escape into the atmosphere through a gas chamber in the upper part of the cell by passing through the porous depolarizing material on which their passage has a continuous loosening action.

A BILL to create a commission to examine and license those engaged in electrical wiring and engineering has passed the N. Y. Senate and has been referred by the House to the Judiciary Committee. This bill is slipping along rapidly without any particular interest concerning it, but it is a question if it will not seriously increase the cost of wiring and other electrical work, without any compensating advantages.

If the interviews and alleged statements of European engineering visitors to this country can be relied upon, there will be placed within the next twelve months orders for no less than \$30,000,000 to \$32,000,000 worth of machinery and electrical equipment.

THE Canada Atlantic Railway Company has inaugurated a system of electrical clocks at terminal points on their line, which are a long way in advance of the old method of taking proper time. The clocks are run from electric storage batteries, and do not require winding, while time is taken from them all over the line at eleven o'clock A. M. each day.

AT the request of the "Royal Imperial Lower-Austrian Stadtholdership," the Austrian Elektrotechnischer Verein has answered eight questions submitted to it as to the danger of the overhead trolley wire. The committee appointed to draft the answers calls attention to the fact that the overhead network is constructed with a factor of safety of 5, and that thus the wire is no more liable to fall than the component parts of ordinary buildings. Telephone and telegraph wires break more frequently, and where possible they should not be placed over trolley wires. Where this is inevitable, guard nets or insulating wooden guards should be fixed between. Moreover, when a wire does fall, contact with persons is infrequent; and if it does occur usually arises through the person himself taking hold of the wire, and lastly, if such a contact does happen a dangerous shock is highly improbable. As to possible danger to the fire brigade, the committee considers that none exists, as the brigade is to be provided with means for switching off the trolley wire at any of the section boxes.

A BILL has just been introduced into the Dominion Parliament, by Mr. Casey, providing for the establishment in Canada of a Government system of telegraphs as a branch of the public service of the Dominion. It authorizes the Government when Parliament provides the money, to establish a system of Government telegraphs throughout Canada, either by construction of new lines or expropriation of existing lines. The bill provides that the rates shall be uniform throughout the country, a maximum of ten cents for ten words on private messages, and ten cents per 100 words on press telegrams. Mr. Casey instanced the splendid results of the Government system of telegraphs in Great Britain. The discussion brought out some interesting facts in connection with the system already under Government control. It appears that the marine department contemplates connecting the lighthouse station, at Belle Isle, with the mainland on the Labrador coast by means of the Marconi system of wireless telegraphy. Experiments made to establish communication with Sable Island by means of carrier pigeons has failed, and the suggestion is made that the Marconi system should be tested.

### HUDSON RIVER POLYPHASE POWER PLANT.

#### BY FRANK C. PERKINS.

A very interesting polyphase power plant is in operation at Mechanicsville. N. Y., and the accompanying illustration will give the reader a very good idea of the arrangement of the generators and the location of the switchboard and controlling apparatus.

There are, as will be noted, five General Electric polyphase generators in a single line, each having a capacity of 750 kilowatts. They are of the 40 pole type and are operated at a speed of 114 revolutions per minute, generating a potential of 12,000 volts.

The use of polyphase currents for power transmission is now conceded to be the best system under conditions found at Mechanics-ville, and the revolving field type of machine is particularly well adapted to this work, as the stationary armatures allow a winding for very high voltages. As a potential of 12,000 volts was found desirable and that without step-up transformers this type of machine was more easily insulated than the type using revolving armatures. The stationary armature avoids the use of collecting rings for the armature current

below are the measuring instruments, including voltmeters and ammeters for the various machines on the floor below. It will be noticed that the 5 generator panels are provided with high tension, double throw switches, divided by marble barriers, which prevent arcing across from one switch to the next and are found to be very effective.

The regulating mechanism is at the left of each generator on the raised platform. The regulators operate promptly and give very satisfactory results. The gates can be moved through their full travel in six seconds, should the full current be thrown off or on: these governors or regulators are called the Geisler electro-mechanical governors. Each main turbine consists of two parts of 42" horizontal Victor turbines, built by the Stillwell-Bierce & Smith-Vaile Company of Dayton. Ohio. The rating of each set is about 1,000 hp. at 18 ft. head.

The twenty ton crane used for moving the heavy machine and running the entire length of the dynamo room is not shown in the illustration.

Returning to the generators, it may be interesting to note that they deliver a current of 36 amperes at 12,000 volts and operate at 38 cycles per second. The wall at the left separ-

POLYPHASE POWER PLANT AT MECHANICSVILLE, N. Y.

and allows an extremely high insulation to be used.

It has been found possible to obtain from these machines installed, as indicated above a very high commercial efficiency and very close regulation approaching the best direct current machines of largest capacity in this respect.

The machines run very steadily, scarcely any vibration being noticed in operating at full load, this being due to the rigidity of construction and the perfect balancing of the armature. The bearings are self-oiling and self-aligning, which is another important detail of construction, insuring perfect operation.

The temperature of these machines under full load is particularly low, the magnetic circuit and windings being so designed as to produce a low temperature elevation and very little regulation is found necessary under variable load.

The high tension switchboard is mounted on a platform above the machines and is of the regulation, sectional panel type, 9 panels being used, 5 for generators and 2 for feeders. A row of pilot lights are noticed at the top, while just

ates the generators from the turbines. The building is 257 ft. long and each room is somewhat over 30 ft. wide. The power house is only a couple of miles from Mechanicsville, eleven miles from Troy, and about seventeen or eighteen miles from both Albany and Schenectady, and a fine market for the power is thus provided.

### The Automobile's Future.

The Automobile Club of America has lately issued an extremely attractive pamphlet of fifty-six pages in the interest of road agitation. It contains a list of the officers of the club and various addresses delivered before its members in this city last month. The pamphlet is devoted entirely to the improvement of highways in the State of New York, and the leading article is by State Engineer and Surveyor Bond. The States of Massachusetts, New Jersey and Connecticut have expended \$6,573,000 for highway improvements and constructed 910 miles of road, while New York has expended the sum of \$88,000 and built seven and one-half miles of road.

### THE APPLICATIONS OF ELECTRICITY IN MEDICAL AND SURGICAL PRACTICE.\*

BY H. LEWIS JONES, M. D.,

Medical Officer in charge of the Electrical Department in St Bartholomew's Hospital, London.

It was with very great pleasure that I received a communication from your President last autumn, asking me to write you a paper on Medical Electricity. And it is a pleasure to me for several reasons; first, because it is a recognition by the Institution of Electrical Engineers of the existence of their somewhat humble sister, medical electricity; secondly, because it gives me an opportunity of putting on record the position which medical electricity holds at the end of the nineteenth century; and thirdly, because I hope to be able to give you some information which may be new to you.

To a certain extent there is a correspondence between the work of an engineer in the repairing shop and that of a medical man in his practice; and this was brought quite forcibly to my mind a little while ago, when I had occasion to write and ask a member of the Institution kindly to come and advise me with regard to a motor which was in feeble health. When he came, he said that he had been sitting up all night with an engine which was on the point of breaking down. It seemed to me to be closely the kind of work which the medical man is often called to do, substituting only the human being for the machine.

The medical side of electricity has been prominent from the early days of the science. Its physiological effects were among the first observations made. In particular, the experiments of Aldini upon the muscles of recently killed animals seem to have created a deep impression upon the people of his day, and to have held out hopes of the discovery in electricity of valuable healing properties.

It is now one hundred and fifty years since the beginning of medical electricity. During the whole of that time it has had to fight its way in the face of many difficulties, and the most serious of these has been the passive resistance of medical men themselves. The vitality which the subject has shown under adverse circumstances is most significant. Medical electricity advances steadily, and the progress during the last decade has been very great. The commercial application of electricity and its house to house distribution by electric lighting companies have called into existence a large number of new instruments and new methods of treatment, and is helping the spread of the study of medical electricity by simplifying the means of obtaining the current when required. The accumulator has been of great service by affording a trustworthy source of currents for the use of surgeons in their galvano-cauteries and exploring lamp instruments. The discovery of the X-rays and their application to surgery and medicine have also done good to the cause of medical electricity by bringing electrical apparatus into more extended use, and the founding of X-ray departments in hospitals gradually leads to the development of electro-therapeutic departments in places where these are not already in existence. Most of the London hospitals now have electrical departments, and these are of manifest utility. At St. Bartholomew's Hospital we have about six hundred cases referred yearly to the electrical department from all quarters

<sup>\*</sup> Abstract of paper read before the Institution of Electrical Engineers, London, March 8, 1900.

of the hospital, exclusive of the cases for X-ray photography, the numbers of which are even greater, and the results of our treatment will compare favorably with those in any other branch of medical practice.

It is a little difficult to speak on a medical subject before a non-medical audience without incurring the suspicions of those who are always on the alert for signs of unprofessional behavior, and there is no branch of medical practice upon which the flerce light of criticism shines more sharply than upon medical electricity. I shall therefore have nothing to say on such matters as the relation of cases, statements of cures, and so forth, which might be thought to be unsuitable to my audience, but will try to meet you on the common ground of apparatus and methods, and in particular I shall try to lay before you some of the difficulties and problems which arise in the course of our medical work, in the hope that some of them may be solved by the advice and suggestions of those who are here present.

From conversations which I have had at various times with engineering friends, I am disposed to think that the number and extent of the applications of electricity to medical practice are not generally realized by electrical engineers. Indeed, when I have observed any reference at all to medical electricity in the proceedings of this and of kindred societies, the reference has usally been one of disavowal and dislike. I therefore feel that in making the present communication to you, I am undertaking the task of trying to show that electrical applications have a large and legitimate field of usefulness in medical practice: that it is quite possible to practice medical electricity without thereby becoming an outcast, and that the advertisements of electropathic or magnetic appliances do not represent the position of medical electricity any more than, shall we say, Keeley represented all that was best and truest in electrical engineering.

If what I have to say to you may seem to be about trifling matters, I hope you will bear in mind that our unit is the milliampere, while yours is the kilowatt, and that the currents which we handle and use would make but a small figure if their energy were expressed in terms of horse-power. Nevertheless, in the small technical matters which have to do with the management of various kinds of small electrical apparatus, the medical man requires a thorough proficiency, because it is absolutely necessary that he shall be able to make his apparatus work. On that account we may appear, in certain matters, to take elaborate precautions which might seem to you to be hardly necessary. With our coils and batteries we require unfailing methods for increasing or decreasing the current sent through the patient, without stops or jerks. We have to deal with the electric light mains, either direct or alternating, or both. And we have evolved for ourselves a long array of contrivances for utilizing the public supplies of electricity for medical purposes. Small transformers, portable accumulators, resistances to provide slopes of potential, which can be tapped as desired for varying voltages, contrivances for using the mains for all sorts of medical purposes are all enlisted in medical work. The statical machine is also coming again into favor, and to use a statical machine one must know enough about its management to be quite sure that after a patient's arrival there shall be no awkward failure of the machine to excite. Otherwise we are likely to be condemned as not understanding our apparatus, and the patient may be lost. All these little matters can only be learned gradually, and through a course of failures and disappointments, and when they have been learned thoroughly, they constitute a very far claim to the title of electrician.

The use of electricity in the production of hot-air baths with incandescent lamps or electrically heated coils of wire as the source of heat is a development of some promise: while, in the immediate future, we can see the approach of new methods of treatment by the light of the arc lamp. Each of these will demand a fresh extension of the field of electrical operations which the medical man will have to

And now I feel sure that some of you are ready to ask what can be done with all these numerous forms of apparatus. You might be inclined to ask me, as a patient of mine asked me the other day, whether I had ever done anybody any good by electricity.

We will take the simplest things first. No doubt it is familiar to all of you that an electric shock produces a muscular contraction, but possibly you may not all be aware of the extent to which the study of the muscular contractions has been developed. The muscles and their nerves are tested by the application of the induction coil current, and by the direct current of a battery of cells: the effects at opening and at closing of the circuit, the comparison of the action of the positive pole with that of the negative, and the measurement of the current needed to produce visible contractions are all examined, and in this way a system of electrical testing has been devised which affords the most valuable indications in the diagnosis of diseases of the nervous system. An important part of the work in the electrical department of a hospital is the testing and reporting upon cases of injury or disease of the various portions of the nervous system and of the muscles, and the accuracy of the answers given by electrical testing is something to delight one. For exactness and simplicity in its responses, one might compare electrical testing to the processes of measuring with a yard measure or weighing in a pair of scales; and numerous cases, which are quite obscure until tested electrically, become as clear as daylight as soon as the test has been made.

The behavior of a muscle under electrical stimulation is peculiar, and I think it may be useful to describe it. A simple shock, such as a single discharge of an induction coil or of a condenser, or a spark from the prime conductor of a static machine, causes a single muscular twitch, which within certain limits is proportionate to the energy of the discharge; the contraction lasts about one-tenth of a second. A rapid succession of shocks causes a succession of contractions which become fused so that the muscle enters into a permanent state of contraction which lasts as long as the stimuli are applied. Stimulation applied to a nerve causes contraction in its corresponding muscles, and when the stimuli are applied to the muscle itself, it is through the agency of its nerves that the stimulation acts.

With a continuous current the behavior is different. Here there is a twitch at the moment of closing the circuit through the nerve or the muscle. The muscle then remains quiescent and almost completely relaxed, while the current still flows, and another twitch is produced when the circuit is broken. This is the sequence of events with the currents of about five milliamperes which are used for testing. With currents four or five times as strong the muscle enters into permanent contraction with continuous currents. These contractions at make and break may seem to recall the phenomena of electro-magnetic induction, but the analogy is more apparent than real.

In certain kinds of paralysis these reactions change, and all irritability of the muscle to coil currents disappears. Stimulation of the nerves gives no response either to coil or cells, but the contractility of the muscle remains for currents from the cells applied directly, and may be more easily excited than in health, while the contraction itself changes in character from a rapid twitch, lasting one tenth of a second, to a slow, sluggish movement, lasting three times as long.

Stated briefly, the above are the observed facts of what is known as the reaction of degeneration. Its value depends upon the fact that it occurs only when the cause of the paralysis occupies certain definite portions of the nervous system. By its presence or absence we can therefore determine with great nicety the seat of the disease or injury. A point which is not yet explained is why the coil discharge should become ineffective on muscle which retains the power of responding to the battery current. What are the electrical differences between the two modes of stimulation?

Next as to electrical treatment. Progress in medical treatment usually moves along two lines. One of these is based upon experimental physiology, that is to say upon a study of the various processes in healthy tissues, and depends on the application of the facts observed to various morbid states. The other line of advance is by direct experiment in a more or less haphazard manner upon the sick. In medical electricity, as in medicine generally, both these lines have been followed. If we consider the first, we can apply the observed fact that electricity is a stimulus to certain living tissues, by asking how stimulation may be made use of in disease. The fact that electricity is a stimulus is easy to perceive in the case of nerve and muscle, and in the case of the sensory nerves of the body, and it is not difficult to prove that it acts in this way upon all living tissues, and the employment of electricity in disease is very largely in application of this process of stimulation.

Beard and Rockwell in the United States, and Débédat in France have shown experimentally that in young animals the rate of growth can be accelerated by suitable electrification. The former electrified daily two young puppies, and found that they grew faster than those of the same litter which were not electrified. Débédat in the same way proved an increase of weight in certain muscles of rabbits as compared with other non-electrified muscles in the same animals; the latter thus showed a local effect from localized electrification, the former a general effect from general applications, and this division into general and local treatment is a useful one. Thus for general diseases one gives a general treatment, and for local diseases a local application. D'Arsonval, by calorimeter observations and chemical analysis of the expired air, has established the fact that electrification increases the activity of the tissue exchanges of the body. Capriati recently has shown by careful dynamometric researches that the application of electricity to the central nervous system in the form of a continuous current along the spine does undoubtedly increase the muscular power, and that applications to the muscles of a limb have the same effect. In the United States it is becoming fairly common for athletes to undergo electrical treatment when preparing for a contest. General electrification applied to cases of simple failure of nutrition, such as debility after illness, or debility of any kind, produces a rapid improvement in the condition of the patient. In rickets, which is a comparatively simple form of defective nutrition, electrical applications have been shown by many observers to have a very high value. The more complex forms of defective nutrition such as 'rheumatism, gout and diabetes are not yet completely controlled by electricity, but indications are not wanting that in time good results may be expected. Already electricity is doing much for these conditions.

In the field of paralytic conditions there are certain strict limitations to the utility of electrical treatment, and it is here that electricity has lost credit quite undeservedly. People have expected electricity to work miracles, and because it could not do so have condemned it as useless altogether. When paralysis is due to some mechanical obstruction or destructive process in the nerve centers of the brain or the spinal cord, or when it is due to certain progressive degenerations in the quality of those parts, then electricity is powerless to help. So, too, when paralysis is due to a breach of continuity in a nerve trunk, electricity can do nothing until the surgeon has intervened and reunited the severed ends. In the latter case electricity comes in quite properly afterwards to promote the recovery of functions which had fallen into abeyance; in the former the surgeon cannot help, neither can electricity. Therefore it is very important to insist that in paralysis there are cases suitable for electricity and cases which are unsuitable. Happily the number of those which are greatly benefited by electricity is a considerable one.

Another field in which electricity is useful is in the relief of pain. Oftentimes it acts by influencing the circulation in the painful part, and relieving congestion and pressure in the blood-vessels. This I believe to be its mode of action in sciatica, lumbago and rheumatism, and in some neuralgias. At other times it seems to relieve a neuralgic pain by some direct influence upon the nerve-trunk in which the pain is felt. Effects upon the circulation are probably the important factor also in the relief of sprains, and in removing the chronic stiffness which may be felt in or around joints as the result of injury or disease. In this there is scope for considerable development. The good results which can be obtained are undoubted, although it is not generally known that this is the case.

Electricity can also be used to promote the passage of drugs into or through the skin, and this has a few minor applications in medical practice, among others for the introduction of cocaine to produce a local insensibility in minor surgery.

Electrolysis, again, is often useful in many small matters of surgery. It is used almost exclusively as a means of destroying tissue. Small tumors of various kinds can be very conveniently treated by electrolysis. The process is carried out by the introduction of metallic needles into the tumor, the products of electrolysis being thus liberated in contact with the tissue to be destroyed. The chief convenience

is the ease with which one can regulate the strength of current, and the amount of caustic chemical liberated, in exact proportion to the work required to be done. So fine and so delicate an application can be made, that the root of a single hair can be destroyed without leaving any visible scar, and the removal of superfluous hair in this way is a matter for which electrolysis is continually applied. Electrolysis with copper or zinc anodes with the object of procuring the liberation of salts of these metals in the diseased tissues has been recommended abroad, but does not seem to have received much attention in this country.

One of the most encouraging points at the present time in medical electricity is the improved quality of the scientific work which is being done in it. Last year, the French Government having declared the subject to be of public utility, a section of medical electricity was inaugurated at the Boulogne Congress of the French Association for the Advancement of Science. I attended the meetings of the section during the greater part of the Congress and was struck by the number and high scientific quality of the communications which were made in it. It was one of the best attended sections of the whole association. France, indeed, takes a long lead in the subject of medical electricity. They have at the present time three periodicals devoted entirely to the subject, and abundance of material seems continually forthcoming to fill the pages. One of them, the "Archives d'Electricité Médicale," is quite indispensable to students of medical electricity, for in addition to its original matter, it provides its readers with abstracts and a bibliographical index which keeps one in touch with all that is being done in medical electricity all over the world.

The progress in the small matters of detail, particularly with regard to apparatus, which has taken place during the last ten years, is considerable. I say ten years, because that represents the time during which my attention has been specially directed towards medical electricity.

It will be interesting to consider and compare the types of apparatus in common use to-day with those used formerly.

Electrodes.—The current is applied to the body of the patient by means of electrodes. These may be of the most varied forms, particularly with electrodes for internal applica-The cylindrical brass handles fitted with sponges and held, one in each hand, are obsolete or deserve to be, and for most external applications their place is now taken by a plate of flexible metal enclosed in wash-leather and a disk of metal also covered with wash-leather and screwed into a wooden handle. The former is called the indifferent electrode, and serves chiefly to complete the circuit through the patient's body; the other or active electrode is the one which is manipulated and applied over the affected region. For testing, the active electrode is fitted with a closing key. Examples of electrodes and other forms of medical electrical appliances are shown upon the table. Bare metal must never be allowed to touch the skin unless electrolytic, or painful effects are desired. Sores are easily produced in a few minutes by a few milliamperes of current if at any point the metal of the conductor touches the skin directly. For this reason some waterholding material, such as wash-leather, is always used to cover the metallic surfaces of medical electrodes.

The Battery.—The chief requirements in a

medical cell are, that it shall need no attention, and will not spoil on open circuit. The past few years have seen the almost complete disappearance from medical work of open acid cells such as thé Smee cell, the Bunsen and the bichromate cell. Formerly, when electrical treatment had to be carried out by means of ponderous oak boxes filled with cells of one or other of these kinds, the trouble and the dirt associated with them was enough to discourage all except enthusiasts. At the present day the Leclanché cell is the only type of battery which a medical man need consider, and even these are rapidly being abandoned, except for fixed installations, in favor of the modern, cheap and convenient dry cell. With these small dry cells for currents of small magnitude and with a few accumulator cells for those medical purposes which require a current of an ampere or more, as for example for the heating of galvano-cauteries and the illumination of small exploring lamps, the medical man is sufficiently equipped, and is no longer compelled to handle and prepare caustic solutions. Large bichromate batteries still survive in remote districts for the occasional production of large currents, but they are every year becoming less numerous, as secondary cells and the means of charging them from dynamos become more general over the country. All this simplification tends very greatly towards the increased popularity of medical applications of electricity, because perhaps one chief cause of its neglect has been. hitherto, the trouble of the management of the apparatus.

Current from the Mains.-After its introduction into commerce the current of the electric lighting mains was quickly introduced into medical practice, and we make large use of it in the electrical department of St. Bartholomew's, which is connected with the mains of the City of London Electric Lighting Company. The current impulses from the alternating mains have a physiological action resembling those of the induction coil; that is to say, the effect upon nerve and muscle is to produce a permanent contraction so long as the current is applied. But it is superior to the induction coil in being a less violent stimulus to nerve and muscle by reason of the more even and gradual rise and fall of its waves. Larger currents can be borne than from the induction coil, and judging from its effects in a long series of cases, it appears to be more thorough and more useful in its effects. Nearly all the cases formerly treated by the induction coil at the hospital are now treated by the current from the mains, the voltage being lowered to suit the requirements of the case (to about ten volts as an average), and indirectly we have gained largely in that the department is now free from the noise of eight or ten induction coils all vibrating and buzzing at once. Formerly the effect of that noise during a long afternoon was most trying. There is one marked difference in the effect of the alternating current which limits its use, and that is that if applied in the ordinary manner through moistened electrodes to the surface of the skin, it has a peculiar, disagreeable, burning effect. The more thoroughly the skin is moistened the less this is noticed, and when the current is conveyed to the patient through the medium of water, as in a bath, this disagreeable cutaneous effect disappears entirely. Consequently a mode of treatment by means of baths and the sinusoidal current has been developed to a very considerable extent, and with decided advantage to our patients. Large numbers of

our cases are those of paralysis of the upper limbs from injury or disease of the nerves of the upper extremities, and for these we use an arm-bath. The arm-bath is a stoneware trough, of suitable shape, having a metal electrode at each end, it is filled with warm water, into which the patient plunges the forearm The use of hot water as a medium and hand. for conveying electricity to a patient has many advantages. The current is much better borne. and therefore a stronger current can be used. Manipulation of the electrodes and personal handling of the patient is done away with, and the affected part is kept warm during the application. For these reasons we use it largely, and I continue to advocate its use as one which again is likely to increase the popularity of electricity among the medical profession, because it tends to simplify its mode of application. In addition to small local baths for parts of the body, we have a large bath, in which the whole of the body is immersed; and for general morbid conditions, as distinguished from local ones, the electric bath with the induction-coil current, or better still, with the sinusoidal current of the mains, is an extremely useful contrivance.

The Statical Machine.—This form of anparatus-the first introduced into medical practice-is showing very decided signs of a revival. In the United States the statical machine is already very largely employed, and I am told that in New York alone there are no less than three firms busily engaged in turning out statical machines at the rate of two or three a week. Those who are only acquainted with the effects produced by statical machines can have no idea of the difference between small and large instruments of this kind. The effects produced by a large statical machine are most decided, and it is only necessary for one to experience them once to see that treatment by them is by no means a mere treatment through the imagination. The most apparent effects of the statical machine are the profound and peculiar cutaneous sensory stimulation which can be produced by it, and the forcible muscular contractions which can also be produced by it when the administration is in the form of sparks. Its special field of usefulness probably lies, first, in its action as a general excitant; secondly, in conditions of neuralgia and other superficial pains; thirdly, in the conditions of muscular pain. In all these cases it acts quickly and thoroughly. It is quite common to receive a patient stiff and lame from lumbago or muscular rheumatism, and to see him leave in ten or fifteen minutes quite free, for a time at least, from his lameness or his stiffness. All this promises to be extremely valuable. The difficulty of understanding how a simple electrification by the static machine can influence the body makes many of us disinclined to believe that there can be any effect; but after watching cases carefully for some time, I can now say with certainty that some direct action does take place. I have only had a proper static machine for a year and a half. and therefore still feel rather a beginner with it. A very interesting matter is that whereas on the other side of the Atlantic the influencemachine which is used is invariably a modified Holtz's, on this side it is the Wimshurst which is considered the best. The American Holtz machine certainly has been developed into a most beautiful instrument; and, although it has one drawback when compared with the Wimshurst-that of not being self-excitingthat is a point so easily gotten over by means of a small accessory exciting machine in the corner of the case as to have no real importance. Size for size, I am disposed to believe that the Holtz gives a better output than the Wimshurst. It appears to be a more cheaply constructed machine, and needs no counter-shaft nor cross-belts.

The application of high frequency currents to medical practice has not had much extension. In France it is used a little. The currents are taken from the leads connected to ends of the primary helix, and no secondary coil is used. An induction coil is generally used to charge the Leyden-jar condensers of the system. The applications are either by a sort of spark or brush discharge from one terminal to the patient; or the patient lying on a couch if attached to one pole, the other being connected to a sheet of metal under the couch. This is called the condenser bed. Finally the patient may be enclosed in the actual helix connecting the jars, and his body thus made the seat of induced currents by "auto-conduction." Its chief applications have been as a mode of general electrification, but the brush discharge is also applied locally to the skin, and has seemed efficacious in curing certain skin diseases.

Ozone.-The use of electricity for generating ozone for medical purposes is attracting some interest. It is not so much that these applications of ozone are entirely new, as that the apparatus is now becoming sufficiently improved to make its applications easier. But the rapid development of electricity in so many directions of late years has given medical men just at present so many fresh things to handle that ozone in its medical applications is, as it were, waiting until some one has time to attend to it, the workers in medical electricity, in this country at least, are so few.

### MAINTENANCE AND INSPECTION OF AU-TOMATIC ELECTRIC BLOCK SIGNALS.\*

### BY H. S. BALLIET.

In considering the maintenance and inspection of an automatic block system we will treat with one installed as follows:

Double track road-both tracks protected.

All switches and cross-overs leading to the main track, or in the main track, protected by breaking the signal wire of the home signal, through the switch instrument attached to switch points, with a very close adjustment, so as to give a danger indication should the point be partly open, or the switch set wrong.

Track circuit sections from one-half to fiveeighths of a mile in length. Each section equipped with two electro-magnets, one of them being in series with the rails and battery, the other (which is of a higher resistance) being in multiple with the rails and battery at the battery end. Two cells of gravity battery in multiple arc supply the energy for these circults.

One distant and one home signal on each circuit, "normally at danger."

A visual switch indication at each siding or cross-over, "normally at safety."

In order to properly and economically maintain and operate such a system practical repair men and battery-men are required. There should be a repair-man and battery-man to every 15 miles of double track. As nearly as possible the headquarters of these men should

be in the middle of the territory, the same being located where there is a day and night telegraph office. Both of these conditions are required so that they can have free and easy access to the whole territory. On parts of the road where trains are few and fewer stops are made, and on busy parts of the road where infrequent stops are the rule, these men can cover the territory on foot in a short time. Such men should be made to keep with them at all times, while on duty, necessary tools to repair any bond wires which they may notice broken or torn off. Too much care cannot be exercised in keeping good bond wires on all joints and that they may make proper contact in the holes drilled into the rails, so as to cause no high resistance in the sections. These men should do all the bonding, or superintend the work if too much for them to do in person, whether it be ordinary every day repairs, such as renewing rails and frogs, or the relaying of new rails.

### TRACK BATTERY.

Each cell of track battery should be renewed every fourth week, this renewal to consist of setting up an entirely new cell, as may be directed. In order to give satisfactory service these cells should be "patched" the second week after renewal. This is to be done by removing the zinc and thoroughly cleaning it, removing a given quantity of zinc solution and replacing it with clear water. Under some very favorable conditions these rules might safely be made to read "renewal" every six weeks and "patching" every third week. Zincs should have a large surface exposed in these batteries, the four pound circular being about the best. These zincs should not be left in service after they are three-fourths consumed.

No copper should remain in a track battery in continuous service for more than three months. It should be removed and thoroughly dried. The copper collection should be carefully removed, and on some subsequent trip it can again be restored to service.

The blue stone should be carefully washed and screened when washing these cells. All copper collections and refuse should be separated from the blue stone so as to leave it in first class condition.

### SIGNAL BATTERY.

Whenever practicable a given number of gravity signal batteries should be installed in which to use the zincs removed from track batteries. This is more economical than to sell the the small zincs for scrap. In a signal battery these zincs can be used until they are ready to fall apart.

A better plan, however, is to get this material in good condition and turn it over to the telegraph department to use in their locals or mains.

The Gordon No. 1 cell, Excelsior cell, or La-Lande (all 6 x 8) are among the most economical and easiest to maintain on both signal and indicator circuits. They are clean, easily removed and non-freezing, and on account of their long life, great labor savers.

### INSPECTOR OR FOREMAN.

Every division which does not exceed 75 miles of double track should be in charge of an inspector or foreman, such person to have charge of the automatic signal force, which represents the maintenance of the division. All matters relating to maintenance should be handled by him. He should be held directly responsible for the proper working of all apparatus on his division. Where disk signals are in service he should be required to renew all

<sup>\*</sup>Abstract of a paper read before the Railway Signaling Club, March 13, 1900. From the "Railway and Engineering Review."

banners, when they become faded; see that relay contact points are kept clean and have an even and perfect contact at all times; that all relay points break properly; that the adjustment of no instruments is made without his personal supervision or knowledge; that all wires are kept properly fused and protected against lightning; that all ground connections are in perfect order; that all batteries are properly renewed and at the proper time; that all alterations or changes in circuits are done properly so as to be safe and cause no unnecessary stops to traffic. He is also responsible for the hiring of proper men to maintain the system. He should report to the division superintendent and to the signal engineer.

Inspectors should be required to carefully test all circuits with a milliammeter or some other suitable instrument and aim to keep all grounds and high resistances removed from the

### COST OF MAINTENANCE.

Under such a system as described and with a similar maintenance force the very best results will be reached. The following figures show an average cost for the service:

Cost per signal per year (labor and mate.

rial)	\$52.00
Cost per cell of track battery per year	
(material)	2.05
Cost per cell of signal battery per year,	
with indicators (material)	1.60
Cost per cell of signal battery per year,	
without indicators (material)	.90
Cost per cell of signal battery per year,	2.00
gravity cells (material)	2,00

### ELECTRICITY BUILDING OF THE PAN-AMERICAN EXPOSITION.

Elaborate designs have recently been completed for the Electricity Building for the Pan-American Exposition to be held at Buffalo, N. Y.. May 1st to October 31st, 1901. Displays of

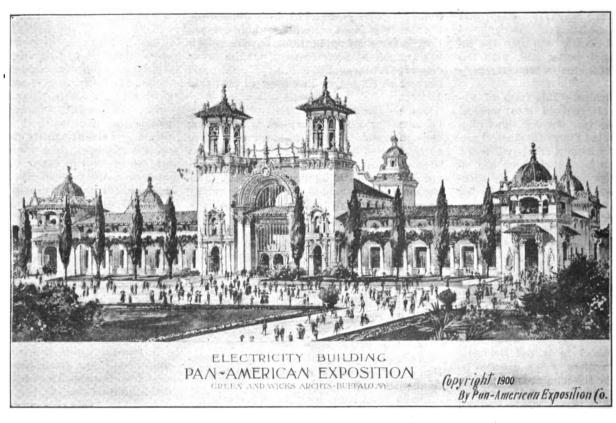

towers also have minor entrances through them.

The connecting work between the towers, the towers themselves, the pavilions at the corners of the buildings, and similar places, are to be brilliantly illuminated and made gay with banners and flags.

The modeled relief work of the building is of choicest design. The general ornamentation of the building is to be frescoes in an interesting mixture of reds, greens and yellows. The general color scheme follows that of the Machinery and Transportation Building and other groups of buildings of the Exposition. The building was designed by Green & Wicks of Buffalo.

### Automobile Lecture and Show.

Mr. James Joyce, Jr., of the Knickerbocker Athletic Club of New York City, has arranged an automobile lecture and show to take

circuits. Too much time cannot be taken to give these matters careful and thorough attention. In this way leaks are detected before they lead to crosses or other defects in the circuits.

INSPECTION.

Inspectors, repairmen and batterymen can make good use of their time while going over their territories by watching the operation of the various relays and signal instruments. Signals should at frequent intervals be tested by using some means of operating the signals and blocking them similar to a train movement. This is essential to finding many troubles and removing them without causing unnecessary stops.

All apparatus should be inspected once every month and a report made showing what defects were found and how remedied. Men should never be allowed to ride on trains, to do as they frequently report, "inspect." There is, however, a time when it is advisable for such a trip, and that is in stormy weather, to see that all signals are clearing properly or to see that lights are properly displayed. When inspecting on foot they are free to carefully scrutize every piece of material or apparatus which helps to make up the system.

all kinds in the practical and artistic uses of electricity, together with complete exhibits of electrical machinery and appliances are to be conspicuous features of the great Exposition.

The designs contemplate a very handsome and commodious building, as shown by the accompanying illustration. The structure is to be 500 feet from east to west and 150 feet wide giving an exhibition space of 75,000 square feet.

The south facade fronts the Mall and the north fronts the Midway. The east end is toward the massive Electric Tower, while the west end faces the Grand Canal. The building is long, low and inviting. The design of the facades shows artistic grouping. The openings of the pergola-like loggias, placed at frequent intervals, present a delightful effect, showing more and more of the reveals of the pllasters and openings as the eye travels to the end of the building farthest away from the observer.

There is a pleasing ending at each corner of the building, with a low-domed pavilion tower, and the building is interrupted at the center by the double-towered entrance. This entrance, wide and high, is spanned by an ornamental arch and supported each side by columns. The

place in the gymnasium at the club on Thursday evening, March 22, to which all members and their friends will be admitted. The lecturer of the evening will be Harold II. Eames, vice-president and manager of an electric vehicle company. After the lecture Mr. Hiram P. Maxim, the well-known inventor and engineer, will give a demonstration of electric and gasoline automobiles, one or two of which will be set up in the gymnasium. Mr. Eames is an authority on automobiles, and as the lecture will be a general one, descriptive of the various classes of automobiles in this country and abroad, it is expected to prove interesting. Ladies and junior members will be admitted.

Contractors are now figuring on the plans for the new works to be built by the National Cycle & Automobile Company at Hamilton, Ont. The premises will be four stories, 66 feet high, with 706 feet frontage, and will be located on Emerald street in that city. The estimated cost of the buildings is placed at \$35,000 The plant to be installed in them will cost \$350,000, and there will be 1,500 incandescent elect ic lights.

# **SOME ELECTRICALLY PROPELLED** VEHICLES.

That there is a constantly growing interest being taken in automobiles is evidenced by the number of horseless carriages in the streets and drives of this city. Some of the most attractive looking vehicles of this description are manufactured by the American Electric Vehicle dust and water-proof enclosed type, having a hollow armature shaft and a single reduction gear between it and the driving wheels. In all the vehicles band brakes operated by foot levers are used, while the direct system of steering with a handle moving a horizontal plane is adopted as being both simplest and most efficacious. The reverse lever is very small, and a single turn of it reverses the motion of the

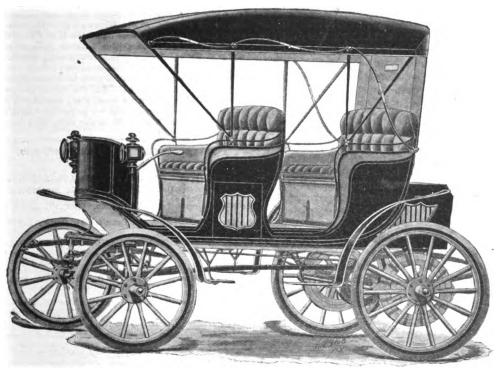

FIG. 1.—AN ELECTRIC SURREY.

Company, formerly of Chicago but now located in New York. Two of these carriages turned out by this well-known concern are shown in the accompanying illustrations. Fig. 1 is an electrically operated "surrey" with seats for four persons, while Fig. 2 shows a six-passenger "break." Both of these vehicles embody many similar features in the electrical equipment.

carriage. This lever is also a safety device and is removable. When the driver descends from the carriage, by simply putting the lever in his pocket he renders the vehicle "fool-proof" to the extent that it is impossible to operate it unless this particular lever is returned to its place.

The motive power makes available brilliant

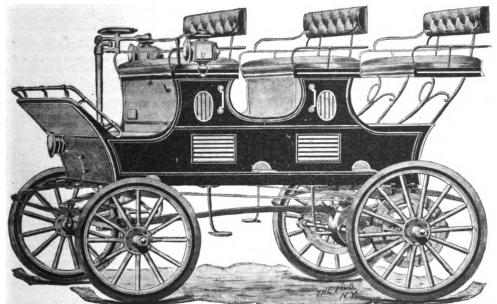

Fig. 2.—Six-Passenger Electric Break.

The running limit on a single charge varies from 30 to 50 miles, according to the condition and grades of the roadway, while the cost of running in all of them is claimed to be about one cent per mile where current is bought at the usual standard rates from electric lighting companies. A single motor equipment is used on all the vehicles, the motor being of a

electric lumps, which add to the safety and beauty of the family carriage, while electrically illuminated signs on the delivery wagons will be appreciated by every merchant or manufacturer using this class of vehicle.

The finish and coloring of the vehicles have been given the greatest attention by the manufacturer.

# CANADIAN NOTES.

(From our Ottawa Correspondent.)

The two companies applying for charters to build an electric railway from Ottawa, through the Winchester district, to some point on the St. Lawrence River, have been amalgamated.

The Vaughn township council, Ont., is considering an application from the Suburban Electric Railway Company for running power through the township to Woodbridge and Schomberg, Ont.

Mr. W. T. Stewart, electrical engineer, of Toronto, Ont., has been engaged to prepare an estimate of the cost of an electric light plant for the town of Toronto Junction, Ont.

It is understood that an application to the Legislature of the Province of New Brunswick, will be renewed for a provincial charter to operate an electric street railway in the towns of Fairville and Carleton, N. B.

Dr. Edward Gahan, of Boston, Mass.. is reported to have purchased the electric light plant of Digby, Nova Scotia. It is his intention to add new dynamos and engine and to give an all-night service.

The Shelburne Power Company of Shelburne, Nova Scotia, is applying to the Legislature of that province for a charter to develop power for electrical purposes on the Rosemay River near the town.

The city of St. Catherines, Ont., is asking the Ontario Government for power to raise \$1.0000, wherewith to acquire water powers to: the development of electric energy, for acquiring land for the erection of buildings, etc., all of which is intended to induce manufacturers to locate in that city.

Mr. Thomas Hawkins, of Montreal, Que., who is well known in Canada in street railway circles, has gone to Georgetown, Demerara, British Guiana, where he will construct an electric plant in that South American city. Mr. Brothers, of Montreal, will also leave shortly for the same place, he having charge of the construction of the electric street railway there in which a number of Montreal capitalists are interested.

A charter has been granted to the Central Ontario Power Company, formed for the purpose of developing electrical energy at Burleigh Falls, Ont., and for the purpose of constructing an electric railway in that vicinity. Among the incorporators are Hon. Richard Harcourt, J. A. Culverwell and F. W. Barrett, of Toronto.

The Montreal Electric Street Company proposes to put its electric wires underground. Mr. Wanklyn, the manager, in a communication to the road committee of the city council, stated that the company had decided to expend some \$200,000 on this conduit system, which has become necessary owing to the large number of cars which the company had to place on the streets to meet the public demand. This con luit system was also necessary for the heavy feeders, otherwise some of the streets would be completely covered with wires. By putting them underground the company also desired to obviate interruptions to the service from such contingencies as fires and the like.

The Great Northwestern Telegraph Company has definitely completed its arrangements with the Dominion Government for transmission of cable and press dispatches to and from places on the Yukon line. The rate from Victoria, B. C., on cablegrams is 33 cents per word to and from places on the Yukon line. The rate from Victoria, B. C., on cablegrams is 33 cents per word and on press dispatches four cents per word, there being in the case of press messages a minimum charge of \$2.50.

#### LONDON NOTES.

[From our London Correspondent ]

### Electric Driving in Locomotive Works

Slowly "very slowly"-British engineering construction works are moving in the direction of the more up-to-date equipment of their factories. The advantages of having a complete electrical power installation in large workshops are now better appreciated than they were a year or two ago. It has been remarked that the British locomotive manufacturer is not in so admirable a position as his transatlantic rivals to turn out locomotives with anything like reasonable speed, or so cheaply, These criticisms may be to some extent responsible for a change which is now being made over to electric driving at two very large locomotive building establishments in Scotland. We refer to the Hyde Park Works of Messrs. Neilson, Reid & Co., and the Atlas Locomotive Works of Messrs. Sharpe, Stewart & Co. The estimates which have been prepared in connection with these two installations show that in one works an annual saving in the coal bill is anticipated to the tune of £3,000, while at the other works it is still greater.

#### The Electric "Underground" to the City

The Board of Trade has passed, and it has now been opened for public traffic, the extension of the City & South London Electric Railway to Moorgate street in the city. The old terminus at King William street is now closed, as the new tunnels which run to Moorgate street are constructed at some depth below this.

#### The Electric Lighting of London.

It may be interesting to mention that London electricity supply companies are prospering by leaps and bounds. It is true that in some instances the companies have had to face smoke nuisance prosecutions, higherpriced fuel, threatened competition, breakdowns and so on, but all the reports issued thus far by companies for 1899 show increased profits distributed amongst the stockholders. The Charing Cross and Strand Electricity Supply Corporation paid 9 per cent. for 1899 against 8 per cent. in 1898; the Notting Hill Company 7 per cent. against 6 per cent. in 1898; St. James' and Pall Mall Company 14½ per cent. (same as for 1897 and 1898); the Westminster Electric Supply Corporation 13 per cent. compared with 12 per cent. for 1898; the Chelsea Electricity Supply, 6 per cent.

# LEGAL NOTES.

The Rolfe Electric Company and the Eureka Electric Company have brought suit against the Sterling Electric Company of Lafayette, Ind., Frank B. Cook, W. E. Doolittle, Mortimer Levering and C. M. Murdock, officers of that company. The suit is brought to enjoin the Sterling Electric Company and its officers from manufacturing the Sterling protectors. The Rolfe and Eureka companies own and control patents covering broadly protective devices for telephone and telegraph circuits, cables, cable heads and the like, which patents the Sterling protectors infringe. It is the intention of the Rolfe and Eureka companies to push this suit against the Sterling Company, and also to prosecute users of Sterling protectors for infringement of these patents.

Justice Lawrence, of the Supreme Court, has appointed John H. Cheever receiver of the

Vance Electric Company, electrical contractors at 136 Liberty street, New York City, on the application of Directors Arthur S. Vance, John H. Cheever and Oscar C. Bocot, in proceedings for the voluntary dissolution of the corpora-

Last week Justice Lawrence, in the Supreme Court of New York City, handed down a decision in the National Light and Power Company case, in which three Philadelphians allege that an attempt is being made to defraud them in a transaction involving \$25,000. They charge collusion between John Post, the plaintiff, in a suit to get possession of the money, and Edward S. Savage, one of the defendants, who was made trustee of the \$25,000 trust fund. An order had been granted to the Philadelphians through their attorney, C. J. McDermott, for the examination of Mr. Savage before a referee. Savage appealed from this order and asked Justice Lawrence to stay the reference pending the decision on his appeal. The Justice said that the stay would be granted if Mr. Savage brought the money in dispute into the jurisdiction of the court. Mr. McDermott had previously made a motion before Justice Beekman asking that this be done. It was asserted then that Mr. Savage had deposited the money in the Union County Bank of Rahway, N. J., which is now in liquidation. Justice Beekman had not handed down his decision when Justice Lawrence entered his order.

#### PERSONAL MENTION.

Mr. Robert T. Fowler, of the electrical department of the New Haven (Conn.) Railroad, has resigned his position and accepted a place with the firm of L. C. Gillespie, a prominent importer of New York City.

Mr. James G. Smith, joint inventor with Stephen B. Stearns of the duplex system of telegraphy, died at his home in New York City last week at the age of 63.

Mr. Mormoru Jio. a Japanese graduate of the department of electrical engineering at Kansas State University has recently been appointed superintendent of a proposed system of electric railways between cities in Japan.

Senator George L. Wellington has lately been elected president of the Cumberland (Md.) Street Railroad Company, which has purchased the Edison and Westinghouse interests in the Edison Electric Illuminating Company of Cumberland.

Mr. Albert Cooper Seibold, a resident of Mount Vernon, N. Y., who had invented an electrical device for propelling canal boats, and also an enclosed arc lamp that he claimed would burn 500 hours, died recently.

## INCORPORATIONS.

The Elyria Plumbing, Heating & Electric Company, Elyria, O.-to deal in electrical and plumbing supplies. Incorporators: Earle Wurst and Edward B. Gale.

The McMullin Motive Power & Construction Company, Chicago, Ill.-to manufacture motors, engines, etc. stock, \$300,000. Incorporators: F. R. McMullin, J. H. Hazard and W. N. Fitzpatrick, all of Chicago.

The Union Electric Manufacturing Company, Portland, Me. -to manufacture and deal in electrical apparatus. Capital stock, \$200,000. Incorporators: A. D. Boyd, J. K. Knapp J. R. P. Rogers, of South Portland; E. W. Dodge, L. F. Jordan, C. E. Bailey, E. Harlow, Jr., C. F. Long, of Portland; B. G. Ward, attorney, Portland.

The Central Traction Company, Indianapolis, Ind.-to build an electric line from Indianapolis to Kokomo. Capital stock \$1,200,000. Incorporators: H.C. Stillwell and G. Lilly of Anderson, and others.

The Oil Belt Traction Company, Huntington, Ind.-to construct and operate an electric road from Huntington through several counties. Capital stock. \$1,000,000.

The C. R. Fish Company, Portland, Me.-to do a general electrical business. Capital stock, \$50,000. Incorporators: H. Mulholland and J. S. Keenan, both of Boston; C. R. Fish, of Cambridge; S. C. Perry, attorney, Portland,

The Denver City Electric Company, Denver, Col. - to fur nish light and power in the city of Denver and vicinity and the incorporation is to last 20 years. Capital stock, \$500,000. Incorporators: Horace W. Bennett, Milton Smith, William Church, T. J. O'Donnell, Julius Myers, Gilbert, Wilkes and

The Pearsall Pneumatic Tube & Power Company, New Capital stock, \$22,000. Directors: Albert W. Pearsall and Adolph Reisenberg of New York City.

#### ELECTRICAL PATENT RECORD.

[This department is edited by OSCAR A. MICHEL, Solicitor and Attorney for AMERICAN AND FORRIGN PATENTS at 302 and 304 Broadway (Room 1204), New York City, also at 639 F street, N.W., Washington, D.C., who has been identified with this work before the U.S. Palent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all informa tion regarding the cost of United States and Foreign Patents trade Marks, Designs, etc., will be given free upon application by addressing OSCAR A. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon pay ment of ten cents. When ordering give name, date and title of invention wanted.

#### LETTERS PATENT ISSUED MARCH 18, 1900.

ELECTRIC RAILWAYS AND APPLIANCES.

645,186. Trolley-Head. Edgar J. Rauch, Brockton, Mass. Filed May 24, 1839.
645,259. Electric Third-Rail System. George C. Hicks, Chicago, Ill. Filed July 10, 1839.
645,351. Trolley. Thomas Dennis, New Castle, Pa. Filed July 22, 1899.

#### ELECTRIC LIGHTS AND APPLIANCES

645,244. Manufacture of Incandescent or Other Lamp Globes. Walter C. Fusner. Allegheny, Pa. Filed Dec. 9, 1899.

Walter C. Fusner, Allegheny, Pa. Filed Dec. 9, 1899, 212. Electric Lighting Apparatus for Railroad-Cars. Edwin J. Preston and Arthur B. Gill, London, Eng., assignors to the J. Stone & Company, same place. Filed Jan. 2, 1900.

216. Electric-Lighting Apparatus for Railroad-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, New York City. Filed Nov. 16, 1899.

206. Fastening Device for Heads of Electric Glow-Lamps. Johann Kremenezky, Vienna, Austria-Hungary. Filed March 10, 1888.

499. Electric Are Lamp. William Vogel, New York City. Filed Aug. 5, 1899.

#### ELECTRICAL MACHINERY AND APPARATUS.

645,688. Electric-Motor Control, Wells R. Hamlen, Johnstown, Pa., assignor to the Johnson Company of Pennsylvania. Filed April 19, 1899.
645,689. Appratus for Control of Electric Motors. Wells R. Hamlen, Johnstown, Pa., assignor to the Lorain Steel Company of Pennsylvania. Original application filed April 19, 1899. Divided and this application filed Sept. 12, 1899.

April 19, 1899. Divided and this application filed Sept. 12, 1899.
645,103. Electric-Circuit Controller. Benjamin N. Jones, Orange, N. J. Filed July 21, 1899.
645,116. Electric-Motor Control. Frank A. Merrick, Johnstown, Pa, assignor to the Johnson Company of Pennsylvania. Filed April 19, 1899.
645,117. Electric-Motor Control. Frank A. Merrick, Johnstown, Pa, assignor to the Lorain Steel Company, of Pennsylvania. Original application filed April 19, 1899. Divided and this application filed Aug. 11, 1899.
645,125. Alternating-Current Meter. William H. Pratt, Lynn, Mass., assignor to the General Electric Company of New York Filed June 7, 1899.
645,126. Electric Meter. Lyman C. Reed, New Orleans, La, Filed July 10, 1899.
645,127-645,128-645,129. System of Electric Metering, Lyman C. Reed, New Orleans, La, Filed July 10, 1899, Nov. 3, 1899 and Nov. 3, 1899.
645,130. Alternating-Current Motor. William G. Rhodes, Salford, England. Filed Nov. 22, 1899.
TELEPHONES AND TELEPHONE APPARATUS.

# TELEPHONES AND TELEPHONE APPARATUS.

645,402. Telephone-Exchange System and Apparatus. John Z. Miller, Eric, Pa., assignor of one-half to Peter H. Adams, same place. Filed Dec. 12, 1899.

### MISCELLANEOUS.

55. Apparatus for Producing Caustic Soda. Henry S. Anderson, Springfield, Mass. Filed Feb. 23, 1899.
567. Hanger for Electric Ceiling Fans. William H. Ayers, West Hoboken, and Emil Groth, Union Hill, N. J.

Avers, West Hoboken, and Emil Groth, Union Hill, N. J. Filed July 20, 1839.
695. Method of Electric Welding. Robert P. Brown and Franklin E. Morse, New York City. Filed March 16,

Franklin E. Morse, New York City. Fried march 10, 1898.
187. Wire-Conduit Tubing. Cortlandt D. Richmondt, Milwaukee, Wis. Filed Nov. 20, 1899.
198. Process of Producing Incandescent Materials Suitable for Electric Lighting. Georg Alefeld. Darmstadt, Germany, assignor to the Pharmazeutisches Institu Ludwig Wilhelm Gans, Frankfort-on-the-Main, Germany. Filed Feb 21, 1899.
247. Method of Starting Asynchronous and Synchronous Monophasic Electric Motors. Eugenio Cantono, Rome, Italy. Filed July 7, 1899.
251. Battery-Electrode. Frank K. Irving, Newark, N. J., assignor of one-half to Andrew G. Vogt, Filed May 2, 1899.

Method of Electrically Treating Materials. Edward

645,284. Method of Electrically Treating Materials. Edward G. Acheson, Buffalo, N. Y. Filed May 23, 1899.
645,377. Electrical Street Indicator. George W. Stevenson, Cramer's Hill, N. J., assignor to Theodore Leas, Camden N. J. Filed Dec. 7, 1898. Renewed Dec. 20, 1899.
645,398. Igniter for Explosive Engines. Lewis Jones, Jr., Philadelphia, Pa. Filed June 22, 1899.
645'405. Electrical Music-Box. Josef Natterer, Jersey City, N. J., assignor to the Symphonion Manufacturing Company, New York City. Filed July 29, 1899.

# REISSUE. 11,812, Rail-Bond.

812. Rail-Bond. C. J. Mayer. Philadelphia, Pa., assignor to the Protected Rail Bond Company, same place. Filed Feb. 12, 1900. Original No. 642,554, dated Jan. 30, 1900.

### GENERAL NEWS.

## What is Going On in the Electrical World.

#### LIGHTING.

Bentonville, Ark.—The citizens of this place contemplate the erection of an electric light plant.

Birmingham, Ala.—The board of revenue of Jefferson county will receive bids for an electric light plant to be established in the court house and jail.

Blakely, Ga.-Investigations are being made relative to constructing an electric light plant at this place.
Address W. L. McDowell.

Bunker Hill, Ind.—The people here are interested in the electric light question.

Caro, Mich.—There is a movement on foot to organize an independent electric lighting plant at this place. Several prominent business men are interested in the acheme

Cherry Creek, N. Y.—If a franchise can be secured, E B Crissey and L. C. Langworthy will install an electric light plant here.

Chicago Junction, O.—The citizens of this place will vote at the spring election on issuing \$15,000 worth of bonds to build an electric light plant.

Clinton, Wis.—The village board has called a special election to vote upon the question of erecting an electric light plant.

Corydon, Is.—An election will be held March 26 to vote on the question of issuing \$12,000 in bonds for an electric light plant.

Fargo, N. D -The Hughes Electric Company of this place has sold its plant to the Edison people. It is announced that \$100,000 will be expended in improvements. General Hughes & Sons still retain large interests in the company.

Frankfort. Ind.—This city has decided to install an electric light plant to cost \$60,000.

Galena, Ill.—The city council has appointed a committee to select a site upon which to erect a new electric light plant.

Sault Ste. Marie, Mich —W. M. Everett and others have submitted a proposed franchise for a new electric light plant, which will be in operation 12 months from the time of granting the franchise.

Grand Forks, N. D.—The Grand Forks Gas & Electric Company will soon erect a new electric light plant in this city. Superintendent Roycroft can be ad-

Little Falls, N. Y.—The citizens of this place are arranging to have a steam electric lighting plant of their own, the estimated cost of which will be \$46,680.

Martinsburg, W. Va.—Sprague Bishop, representing the Bishop Electric Light & Power Company, has made application to the city council for the granting of a franchise throughout the city for the purpose of erecting and conducting an electric light plant.

Middleville, N. Y.—It is rumored that there will be electric lights here in the near future.

New Martinsville, W. Va.—F. C. Lowther is interested in the electric light project now in question here.

Opelika, Ala.—The Alabama Electric Light & Power ompany, lately incorporated, will erect a new electric light plant.

Rawlins, Wyo.—The purchasers of the Rawlins electric light plant have ordered an entire new outfit of machinery, which will be put in soon.

Richmond, Va.—The light committee of the Carnival Association is soliciting bids for the construction of an electric light plant.

Richmond, Ind.—The citizens will decide by vote at the coming election whether the city council shall pro-ceed to put in a municipal electric light plant or not.

Stillwater, Minn.—An electric light plant is to be erected by the city council.

Terrell, Tex.—The plans and specifications have been prepared for a 600 horse-power electrical heating and steam plant to operate the electric lights, heating and laundries of the North Texas Iúsane Asylum.

Toronto, O.—The new Toronto Electric Light & Power Company is about to build an electric light plant just east of the Toronto depot. A. G. White is construction engineer for the company.

Union City, Mich.—The electric lighting system here is inadequate, and the citizens will shortly vote on the question of spending \$8,000 for improvements.

#### STREET RAILWAYS

Bristol, Va.-The Bristol Belt Line has decided to build several extensions in the town and also to the suburbs. G. L. Carter is interested in the project.

Calhoun, Ky.-The people here are greatly elated with the prospects of the electric railway to Owensboro. Work will be begun soon and the road will be in operation by September.

Canal Dover, O—Local capitalists are engineering a plan which they believe will result in a continuous trolley line across this State from Lake Erie to the Ohio River, which, it is argued, can be operated to a better advantage when the electric lines which now stretch over a good part of the State are connected and the untracked portions bridged over.

Chattanooga, Tenn.—The Chattanooga Electric Railway Company has decided to enlarge its power house; also to build the proposed extensions to Sherman Heights and Rossville. J. H. Warner is president of

the company.

Coshocton, O.—The right of way for the Zanesville, Adamsville & Coshocton Electric Railway is about secured. The line will do a passenger and freight business and will cost about \$250,000. J. B. Wilson of Zanesville, O., is president.

Dalton, Mass.—Local parties are interested in forming a company to build an electric railroad between this town and Hinsdale. Among those interested are A. E. Chamberlin, D. H. Tower, W. L. Tower and others.

Detroit, Mich.—The right of way for the Detroit & cledo Electric Railway has all been secured and work will begin early this spring.

Ellenville, N. Y.—Charles N. Morse is interested in

the proposed trolley road between here and Lackawack.

Foxcroft, Me.—There are rumors of an electric road from here to Sebec Lake, in the near future, to be obtained from the Greely mill.

Franklin, Tenn.—Negotiations are on foot for the construction of an electric car line from here to Nashville via the Nashville turnpike.

Irvington, Ind.—The town board is negotiating with the Indianapolis & Greenfield Electric Railway Com-pany with a view toward granting the company a fran-chise to operate its lines through the streets of Irving-

Kenosha, Wis.-P. F. Havnes and G. L. Clauson Chicago have asked the council for a san electric railway through this city.

Kenova, W. Va.—The Ohio Valley Electric Railway Company will receive bids until March 31 for the con-Company will receive bids until March 31 for the construction of about 8 miles of electric railway from the Big Sandy near Kenova to Central City near Huntington, W. Va. Address G. Brown, chief engineer of the Ohio Valley Electric Railway Company.

Marshall, Mich.—F. N. Rowley of Kalamazoo and C. H. Frisbie of Jackson have made application for a franchise for an electric street railway through this citv.

Marinette, Wis .- The Marinette Street Railway Company will build an electric railroad line from here to the town of Peshtigo, a distance of savan miles the town of Peshtigo, a distance of seven miles, some time during the coming year. It will cost about \$40,000.

Meriden, Conn.—Electricity as the motive power on the Meriden and Waterbury branch of the Consolidated road is now looked upon as a certainty.

Natchez, Miss.—J. C. Shaffer and H. W. Bogers of Chicago with F. S. Mordaunt of Vicksburg, Miss., have become interested in the plan to build a street railroad in Natchez

Odessa. Dal.-There is talk of building a trolley line between here and Middletown.

Pittsburg, Pa.—The project to construct a traction line from this city to Cleveland now looks as if it may go through. If the management gets the right of way through Sewickley it will then only be a question of

Richmond, Ind.—Henry B. Pruden of Dayton, O., of the Richmond & Eston Electric Railway Company has filed a petition with the county commissioners for a franchise over the National road from this city to Dublin, twenty miles west.

Rockford, Ill.—The movement looking to the construction of an electric line from this city to Beloit and farther north is being carried on, and the supervisors will be called on for the right of way along the highway from Rockford to Rockton and then to Beloit. W.W. Austin is one of the promoters.

Valparaiso, Ind.—G. Mitchener of this place has secured a franchise for an electric line between here and Michigan City.

Wareham, Mass.—A franchise has been granted to the Middleboro, Wareham & Buzzards Bay Street Rail-way Company for the right to construct a trolley railway through this town.

Xenia, O -J. P. Martin is interested in the construction of an electric road between this city and Spring-

# POWER AND TRANSMISSION PLANTS,

American Falls, Idaho.—It has been decided by the Oregon Short Line to construct an electric power plant at this place. Work will be commenced this spring. Electrician Geo. L. Thayer is to have charge.

Appleton, Wis.—O'Keefe & Orbison, hydraulic engineers and mill architects, have prepared plans for the development of about \$40,000 horse power of electrical energy at the Sault Ste. Marie. The enterprise is under the direction of the Edison Sault E'ectric Company, who will use the power for electric lighting. and for lease to various manufacturing plants at "the Soo."

Redding, Cal. - An immense electrical power plant is to Redding, Cal.—An immense electrical power plant is to be established on the the McCloud River in this county. Preliminary work is to commence immediately. The purpose of the plant is to furnish power to the numerous mining and smelting works of the county and to transmit power and light to this city. The plant will be constructed with a capacity of 4,000 horse power. A canal will be built for 10,000 horse power capacity, so that the plant may be increased upon demand.

#### MANUFACTURING.

Gloversville, N. Y.-The Bachner-Moses Company Gloversville, N. Y.—The Bachner-Moses Company has awarded contracts to the Troy Belting & Supply Company for a new steam and electric plant for the new factory which the company is to erect in addition to the present establishment on Marshall avenue. The engine will be of 40 hp. and the boller 60 hp., and the electric plant will have a capacity of 250 lights.

Syracuse, N. Y.—The Pass & Seymour Company, manufacturers of electrical supplies, is doing double the amount of business it did a year ago. Although the capacity of the plant in its new building has been doubled, the orders have increased along with the company's ability to take care of them.

Troy, N. Y.—The E. G. Bernard Co. of this city has received a contract to equip the steamer Chateaugay of the Champlain Transportation Company with a searchlight and electric lighting system. The company will also install a searchlight and electrical apparatus on the patrol boat of the Buffalo Fire Department.

#### COMPANY MATTERS.

Atlanta, Ga.—The Georgia Electric Light Company, of which H. M. Atkinson is president, has purchased the building at 24 East Alabama street, and will improve it preparatory to installing \$100,000 worth of new machinery. An electric storage tattery will be installed and three rotary transformers, etc.

Chicago, Ill.—The Mutual Electric Company of this city has been dissolved.

Jersey City, N. J.—It is understood that the National Power & Manufacturing Company, formed recently with a capital of \$2,000,000, is connected with the street and electric light companies with which James C. Young and Bernard Shanley, of this city, are connected. The National Power & Manufacturing Company will operate all the different electric plants which are now operated to supply power to the North Hudare now operated to supply power to the North Hud-son Street Bailway Company, and the electric plants of this city and Newark.

this city and Newark.

Joliet, Ill.—The American Railway Company, which owns the electric street car lines in this city, has bought the Chicago Rapid Transit franchise running from Lockport to Chicago and the franchise of the Chicago & Des Plaines Valley Railroad Company, which makes three franchises in all. A double track will be built from Joliet to Lemont, work on which will be commenced early this spring.

menced early this spring.

Le Roy, N. Y —The Le Roy Gas & Electric Company, which has a five years' contract for lighting the village, is negotiating for the purchase of the Haskin's mill property, a fine water privilege on the Oatka in the southwestern part of the village. If the deal is consummated it is understood that the present plant will be removed to that point and operated by hydraulic DIESSUFO.

Mt. Pleasant, Utah.—The Mt. Pleasant Electric L'ght Mt. Pleasant, Utah.—The Mt. Pleasant Electric L gnt Company has ordered a new generator for the plant in this city, which is to be in place by April 15. The generator is of 1,016 sixteen candle light capacity, and will require 80 horse-power to operate it. It is of the alternating style, and will be accompanied by three transformers, thus giving the company the ability to transmit current to almost any distance. It is the intention of the company to extend the system of wires both north and south, and thus cover almost the entire city.

Pompton Lakes, N. J.—An explosion recently occurred in the H. Julius Smith Electric Works apparently without any warning. A large portion of the works were wrecked, and the loss on stock and machinery is estimated will reach \$50,000.

Woodbury, Pa.—It is given out on good authority that the stock of both the Woodbury Electric Light & Power Company, and the Consumers' Gas Company, which hold sole franchises for lighting this city, have been absorbed by a syndicate, which has been negotiating for control of the plants the past few months.

# AUTOMOBILES.

New York.—Three scientific Frenchmen, who arrived on the L'Aquitaine from Havre a short time ago, have set out to accomplish the task of crossing the icy wastes of Alaska into the heart of the Klondike by an automobile. The gold-hunters brought with them an automobile of five horse power, which is run by gasoline, and a motor tricycle of three horse power, run by petroleum. They intend to substitute runners for the rear wheels and place a rim with saw teeth on the front wheel. The power applied to the front wheel will enable the teeth to maintain a purchase on the ice, while the runners slide swiftly along, imparting momentum to the automobile sleigh. In the wake of the automobile will be dragged a sledge, on which are to be borne the camping outfit of the travelers, fifty gallons of gasoline, duplicates of the automobile's parts and a tandem bicycle, to be used for exercise or warming up. On the return trip from Dawson in the fall, the automobile will be transformed into another type. ing up. On the return trip from Dawson in the fall, the automobile will be transformed into another type of conveyance by placing the driving machinery with n a cance, substituting paddles for wheels and sail | y gasoline power to St. Michael's.

Poughkeepsie, N. Y.—Colonel John Jacob Astor has ordered an electric vehicle of the carryall size, which he will introduce in passenger service between Rhinecliff station, on the Hudson River Railroad, and Rhinecliff station. beck village. where his summer home, Ferncliff, issituated. The distance is two miles over a splendid p'ece of roadway. The vehicle has been ordered from a New York company in which Colonel Astor is interested.

# THE TELEPHONE WORLD.

# The Plans of the Telephone, Telegraph & Cable Company of America.

President William J. Latta, of the Telephone, Telegraph & Cable Company of America, has issued a statement to the stockholders relative to the assessment of \$2.50 per share on the company's stock, which is the first official announcement as to the officers and plans of the American Bell Telephone Company's rival.

The directors of the company are Harrison E. Gawtry, Charles W. Morse, William H. Gelshenen, John Jacob Astor, Henry R. Wilson, Frank Tilford, George Crocker, Daniel O'Day, Martin Maloney, Oakes Ames, Z. S. Holbrook, Charles E. Adams, Joseph B. McCall, Hugh J. McGowan, J. Henry Cochran, James E. Hays, William J. Latta and Francis M. Jeneks

After alluding to the recent acquisition of the Erie Telegraph & Telephone Company, President Latta says the company now controls the operation of over 115,000 telephones. A plan has been outlined, he states, by which future assessments will be made in such manner as to impose no hardship, and he expresses the belief that it will not be necessary to call in the balance of the unpaid capital. The stock has been listed on the Philadelphia Exchange.

The competition in the telephone service, which is spreading throughout the country in opposition to the Bell Company will appear in Savannah, Ga., when the Georgia Telephone & Telegraph Company inaugurates its system not later than April 1. The company has operated quietly up to this time and expects to start business under favorable circumstances. The officers are: William A. Bisbee, president; Henry Ban, vice-president; J. Randolph Anderson, secretary; Leopold Adler, treasurer, and R. H. Polk, general superintendent. The directors are: W. A. Bisbee, capitalist; Henry Blun, president Germania Bank; J. Randolph Anderson, lawyer; Leopold Adler, merchant: J. H. Estill, president "Morning News"; W. W. Mackall, president Georgia Construction Company: Jacob Paulsen, president Propeller Towboat Company, and H. P. Smart capitalist. The company's authorized capital is \$200,000. The new company has about 900 subscribers, and the management claims that at least half this number will be connected when its operations begin. Practically all the outside installation is completed, and the work being actively pushed ahead now is the adjustment of the switchboard.

A daily paper is responsible for the statement that the general agent of the Western Electric Company, Col. George T Pratt sailed by the steamer Wassland for London. The object of his visit is to Americanize the English telephone system by the introduction of American methods and American machinery. George Elliott, of the American Bell Company, said recently that "London is really fifteen years be hind the times in its telephone arrangements, and this situation is due to the refusal of the English authorities to grant the highway privileges inseparable from the establishment of a first-class system. Mr. Pratt is going over to install our American plan of operating." The telephone systems in London are almost wholly under the control of the Government, and with that city's enormous population, there are, it is said, only about 10,000 'phones, while in Philadelphia alone, with less than one-third of the population, there are nearly 13,000 in daily use.

The annual meeting of the East Tennessee Telephone Company stockholders was held at Bowling Green, Ky., recently. In the report of Mr. O. F. Noel, president and general manager, it was shown that the company had opened new exchanges during the year 1899 at Athens and Winchester, Tenn., also at Winchester, Ky. Much toll line extension was noted, the most prominent of which was the line from Chattanooga to Tracy City, Tenn., this line being the outlet for East Tennessee for Middle Tennessee and the world. Another important feature of the year's work was the construction of the ninety miles of line between Morristown and Bristol, Tenn., with its lateral to Rogerszille. An election was held, and the following were chosen as directors for the ensuing year: O. F. Noel, J. E. Caldwell, Wm. Litterer, of Nash ville, A. G. Sharp, of Atlanta, and Fred F. Wiehl, of Chattanooga.

The Hudson River Telephone Company has filed a protest with the State Board of Tax Commissioners against the valuation placed upon its franchise in the city of Gloversville, N. Y. The company states that the enforcement of the tax would reduce receipts and result in the abandonment of the line.

Forty-six subscribers have been secured for the telephone exchange in Cambridge, N. Y., and the line will be built as son as spring opens. A quantity of poles have already been bought. The Troy Company will extend its line to Cambridge, making a direct connection with the south.

#### More Trouble for the Bell.

The board of aldermen of Springfield, Mass., voted on the 14th inst. to grant a franchise to the Hampden Automatic Telephone Company.

The action of the aldermen is the first successful attempt to invade the Bell field in Western Massachusetts. The promoters of the new company are confident of securing franchises throughout the county.

### Bell Company's Taxes.

The valuations of the special franchise of the Bell Telephone Company in Buffalo and Rochester were considered by the New York State Board of Tax Commissioners on the 13th inst. The franchise in Buffalo has been valued at \$647,000, and that in Rochester at \$250,000. The company maintains that the former should be reduced to \$306,262 and the latter to \$52,400.

A dispatch from Austin, Texas, to the N. Y. "Commercial," states that the Bell telephone people, who operate in Texas under the name of the Southwestern Telegraph & Telephone Company, are going to have a hard time downing the competition springing up rapidly in the larger cities. An independent company is already in operation in Waco and another will soon be ready for operation in Houston. A franchise has been granted by San Antonio, a city of 60,000. to H. M. Aubrey and associates for the establishment of an independent exchange. Mr. Aubrey has applied to Austin for a similar franchise, and it will be granted. It is understood that Mr. Aubrey represents Ohio capitalists, and that they purpose also to establish independent systems in Fort Worth, Dallas and Galveston, and to connect all those cities with long-distance lines. This competition, it is thought, will cause a general reduction in rates. The new companies charge \$3 per month for a business instrument and \$2 for one in a residence.

The meeting of stockholders of the West Virginia Western Telephone Company concluded its sessions recently with the submitting and acceptance of the report of the general manager of the work performed during the year of the company's existence. The following directors were elected: R. H. Ritherford, C. F. Haddox, J. E. Carle, J. P. Sharp, H. C. Henderson, J. F. Dowd, J. H. Grogg, A. H. Cutright and J. H. Lininger. The new board of directors met after the regular meeting and organized by electing the following officers: President, H. C. Henderson; vice-president, C. F. Haddox; secretary, J. H. Lininger; treasurer, R. H. Rutherford; office manager, A. C. Davis.

The Chicago Telephone Company has declared a cash dividend of 3 per cent, for the first quarter of this year, payable April 5 and a stock dividend of \$1,000,000. Stockholders will be privileged to subscribe for \$500,000 additional stock at par. The stock is now in the neighborhood of 225. Next October there will be a second issue of \$500,000 of new stock at par. The outstanding capital is \$5,000,000, and the distribution of the stock dividend will be in the ratio of one share of new stock for each five shares of old. It is expected that the capital will have to be increased in the future about \$1,000,000 per year to keep pace with the development of the business.

The people of Jefferson City, Mo., see cheaper telephones in sight. The city council has passed an ordinance granting the Capital Telephone Company a franchise to creet and maintain a telephone exchange in that city. This company is not allowed to charge more than \$2 per month for business houses, and \$1 per month for residences, churches, schools, etc. The company is a local organization, composed of Superintendent of Insurance Ed. T. Orear, Assistant Attorney General Sam B. Jeffries, Judge A.M. Hough, Ed. R. Hogg, Dr. J. P. Porth, Houck McHenry and others. It will go to work at once securing subscribers at the reduced rate and expects to have 500 telephones in operation by August 1.

Representatives of independent telephone companies in three States met in Terre-Haute, Ind., on the 6th inst., and effected a permanent organization in opposition to the Bell Telephone Company. The officers elected are Charles R. Duffin, of Terre-Haute, president; J. L. Horney, of Clinton, Ind., vice-president: Henry A. Colt. of Terre-Haute, secretary, and J. B. Connelly, of Rockville, Ind., treasurer. The new company is to be known as the Interstate Telephone Association, and it will start with the independent lines now in operation in Indiana, Illinois and Kentucky.

The reduction in the long distance telephone service rates inaugurated by the New England Telephone & Telegraph Company ranges from 8 to 10 per cent, according to the character of the service. For subscribers living in Boston the reduction is \$12 for a cabinet set, \$18 for a desk stand and \$6 for a wall set, and for subscribers outside the Boston exchange limits the reduction amounts to \$6 per cabinet sets. \$9 for desk stands and \$3 for wall sets.

#### A Long Distance Telephone Line in Africa.

A telephone wire has recently been extended up the Congo from Boma, the capital of the Cree State, to the mouth of the Kwa River, a distance of 450 mlles. Boma is fifty miles from the mouth of the river and Kwamouth, as the station is called, is about one hundred miles above Stanley Pool, whence forty odd steamers, now in service on the upper Congo, start up the river on their various routes, which cover a considerable part of the 7.500 miles of navigable waterways.

At present, owing to the feebleness of the electric current, it is impossible to talk over the wire the whole distance between Boma and Kwamouth. The voices are heard between the two points but the words are not to be distinguished. It is necessary therefore to relay the telephonic messace at Tumba, about two-thirds of the way from Boma. This delays the conversation but very little, and in ten minutes it is found that considerable interchange of remarks may be made between the capital and the up-river station. Every word is distinctly audible with this single break in direct communication.

It is proposed, however, to strengthen the electric current and improve the apparatus, and it is expected that long distance telephoning will soon be as easy a matter on the Congo as it is becoming in the civilized parts of the world. Only two years ago it was impossible to communicate between Boma and Kwamouth in less than twenty days; but in twenty minutes now the Governor at Boma may learn the state of affairs at the up-river station and send his instructions to men in charge of it.

Assemblyman Sullivan has introduced into the Legislature at Albany, N.Y., a bill regulating the rates to be charged for telephone service in various cities. The price in cities of one million inhabitants and over not to exceed \$85 per annum; in cities of 500,000 or less than 1,000,000 not to exceed \$75 per annum; in less than 500,000 not to exceed \$48; in less than 100,000 not to exceed \$36; in cities and places of 8,000 and less than 20,000 not to exceed \$37. He also proposes a charge of ten cents for public pay stations. A court of inquiry consisting of the Comptroller, Attorney General, State Engineer and Surveyor are to have charge of carrying these reforms into effect.

Representatives of 30 West Virginia independent telephone companies met the officers of the National and Unite I States Telephone Companies of Ohio in Parkersburg, W. Va., and made plans for a working arrangement between the independent telephone companies of Illinois, Indiana, Ohio and West Virginia. It was agreed to open the main long distance telephone exchange of the combination in Ohio at Marietta, and that of West Virginia in Parkersburg.

Seventy-five representatives of independent telephone companies of Pennsylvania will meet April 10 at the Lochiel Hotel, Harrisburg, to form the Traffic Association of Independent Telephone Companies, the object being the furtherance of a scheme to establish a long-distance system in the State of Pennsylvania.

The Knickerbocker Telephone Company of this city has leased offices for twenty years in the Astor Building, at Elm and Broome streets, with 13,000 square feet of space, and a switchboard for 5,000 telephones will, it is understood, be placed there.

The question of a telephone line from Raymond to Fremont, N.H., is being discussed, and if the citizens of Fremont will furnish the required guarantee a line will be built at an early date by the New England Telephone Company.

The Central Union Telephone Company and the Pemberville Telephone Companies of Pemberville, O., have consolidated.

#### TELEPHONE INCORPORATIONS.

The Higgins, Lipscomb & Kiowa Telephone Company of Higgins, Texas. Capital stock, \$20,000. Incorporators: A. Winsett, H. J. Holm and W. F. Peugh.

The Ashville Telephone Company, Raleigh, N. C. Capital stock, \$80,000. Incorporators: Charity Rusk Craig, Harlan P. Proctor, W. S. Proctor, E. R. Craig and Lycurgus J. Rusk.

The Union Telephone Company, Rockland, N. Y. Capital stock, \$5,000. Incorporators: F. E. Burkett, H. L. Robbins, L. M. Burkett and A. S. Littlefield.

The Havana Telephone Company, incorporated in Trenton, N. J., to operate telephone and telegraph lines in Cuba and the West Indies. Capital stock, \$500,000 Incorporators: William J. Patterson, Edmund G. Vaughan, Edgar Park and Frank C. Prest.

The Madison and Onondaga Telephone & Telegraph Company—to operate in villages of Onondaga and Madison counties of New York State. Capital stock, \$30,000. Incorporators: Frank E. Dawley and Ellis Woodworth.

# SECURITIES. ECTRICAL

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by Electricity from a variety of sources The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

# NOTES FOR INVESTORS.

Late quotations for copper are : Electrolytic, 152@16c.; Lake, 162@162c.; casting, 152@.152c.

Local capitalists are said to have bought out the Edison and Westinghouse interests in the Electric Illuminating Company of Cumberland, Md.

The United Traction and Electric Company of Jersey City, N. J., has declared a dividend of 1 per cent., payable April 2. Books closed March 20 and reopen April 3.

Contractor John B. McDonald's life has been insured for \$2,000,000 by August Belmont, the head of the syndicate which will finance the construction of the rapid-transit tunnel in New York.

The Westinghouse Electric and Manufacturing Company has declared a quarterly dividend of 13 per cent. on its preferred stock, payable April 2. Books close March 24 and reopen on April 3.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 17@20; New York Electric Vehicle Transportation, 74@8; New England Transportation, 54@6.

The Amalgamated Copper Mining Company has declared the regular quarterly dividend of 1½ per cent. and an extra dividend of ½ per cent., payable April 30. Books close March 26 and reopen May 1.

Shortly before the close of the Stock Exchange in New York on Monday the failure of A. M. Hunter, of No. 52 Broadway, was announced. The failure, it was said, was due to the squeeze in local traction stocks.

The Appellate Division of the Supreme Court has affirmed two judgments aggregating \$56,100 against the Manhattan Elevated Railway Company for loss of value in favor of a property holder on Sixth avenue, of this city, due to the elevated railway structure.

At a maeing of the board of directors of the Telephone, Telegraph and Cable Company of America in this city on the 14th inst., the following executive committee was appointed: William J. Latta, ex-officio, Martin Maloney, Charles W. Morse, Daniel O'Day, and Charles E. Adams.

United States production of copper (long tons) for February, 1900. aggregated 20,897 tons compared with 21,013 tons for the previous month and 19,889 tons February, 1899. Exports of copper from the United States (long tons) for February, 1900, aggregated 12 749 tons compared with 14,035 the previous month, and 8,391 tons, February, 1899.

According to a report submitted to the Stockholders of the Easton Consolidated Electric Company of Easton, Pa., for the seven months ended December 31, 1899, the net earnings were in excess of \$60,000. This concern is a consolidation of the Eastern Transit Company, the Edison Illuminating Company of Easton, and the Easton, Palmer & Bethlehem Street Railway Company.

The Third Avenue Railroad Company of Naw York has passed into the control of the Metropolitan Street Railway Company. The receivership will be wound up as soon as possible. President Vreeland, of the Metropolitan, made the official announcement yesterday. Monday Third Avenue Stock leaped from 66½ to 85½ and as we go to press (Tucsday afternoon) the stock is quoted at 95½.

The syndicate which is after all the electric railways in and about Worcester, Mass., has taken up its options on four more. The owners of the Worcester Traction Company and others are back of the deal. The plan is to unite all the roads under one management There will be big savings in superintendents' salaries and in other ways. The combined capital of the four just taken is \$500,000.

The report of the Brooklyn Haights Railroad Company of Brooklyn, N. Y., for the quarter ended Dacember 31, 1899, which contains the results of the oparations of all the railroads in the Brooklyn Rapid Transit system, and which exhibits a surplus of \$17,052 for the quarter, shows that the Brooklyn Rapid Transit Company earned just \$93,736 38 profit on the oparations of all of its roads for the first six months of its present fiscal year, covering the period from June 30 to Dacember 31, 1899.

The Chicago Telephone Company has declared a cash dividend of 3 per cent. for the first quarter of this year and a stock dividend of \$1,000,000. Stockholders will be privileged to subscribe for \$5,00,000 additional stock at par. The stock is now in the neighborhood of 225. Next Ostober there will be a second issue of \$500,000 of new stock at par. The outstanding capital is \$5,000,000, and the distribution of the stock dividend will be in the ratio of one share of new stock for each five shares of old.

At a special meeting of the stockholders of the Western Union Telegraph Company on the 14th inst. the proposed issue of \$20,000,000 of 4½ per cent. refunding fifty year bonds was approved by a two-thirds vote. Directors of the company met later and declared the regular quarterly dividend of 1½ per cent. The report for the quarter ended Ottober 1, 1899, shows a surplus of \$8,292,383.16, with net revenues during that period of \$1,579,486.58. On January 1 of this year the company had a surplus of \$8,430,753 61.

In Boston on Monday, Judges Putnam, Aldrich and Brown, of the United States Circuit Court of Appeals for the First District, handed down a decision in the case of the Electric Storage Battery Company against the Hatch Storage Battery Company, affirming the decision of Circuit Judge Colt, wherein the Hatch Battery was held to be an infringement of the Brush patent. This is the most substantial legal victory ever won by the Electric Storage Battery Company and means the continuation of its monopoly in modern storage batteries.

A mortgage for \$1.000,000, given by the Rochester Gas and Electric Company to the Security Trust Company of Richester, N. Y., was filed on the 15th inst, with the County Clerk. It was given to secure \$1.000,000 of 4½ per cent. gold bonds designed to refund \$310,000 of 5 per cent. second mortgage bonds, maturing on March 15, 1902, and to provide for the extension of the company's plant. The bonds are for \$1,000 each, with interest payable March 15 and September 16. The company reserves the right to retire any or all of the bonds on March 15, 1910, or on any other semi-annual interest day.

As we go to press a dispatch from Boston says that "the consolidation of the American Bell Telephone Company with the American Telephone and Telegraph Company of New York is confirmed through the issuance of a call for the annual stockholders' meeting of the Bill Company to be held in Boston March 27. The call announces that the stockholders will be asked to authorize the conveyance of the company's entire real estate, ratifying the assignment to the American Telephone and Telegraph Company of the property of the company other than the company's Long Dis ance stock and distributing the shares of the Long Distance Company in exchange for the stock of the Bell Company."

The uncertainty converted with the method to be presented by the Metapolitan

Company in exchange for the stock of the Bell Company."

The uncertainty connected with the method to be pursued by the Metropolitan Street Railway Company of New York City in providing cash for its proposed improvements and extensions, has had a depressing effect upon the stock in the market. It has been officially announced that \$10,000,000 will be expended upon the property. Should this be provided for by an issue of new stock, the charge upon the property at the present rate of dividends would be \$700,000 per annum. On the other hand the selling of bonds which would not bear interest at less than 5 percent, would make an increased fixed charge of \$500,000. No definite action will be taken immediately and one proposition under consideration is the issue of \$5,000,000 of stock and \$5,000,000 new bonds, which would make \$600,000 additional or the company to pay yearly.

# EDITORIAL NOTES.

#### A Mecca for Electrical Workers.

During the next three or four years there is to be an immense amount of

money expended in New York City and vicinity that should materially benefit the electrical industry.

Last Saturday the first spade full of dirt was formally turned up near the City Hall, which marked the beginning of an undertaking involving the expenditure of some \$35,000,-000, a portion of which amount will ultimately find its way into the pockets of electrical manufacturers and electrical workers. Aside from the \$16,000,000 which it is estimated will be put in circulation for labor, and the \$12,000,000, which will go to rolling mills and quarry owners, before the underground road is ready for travel, two or three millions at least will have to be expended for electrical machinery and apparatus. A power station will be built, innumerable motors will be required, especially if, as is now thought probable, the multiple-unit system of propulsion is adopted, while thousands of electric lamps will have to be installed for illuminating the tunnels and the stations. Add to the above, electrical signaling devices, and some fair idea may be had of the immense demand there will be for electrical workers and electrical apparatus.

But the undergound rapid transit system is by no means the only large project in this vicinity that will afford electrical manufacturers and workers an opportunity to turn an honest penny. During the next fifteen months the motive power on the elevated roads of this city will in all probability be changed from steam to electricity, which will involve an expenditure of several million dollars, while only recently it was announced that the Metropolitan Traction Company proposed shortly to expend \$8,000,000 in substituting electricity for the cable on some twenty-five miles of its lines. Of course by no means all of the eight million will find its way into the hands of the electrical fraternity, but it is pretty safe to assert that one-quarter to onefifth of this sum will go for electrical equipment, feeder cables, etc. To these projects should be added that of completing the electrical equipment of some of the Third Avenue Railroad Company's lines, which will undoubtedly be carried out under the new regimé,

added to the fact that in all probability before the present proposed rapid transit tunnel is completed another tunnel to connect with it from Brooklyn will have been started, would certainly lead one to believe that, at least so far as New York City and vicinity is concerned, the outlook for electrical workers and manufacturers is most encouraging. It is not often that undertakings requiring an outlay of eight or ten million dollars for electrical apparatus and machinery are started up almost simultaneously in one locality.

# \*

## The Economy of **Electric Motors** Over Shafting.

In spite of much misplaced conservatism electric motors are fast replacing shafting and belts in paper

mills, printing establishments, machine shops and in the driving of cotton mill machinery. That the direct application of power to the various machines to be operated by means of electric motors has much to recommend it we have several times pointed out in these columns, but, like every innovation, mill and shop owners have been slow to discard the old type of apparatus, each apparently preferring that his neighbor should be the one to take the first step in a seemingly untrodden field. To a certain extent it was a case of "what was good enough for my father is good enough for me" in fact the same stereotyped cry that has probably done more to keep many countries fifty years behind the times than anything else.

Of late, however, many shops and mills have been obliged to do away with belts and shafting in self-defense. Rivals in their line of business started up with new plants embodying the latest type of machinery and apparatus, with the result that conservative old-timers found their business dwindling away through competition. In other words, they were being undersold. An examination into the matter usually revealed the fact that with the old type of plant it required a consumption of about one-third more coal for the same output. This discovery, as may be imagined, had a bad effect on conservatism, with the result that the old plant was speedily renovated and antiquated lines of shafting and belting discarded in favor of electric motors. Referring to this subject "Cassier's Magazine" for April will

say:
"All experience thus far with electric power for shop service has gone towards establishing the fact that electric motor installations are

money savers. The friction of long lines of main shafting and sometimes of subsidiary shafting is avoided, and this, as has become well known, represents a very substantial portion of the total power ordinarily consumed. With its elimination, the power required to operate an establishment has been known to come down to astonishingly low figures, in one recorded instance being only about 26 per cent. of the actual rated motor equipment of the shop, while in another it barely exceeded 15 per cent. of the shop capacity, even though in this the power necessary for an electric crane had been included, and that required for lighting."

As we have pointed out several times no matter how well the shafting in a shop or mill is aligned or how carefully the apparatus is kept oiled there is always a loss through friction of from 45 to 50 per cent. Moreover, when in a shop a large number of separate machines are driven from one line of shafting an enormous amount of power is necessarily wasted owing to the intermittent nature of the work performed by the various tools or machines.

The advantage of electric motors in cases of this kind is clearly shown in the article already referred to, which says:

"In the extensive establishment of the Baldwin Locomotive Works at Philadelphia, with electric motors in service requiring collectively 3,500 horse power, the generator capacity provided is only 1.550 horse power, and of this, too, a 250 hp, unit is kept in reserve, leaving only 1,300 horse power in service. Of the motor equipment 400 horse power is said to be constantly idle or undergoing repairs, so that the final proportion is 1,300 hp. in the generators to 3,100 in the motors, or about 1:2.4 According to one authority, one-third of the rated motor capacity will usually be ample for the generator capacity in large plants; according to another, one-sixth has been found sufficient. These proportions obviously require qualification for different conditions, but they all help to bear out the truth of the original proposition as to the economy of the new order of things."

That it is an economy is rapidly being appreciated, not only in almost every line of industry in this country, but by conservative European manufacturers as well.

\* \* \*

Suggestions as to the Prevention of Electrolysis. The destruction of water pipes by electrolysis continues apace, and from many parts of the

country come cries of anguish mingled with imprecations against the local trolley companies. In some localities the Water Commissioners are endeavoring to force the street railway companies to compensate them for the damage done, at the same time insisting that steps shall be immediately taken to prevent return currents straying into the ground. Wilmington, Del., is one of the localities where at present legal steps are being taken to compel the City Railway Company to pay for the ravages of stray currents on water pipes. In Wilmington it is not only the money represented in damages that the Water Commissioners desire to recover, but it is their wish to obtain a precedent to govern such cases in the future.

Rochester, in this State, is another city that is suffering from the same complaint, but unlike Wilmington, no definite action has as yet been taken nor an electrical survey made. Numerous other places could be named where

the local water-works system is suffering through electrolytic action, in each one of which the invariable query is "How can it be prevented?"

In the last issue of "City Government," Emil Kuichling, formerly chief engineer of the Rochester Water Works, endeavors to answer this question, and among other things says:

"1. Improvement of the railway tracks by providing heavier rails, more effective bonds at the rail joints, and larger return feeders. This plan is receiving the most attention at the present time, and has been pursued to some extent by the Rochester Railway Company. The opinion is, however, generally entertained that this remedy only moderates in some degree the danger to the underground pipes.

"2. Efficient bonding between the rails and track return system and the various underground pipes, cable sheaths, etc., at numerous points within the danger area, so as to make all of these elements direct return conductors. The difficulty with this plan is the probable danger to the pipe joints by the large currents of electricity that may thereby be transmitted through them under different conditions of operating the street cars, and the consequent variability of the limits of the danger area. It may also become a strong temptation to the railway company to neglect further improvement of the track return system, and to depend entirely upon the underground pipes as return conductors. This method may accordingly be left out of consideration unless it is kept under the closest surveillance of an expert.

"3 The provision at the railway power station of auxiliary generators, whose negative poles connected to the underground pipes alone by suitable wires, and which by being operated constantly under a higher potential than the generators connected with the track return system, tend to exhaust the current more rapidly from the pipes than it is taken from the track return system, thus keeping the pipes negative to the rails at all times and places. It is also understood that no direct connections whatever are here to be made between the rails and the pipes, and that the latter shall receive only the smallest practical quantity of spent current by constructing the tracks in the best manner throughout. This plan appears to be both rational and effective, although not yet extensively used. It is, however, subject to the same objections named in the preceding paragraph."

This question of devising means for preventing electrolysis has been discussed over and over again before the various electrical and engineering societies of this country, and sad to relate, although the matter has been given careful thought by probably some of the best minds in the world, no sure or really satisfactory electrolysis preventative has been forthcoming.

The third method referred to by Mr. Kuichling, or rather a modification of it, namely, that of running a large conductor from the grounded side of the dynamo or dynamos in the power station through the danger territory, and connecting it at intervals to such pipes as are positive to the rails, is probably the most satisfactory yet brought out, although even this arrangement leaves much to be desired. When, however, the rails of a single-wire overhead trolley system are electrically welded in place, forming a continuous return, and this is supplemented by the arrangement just described, there is little doubt but what the

danger to water pipes through electrolysis is reduced to a minimum.

\* \* \*

Another Stockjobbing Canard. The following dispatch was published in the Boston "News Bureau" on Friday, March 23, and of course had its origin in

Wall Street—the transposing of the firm name showing the fine work of a schemer:

N. Y.—The Halske-Siemens Electrical Company is to go out of business. This will divide the electrical territory pretty thoroughly between the Westinghouse and the General Electric Companies with enormous profits for each. Quiet buying of General Electric has been noticed in the market the past few days.

A representative of ELECTRICITY with the above clipping was sent to the New York office of Siemens & Halske to obtain a verification of the report and the manager immediately called up President Lloyd, of the Siemens & Halske Company in Chicago, on the telephone. Mr. Lloyd, after the dispatch had been read to him, pronounced it a base fabrication, said that there was not a particle of ground for the report, and that it was published solely for stockjobbing purposes.

Of course the publication of the false statement sent a leading electrical stock up three points and allowed the "rumor mongers" an opportunity to "take a flyer in the market."

# UNDER THE SEARCHLIGHT.

#### Notes and Comments on Various Topics.

Mr. W. J. Johnston, formerly editor of the "Electrical World," writes that he arrived at Colombo, Ceylon, February 15. From there he goes to Calcutta and thence across India to Bombay.

ACCORDING to a statement the development of electrical traction railways in Mexico has been so rapid that second-hand cars from this country, replaced here by better patterns, are eagerly sought for.

The Equitable Life Assurance Society of the United States will have an exhibit at the Paris Exposition which will reflect great credit not only on that company, but upon American ingenuity generally, as the most striking feature of the exhibit will be an American electrical display representing the marvelous growth of American life insurance. For this purpose fac-similes of the Statue of Liberty in New York harbor, the Eiffel Tower, Arc de Triomphe and other objects of interest, both in America and France, will be represented in vari-colored electric lights.

M. MERCADIER, a French inventor, claims to have solved the problem of sending a number of dispatches simultaneously on a single wire. His system, which was explained last week before the Academy of Sciences in Paris, was recently tried successfully between Paris and Pau. Twelve independent currents were sent on the circuit at once, and in each direction, making a total of twenty-four telegrams.

Some encouraging facts in regard to American industries abroad have recently been shown. The British Government has ordered 150 type-writing machines from an American company, the largest order it ever gave to any company, British or American. The English Northeastern Railway Company has been placing orders for locomotives in the United States

and an American company has secured a contract to furnish the Bedford (England) Electrical Light Committee with nearly all of its machinery. American locomotives have been subjected to severe trials in Bavaria, and the Prussian Minister of Railways officially reports that "notwithstanding their faultless construction they cost considerably less than locomotives of similar style of Prussian make."

THE State Department at Washington received a telegram from Richard T. Greener, United States Consul at Vladivostock, the eastern terminus of the Trans-Siberian Railway, that estimates had been prepared for the construction there of an electric trolley tramway 20 miles long, electric lights and waterworks, and that proposals were desired from the United States.

The rebuilding of Timber Dry Dock No. 2 at the Brooklyn Navy Yard has progressed so far that the department of yards and docks have asked for bids for the new steel caisson, which is to be used in place of the old one. Bids will be opened March 31. The new caisson will be of an improved type equipped with electric machinery instead of an engine and boiler, as are used in the other caissons about dry docks owned by the Government. The new caisson will cost between \$40,000 and \$50,000. Although the new entrance to the dock will be of the same size as that of the old one, the caisson which is now in use will be discarded.

F. A. EMBRSON, assistant postmaster, in Cleveland, O., has evolved a novel scheme for providing a pneumatic tube for carrying mail between the post office and the Union depot. Mr. Emerson proposes to use the cable conduit of the Superior street line of the Little Consolidated road in which to place the pneumatic tube. The street railway expects to abandon its cable power and substitute electricity as a motive power next summer, and if it does so the conduit will be useless as far as the railroad is concerned.

ONE of the latest devices is a rocking electric bath tub. The top is covered with a water-proof apron that fits around the neck of the bather, while an electric current is made to pass through the water between two copper electrodes. The whole arrangement is pivoted so that a rocking motion may be imparted to it by the bather if desired.

In a recent issue of "L'Electricien" there appears a table showing the growth of electric street railways in the principal countries of Europe during the past four years. Germany leads the list with a length of 250 miles of electric railways in 1896, which in 1899 had in creased to 2,160 miles. Austria-Hungary comes next with a length of 45 miles in 1896 and 600 miles in 1899. The third place is taken by the United Kingdom, the figures being 67 miles in 1896 and 600 miles in 1899. The next countries in order are Italy, France, Switzerland, Russia, Belgium, etc.

A SALE of condemned stores will be held at the Brooklyn Navy Yard during the first part of May. They will consist of cloth, old iron, instruments and electrical appliances, some of which were in the recent fire at the yard. It is expected that there will be over one hundred bidders, and a classified list will be issued by the Paymaster's Department before the sale, which will be advertised for thirty days, according to the regulations.

From all accounts a severe coal famine is being experienced in Europe. This is especially so in Russia and Germany. In the latter country as many as a dozen electric lighting and power plants have but a very limited supply of fuel on hand, which will necessitate their shutting down in the course of a few weeks unless coal can be obtained from some unknown source.

It is officially stated that the total length of railways in France working on December 31 last was 26,522 English miles. There were in addition 2,338 miles of electric railways.

HARRY LONG, of Greentown, Ind., writes "that he has been granted letters patent on a new invention known as an electric lamp support. Through this device it is claimed that it will be impossible for men to receive a shock while placing carbons in arc lamps."

The Rapid Transit Commission of New York is now giving serious consideration to the question of constructing pipe galleries at the same time its tunnel work is going on. These galleries are for carrying gas, water and sewer pipes and conduits for wires. The conduits carrying the electric wires of private corporations for power and heat and other things, as well as piping generally could, it is thought, be made a very considerable source of revenue.

THE Nernst lamp has now been so perfected that the engineers of the German company are going to subject it to the test of commercial usage, When Prince Albert, of Prussia, went to celebrate the opening of the "Twentieth Century" at the University of Gottingen, his apartments were lighted with Nernst lamps. Now the lamp is being advertised in Gottingen for house and store lighting. The lamps are rented for 12 cents (50 pfennigs) a month and will remain the property of the company. The lamps are to be used on the regular commercial 110-volt circuit and require about 0.3 ampere for 25 cp. The company supplies an alcohol heater and expressly forbids the use of matches.

THE important part that electricity will play in the modern house, says the N. Y. "World," is shown for the first time in the equipment of "Villa Julia," the magnificent residence Isaac S. Rice is building on Riverside Drive, New York. One of the new features of this up-to-date home will be an automobile room, and in addition there will be arrangements for lighting, heating, cooking, washing, ironing, drying clothes, ventilation, electric fans, elevator, sewing machines, bells, fire alarm, telephone, phonographs and kinetoscopes, all by electricity. Mr. Rice is an automobile enthusiast. He has devoted considerable space in his \$1,000,000 house to his carriages, and has arranged to have a connecting wire from the Edison Company, and will charge his own vehicles. While it has been the fashion in Paris for several years to have an auto-room in a dwelling, Mr. Rice's home is probably the first one in this city to contain this feature.

According to an English journal, the amount of money invested in the electrical industries of Great Britain closely approaches \$500,000,000. Of this amount, about \$170,000,000 are invested in telegraphs, electric traction claims \$100,000,000, electrical manufacturing concerns about \$80,000,000, electricity supply by municipalities about \$41,000,000, electrochemical and miscellaneous industries about \$40,000,000, and telephony about \$38,000,000.

In a lecture last week before the Knickerbocker Athletic Club of this city, Mr. Hiram P. Maxim, referring to automobiles, among other things said that the advantages of the electric machine were extreme "sweetness" of movement, elegance and simplicity of operation and control. Their disadvantages were the short mileage permissible, their weight and their cost. He thought, however, that the greatest development would take place in electric automobiles of all others. Gasoline machines are favored for their lightness, speed and 'unlimited distance of travel. The public, however, was not yet "up to" their operation fully, and was inclined to see first their defects, particularly that of shaking when not in transit.

A Massachusetts chemist has just patented a copper coating for protecting the hulls of steel and iron ships against the accumulation of marine growth and galvanic action. The new copper coat is impervious to water and is applied over a special quality of red oxide. The latter is hermetically sealed by the coating and thereby strongly protects the plating of the ship. The new coating is applied after the manner of paint. It is composed of three metals and will, it is claimed, last for seven years with occasional docking and repairing of the ship to which it is applied.

On March 10 Mr. Marconi gave a demonstration of his system of wireless telegraphy before the King of the Belgians. The instruments were placed in rooms about 500 feet apart, and the signals had to traverse thick walls. All the messages, including one written by the King, were most satisfactorily transmitted. An English daily paper states that his Majesty has promised to support the adoption of the system in Belgium generally and in the Belgian army particularly.

The first test of the automobile which is to represent this country in the long distance automobile race for the International Cup in France on June 14 next was made in Cleveland last week over a long stretch of the Cleveland Boulevard. Mr. Alexander Winton, inventor of the machine, was at the lever, and he said that his first test, while made under rather unfavorable conditions, appeared to him satisfactory, and that while he would make no claims of any character for the American challenger, he felt that he was justified in announcing that it had in every way met his expectations.

According to a contemporary the wellknown Italian inventor, Dr. D. Tommassi, has devised an ingenious cartridge for mining and blasting purposes, which is said to be entirely inexplosive, and safe until its contents are electrolyzed by the passage of a current through them. The cartridge is a stout glass tube, containing a platinum wire sealed in at each end, and is filled with a concentrated solution of ammonium chloride. When this perfectly inert substance is electrolyzed by the passage of a current through it, it decomposes into chlorine, ammonia and hydrogen. The chlorine reacts upon the ammonia and decomposes it with the formation of hydrochloric acid and chloride of nitrogen. When the gases disengaged attain a sufficient pressure the tube bursts, and the shock resulting from this action detonates the chloride of nitrogen, which, as is well known, is one of the most violent of explosive substances.

## BECQUEREL RAYS.\*

If it had not been for the previous discovery of the Roentgen rays, the discovery of the Becquerel rays would have been looked upon as the most remarkable scientific event of the century. These rays have many of the now well-known properties of the Roentgen rays, but in their origin they are unique, since they appear to contravene the law of the conservation of energy and realize the popular ideal of creation of something out of nothing.

A photographic effect, due to the presence of sulphide of zinc, was observed by Henry in 1896, but he supposed that the effect was due to a transformation of the Roentgen rays to which the sulphide of zinc was at the time exposed. Becquerel was the first to show that the photographic effect was due to radiation proceeding from the substance itself, even when the Roentgen rays were not present, and he also showed that a great many other substances besides sulphide of zinc emitted this peculiar kind of radiation. These rays are, therefore, properly named after the real discoverer, Becquerel.

The Becquerel rays, like the Roentgen rays, have the property of passing through all substances, whether opaque or not, the absorption

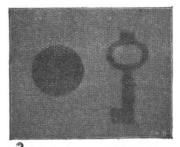

Fig. 1.

being proportional to the specific weight of the substances. Fig. 1, for instance, is a diagraph of a key and coin enclosed in a cardboard box, obtained by exposure to the Becquerel rays. The result is much the same as would be produced by the Roentgen rays; the exposure required is longer, and the outlines are not so sharp, especially if, as in the case of the key, the object is some distance above the photographic plate.

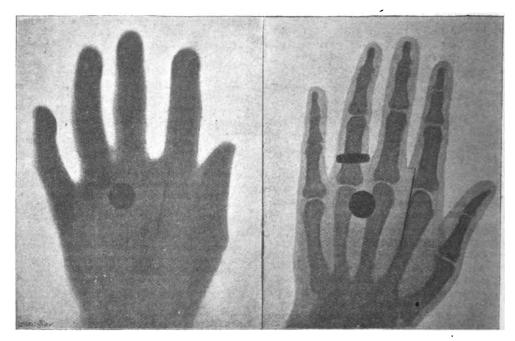

The substances which Becquerel first employed to produce this radiation were the phosphorescent compounds of uranium, that metal which, of all the chemical elements, has the highest atomic weight. Later he found that non-phosphorescent compounds of this metal emitted more or less strong rays of the same kind, and he came to the conclusion that the radiation was probably due to the presence of the metal, and that the pure metal would emit more powerful radiation than any of its compounds. This expectation was fulfilled, and Becquerel on that account called the new radiation "Uranium rays," a name which, however, can hardly be justified, as other substances not containing uranium have since been found. which are even stronger radiators. Of such substances may be mentioned thorium, which comes next to uranium in atomic weight, and is well known as forming an essential constituent of the mantle of the Welsbach gas light.

The discovery of this property of thorium and its compounds was independently made by Schmidt, of Erlangen, and Madame Curie, of

Paris, a lady who soon after distinguished herself by making further discoveries in this field. We have her to thank, especially, for the discovery of two entirely new groups of preparations, whose Becquerel radiation is some hundred times stronger than that of the uranium and thorium compounds previously known. While comparing the strength of the radiation of uranium and thorium compounds, Madame Curie discovered that Bohemian pitch-blende, an uranium ore, had a much stronger action than uranium itself, and in view of Becquerel's investigations, this could only be accounted for by the presence in the ore with the uranium of another more active element. By fractional analysis of the pitch-blende, the most active constituents were gradually isolated, and there turned out to be two such products in the ore. Chemical analysis showed that these two products were compounds of bismuth and barium respectively, but with this difference that the same compounds obtained in other ways did not emit Becquerel rays. The products were looked upon by their discoverer as two new elements, and were named by her "Polonium," and "Radium." The probability, however, is replacing the costly apparatus for the production of Roentgen rays, by a small tube charged with one of these preparations. This question is of especial interest to medical men, and it has recently been thoroughly investigated by Dr. Walter, of Hamburg.

Both the De Haen and the Giesel preparations are capable of exciting the barium platinocyanide phosphorescent screen. The effect is very much weaker than with the Roentgen rays, but with the Giesel preparation the phosphorescence is distinctly visible at a distance of 20 cm. A shadow picture of the human hand can be obtained, but only the outline of the hand is seen, the bones are invisible. Even when the photographic plate is used, the bones are not shown, as may be seen by comparing Figs. 2 and 3. Fig. 3 is taken with the Roentgen rays, Fig. 2 is a photograph of the same hand taken by an exposure of an hour to the strongest Giesel preparation. The bones are invisible in the second case; a needle and coin placed under the hand are visible, but indistinct compared with the Roentgen photograph.

These results dispel all hope of using the radio-active substances for obtaining diagraphs

F1G. 2.

that they are merely allotropic forms of compounds of bismuth and barium; but judgment for the present must be suspended on the question of their elementary character. It has been proposed by Giesel to call them simply "radio-active bismuth," and "radio-active barium."

Giesel, of Brunswick, with the assistance of the well-known physicists, Elster and Geitel, has succeeded at the chemical factory of A. de Haen of List, near Hanover, in making concentrated preparations of the substances discovered by Madame Curie, which far exceed in radio-activity anything that has hitherto been produced. The most powerful substance obtained by Giesel requires that some hundredweights of the ore should be used for the production of a few grams, which of course, makes its cost prohibitive for professional or commercial use, but the De Haen factory manufactures an intermediate product which, though not quite so powerful, can be had at a moderate price.

The immense improvements that have been made in radio-active substances by these investigations has suggested the possibility of

Fig. 3.

of parts of the human body. Walter's investigation leads to the conclusion that the failure of the Becquerel rays to depict the interior parts of opaque bodies is due to their greater diffusion, and to their exciting secondary radiations in the substances through which they pass. The secondary radiations act on the photographic plate and obscure the outlines of the interior forms.

Though Walter's investigations lead to a negative result, they are not the less valuable in preventing users of the Roentgen rays being misled by the many similarities of the Becquerel rays and the X-rays into the belief that the latter can in every case replace the former.

# An Electric Water Filter.

An electrical water filter has recently been brought out, consisting among other things of a tube in which are placed two electrodes. The water in passing from one compartment to another is obliged to circulate through this tube when, according to the inventors, it is purified by being partially decomposed by the electric current into oxygen, hydrogen and by the formation of ozone.

From the "Electrical Review," London.

#### UNION TRACTION PLANT AT PHILADEL-PHIA

BY FRANK C. PERKINS.

The Union Traction Company of Philadelphia have a total length of track of about 450 miles and operate over 3,000 cars. Mr. J. B. Parsons is president and general manager, and C. O. Kruger secretary and treasurer. This company has absorbed practically all the lines in and about the city of Philadelphia, and is now one of the largest systems of street railway lines in the United States. The total power used is in the neighborhood of 40,000 horse power, and is supplied from nearly a dozen stations operating over 30 generators.

The accompanying illustration shows two of the four 1,500 kilowatt direct connected engine type generators in the Mount Vernon street station. This station is in the heart of the city in the busiest section, and continually has a very heavy load.

The generators supply a current of 2,730 amperes at the usual street railway feeder voltage, and operate at a speed of from 75 to

The field castings are divided vertically and set upon a guide plate. The vertical division of the fields affords an excellent facility for immediate inspection or removal of armature or field coils without the necessity of removing the outboard bearing or dismantling the engine. The opening of the fields upon ways in a horizontal direction is a great convenience where head room is limited and cranes or other devices for handling heavy castings are not available.

The armature winding is of interest, and is arranged as follows: The periphery of the armature is slotted. The armature windings are made from bars of drawn copper, forged into proper shape on cast iron formers. After being thus shaped the bars are thoroughly insulated with mica, and prepared fuller-board, and baked to remove all moisture. The coils are held in the slots by means of retaining wedges of hard fiber driven into notches near the top of the slots, parallel with the engine shaft. These fiber wedges can be pressed out should it become necessary to remove any armature coil.

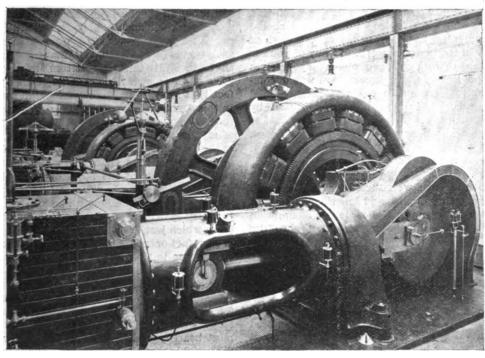

FIG. 1.—ENGINE TYPE GENERATOR OF UNION TRACTION PLANT AT PHILADELPHIA.

80 revolutions per minute. They have a total weight of about 100 tons, and are of the 14 pole type. The field coils are over-compounded to raise the potential as the load increases a total of 10 per cent. The field coils, both series and shunt, are removable when desired, and the series coils are composed of forged copper conductors of rectangular cross section.

The armature core consists of punched sheets of carefully laminated steel, held together by cast steel end plates. This core is built upon an iron spider, and also carries the commutator. The spider is pressed and keyed upon the shaft of the engine, and may be taken off at will should there be any reason to do so, without in any way interfering with the permanent arrangement of the commutator and windings. Ventilating spaces through the spider and armature core are so arranged as to allow a constant circulation of air through the commutator and windings when the machine is running. The general design of these engine type generators is similar to that of the regular multipolar machines, and consists of a circular yoke carrying inwardly projecting pole pieces of laminated soft steel.

The weight of the two main engine bearings is equalized, and the commutator protected from dirt and grease by reversing the ordinary practice and placing on the commutator next to fly wheel.

The switchboard is a double bank, and has tive panels for generators, several instrument panels, and over seventy feeder panels. The bus-bars are arranged so that the total number of feeders may be supplied with current from the four 1,500 kw. engine type generators, shown in the illustration.

The boilers have a capacity of over 7,000 hp., are of the water tubular type, and have an available pressure of 150 lbs. The engines are compound condensing, and drive the generators at 75 to 80 revolutions per minute.

In the motor equipment both single and double trucks are used. Electric heaters are to be found in the cars, of which there are a total of 3,000. The 33d and Market street station also have two 1,500 kilowatt engine type 14 pole generators, and several smaller machines of about 400 kilowatt capacity. Several generators of about 500 kw. capacity are in use at 32d and Dauphin streets,

and at North Delaware avenue. The Willow Grove power house has several belted machines of smaller sizes, and the future equipment will undoubtedly be of the more modern type of construction.

The storage battery equipment of the Union Traction Company of Philadelphia was originally installed at the Chestnut Hill station, and gave excellent satisfaction as a pressure regulator. The battery consisted of 248 chloride accumulators. Each cell had six positives and seven negatives, 15½ inches square, in leadlined tanks. No mechanical connections were used, the plates being lead burned to lead busbars. The cells were installed in two rows on oil insulators upon the tile floor of the battery room. The maximum discharge rate as originally installed was 400 hp. for one hour. The switchboard apparatus controlling the entire operation of the battery, feeder and line, consists of ammeter, circuit breaker and knife switch, in each of three circuits; also the usual voltmeter and recording wattmeters in the battery circuit.

# THE NORTHERN SOCIETY OF ELECTRICAL ENGINEERS.

Abstract of the Inaugural Address of Dr. Ed. Hopkinson, Delivered at Manchester, England, February 27, 1900.

Electrical engineering, though in a sense the most specialized of all branches of engineering, is really the most cosmopolitan, depending upon many branches of fine scientific-mathematics, the whole range of physics, chemistry, and even to some extent the biological sciences, and playing an integral part throughout the vast field of engineering, so that the choice of a subject is a matter of no little difficulty.

English electrical engineering has been, and is, passing through a momentous epoch of its history. Before recovering from a strike of unprecedented length and extent, a period of extraordinary expansion in the general trade of the country, and quite sudden realization by the public of the advantages of electric lighting, electric traction, electric transmission, and distribution of power, and many other applications of electric energy, had led to great demands on both manufacturers and undertakers, for which it cannot be said they have by any means been fully prepared, with the result that large orders for electrical plant have been placed abroad.

Let us take it for granted, for a moment only, for the sake of argument, and we will return to the assumption later, that the conditions in England are generally as favorable for manufacture as they are in other countries; then it is obvious that undertakers, including under the term more particularly municipalities and public companies, who are undertakers in the parliamentary sense of the word, ought not to deprive their own rate payers and constituents of work and order abroad, except by reason of inability of otherwise obtaining delivery in reasonable time or of serious difference in price. Primarily dependent, as they are, for their own prosperity upon the full employment of the working classes of this country, they cannot regard with indifference the passing of any work out of the country which can be done in it; nor can they throw the odium of unpreparedness entirely upon the manufacturers, as it is, I venture to think, as much their business and their interest to so forecast the future as to take such steps for increase of their plant to afford ample time for properly digested plans of extensions, and for the execution of the work, as it is the business of the manufacturer to provide the appliances for construction. Would the nation relieve the Admiralty or war office of responsibility if they suddenly found that they wanted ships and guns with such rapidity and in such quantity that they had to buy in Germany? Would it not rather hold that the departments had shown lack of foresight and due preparation?

I asked you a moment ago to grant, for the sake of argument, that the conditions in England are generally as favorable as in other countries. Are they? a large question with many answers. In one respect it must be admitted they are. English manufacturers find no inducement either in price or in quality to buy their coal, iron or steel, except in relatively infinitesimal quantities from abroad. But are our conditions of labor and our capabilities of design and management equal to those of foreign competitors? I cannot refer to the first without some apprehension, lest I should step on forbidden ground, knowing that opinions are various and and feelings strong; yet for this very reason I think the problem cannot be too freely or openly discussed. Let us compare some of the conditions of labor which obtain with us and those which obtain in the United States. Given a particular piece of work, done in a particular way and with given appliances, I have never seen any evidence to prove that the work is done more cheaply in America. The American workman has higher wages, and probably accomplishes somewhat more in a given time, so that the net result is probably about the same. That the output of an American workman is somewhat greater than that of his British brother is partly due, no doubt, to mere physical causes, a more bracing climate during the greater part of the year, and the fact that American workshops are, as a rule, better lighted, heated and ventilated, than most English shops, and that more attention generally is paid to hygienic conditions; partly to the greater stress which characterizes American life generally, and has grown to be inherent in the national character; but chiefly due to the fact, in my opinion, that American workmen are in general very much better educated than English workmen, not in the sense of mere technical knowledge of their work, but are generally more cultured and have a wider mental horizon. I believe it to be quite a general law of human effort that the better educated a man is the harder he will work at whatever his hands find to do, and that apart from the question of skill of handicraft an educated man will produce more in a given time than the uneducated. The cultured man has more to look forward to when his work is accomplished, and values his earnings and his leisure more highly, and so has greater incentive, and accustomed during his years of early training to constant effort, it becomes a mental and moral habit to work to the utmost of his capacity.

If these considerations be true, we may anticipate the future will bring a gradual increase in the rate of work, as our educational systems become more developed and extended, as, indeed, has no doubt been the case during the last fifty years; but this tendency will bring, and has brought us to face another problem, viz., the time of working. Concurrently with increase in the rate of work there has been a steady diminution in the hours of work, and probably we have not yet reached the limit. The efficiency of a particular manufacturing plant is measured by the ratio of the differ-

ence between the market value of the production and its cost to the capital employed, There are various fixed losses or charges, rent rates, management, and so on, which I need not enumerate; there are other charges which are a function of the time during which the plant is worked, for example, cost of power, lighting, etc., and, finally, there is the cost of labor, which, again, is a function of the hours of labor. Maximum efficiency is, therefore, determined by a linear differential equation. The problem has its counterpart in the determination of the proper size of a conductor for the transmission of electric energy, the solution of which is expressed by Lord Kelvin's rule; or it is, perhaps, still more analogous to the problem, when is a dynamo working at a maximum efficiency? The answer to which is, as you know, when the C? R losses in the armature are equal to the sum of all other losses. Unfortunately, dynamos never do work at their point of maximum efficiency, as long before then injurious sparking takes place, and the armatures are overheated. Possibly similar phenomena would occur in our workshops if you endeavor to apply too vigorously the solution I have indicated. The solution depends primarily on the function you choose to represent the dependence of the cost of labor in the hours of work. If any of you are inclined to work out the problem for yourselves on the lines I have suggested, I would commend to your notice the very excellent and truly scientific investigation recently made by Mr. Crompton into a corresponding and just as difficult a problem, the proper length of crank in a bicycle, pointing out in passing that in general a long crank corresponds to short

But to return, we assumed for the argument in comparing English and American labor that the appliances were the same, an assumption at the present time certainly not generally justified by the facts. American electrical industry, at any rate, is so much more concentrated into comparatively few shops on a larger scale than most of our English shops that there has been far greater possibility of standardization in every detail, and repetition of types, and consequent inducement to the introduction of automatic machine tools: but our workshops are changing in this respect, and any ground we may have relatively lost may be regained, and certainly will be recovered if those responsible for the laying out of our electrical undertakings realize that machinery of standard size and manufacture is not only cheaper, but intrinsically better and more accurate in workmanship than machinery built to suit their own particular idiosyncrasies. Who would think of asking a Lancashire boiler maker for a boiler 29 feet by 7 feet 9 inches, instead of 30 feet by 8 inches, because he wanted 5,800 lbs. of steam per hour instead of 6,000; but too often is the builder of an electrical plant forced to design his plant to fit the station, and to meet all manner of conditions which ought to have been subservient to the plant.

No doubt the introduction of automatic machine tools in England has been, and is, attended by many difficulties with the work people, but I am optimistic enough to believe that as our work people become better educated and more intelligently alive to their own interests these difficulties will rapidly disappear. This is not by any means necessarily coincident with the larger adoption of piece work, and will not, I think, be solved by this means. Piece work is open to many objections, and

often breaks down. Rightly or wrongly, it is always regarded with suspicion by the English working man, and is often unsatisfactory to the employer. Though in some American shops it has been adopted to a large extent, with satisfactory results, there is much less piece work in practice in America than is generally supposed. The largest engine-building shop in the world has no piece work whatever, but a modification of it, with which you may perhaps not be acquainted, but it is well worth study. and is largely obtaining in America. I refer to the system known as the "premium" system, where the workman, while receiving in any case his rated wages, has a definite price fixed for each piece of work, and divides with the employer according to an agreed scale any profit made by producing at a lower cost than the fixed price.

Once more return to an assumption I made in an earlier part of my remarks, viz, that the management of our English manufacturing or undertaking business is on a par with that of corresponding businesses in the United States, and under the word "management" I would include not merely shop and works management, but all that makes for intelligent and scientific design and technical control. I will not attempt an answer as to whether the assumption is justified, but it is worth noting that our American competitors have given proof of their own views on this point by the fact that more than one are establishing works in this country. They, at least, must have come to the conclusion that the general conditions of manufacture are as propitious in England as they are in the States, that labor difficulties are no greater here than there, but that by the introduction of the appliances they have so well worked out, the systems of shop management, and the designs and technical control they have elaborated, they look for advantages which justify their emigration. Whether it be a fact or not that we have any leeway to make up in this direction, it is at any rate a profitable reflection to consider how we may have lost ground, if lost it we have,

This leads us into the large field of the right training of electrical engineers and managers for our electrical undertakings. I for one would most heartily endorse the dictum of Sir Andrew Noble that the education of our English public schools and universities lays a foundation for successful struggle in the world's field of battle which is absolutely without rival, but is a foundation only; upon it must be built an adequate superstructure of technical knowledge and skill. Much progress has been made in England, but it must be admitted we are still far behind, which I venture to think is chiefly due to the want of frank recognition of hearty co-operation, not on the part of our public men, but of our managers and designers with the admirable institutions which already exist in this country. In laboratory and experimental equipment the technical schools and technical branches of the American universities far excel anything we have-with few exceptions-in this country, and it is not provided for the most part out of beer money or local taxation, but is the free and generous gift of manufacturing concerns and the captains of industry in the country, who are far sighted enough to realize that by such support they are taking the first steps toward building up and ensuring the lasting prosperity of their own industries. We in the North of England have the opportunity afforded us for like support by the splendid institutions at our very

doors, our university colleges and our municipal technical schools, all of them now provided with, or rapidly making provision for, adequate laboratories and workshops and most scientific teaching, and lacking only the earnest co-operation of the responsible managers and controllers of our undertakings. As a significant illustration of what I have been saying, I may mention that the professor of engineering at Cambridge told me a few days ago that the management of a large American concern about to start in this country recently applied to him to recommend a dozen of his students to take responsible posts, after brief further training in America, believing that nowhere else could they obtain better material for their purpose.

If in the future the scientific training in a technical school or the technical departments of our universities is to largely replace the old systems of apprentices and pupilage, a much wider responsibility is thrown on the teachers and professors than the mere imparting of knowledge or development of manipulative skill. It rests with them to teach the general principles upon which all successful manufacture must be based, and to influence the entire mental attitude of their pupils toward the profession for which they are training. If they fail in this they may indeed instruct but will not educate; and we shall have a new class of "technics" who will hinder rather than promote industrial progress. To avoid such dangers we cannot insist too strongly on the importance of the closest possible co-operation and interchange of opinion between the responsible and practical managers of our industries and members of the profession on the one hand, . and the managers and teachers of our technical schools on the other hand. The free interchange of opinion and discussion of methods is essential to the welfare of both.

Take two illustrations of such general statements. We have been talking much of late, but doing less, towards standardization of electrical work. Manufacturers know perfectly well the need of it, but are practically powerless as they have no option but to provide what they are asked for. Now, if the profession generally could agree from time to time upon certain standards, and every young engineer before he leaves school or college be trained to repeat them, to understand the reason for them, and to look upon departure from them without cogent cause as bad practice, they would very soon be universally adopted. Or as another example, I suppose nine-tenths of educated opinion in England has been for the last 10 or 20 years in favor of the adoption of the metric system as tending toward more accurate work, involving much saving in labor of computation, and facilitating our relations in foreign markets. Enlightened manufacturers are fully alive to its advantages, but cannot make headway against the mere dead weight of characteristic English dislike to change. Now, if the teachers in technical schools would be bold enough to agree to write all their text-books in the metric system, set every problem or example in it and make their pupils think in centimeter-grammes instead of foot-pounds, and be allowed to translate their results into hundredweights, ounces, drams, pennyweights, inches, sixty-fourths of an inch, and any other of our national abominations, as valuable arithmetic exercise only, we should very soon have such a preponderance of influence in favor of the metric system that its national adoption would no longer be delayed. Technical education does not end in school or college, but must be continued through life, and one at least of the chief instruments of it is our technical press and the publications of our technical societies.

We, members of the late Society of Northern Electrical Engineers, after seven years of individual growth, have just taken an important step in this direction by our willing amalgamation with the older and more influential Institution of Electrical Engineers in London, which, while leaving us full control of our local organization will, I am convinced, greatly conduce to increased usefulness and promote those objects with which our society was founded. The time will, I trust, come when the same influence working in other channels and with stronger currents will finally lead to the combination of all British engineers, whether civil, mechanical, naval, or electrical, purely professional, or engaged in the control of manufactures, into one great institution, with a roll of at least 20,000 members, and an income sufficient to provide not only a great central house and library in the metropolis, but also subsidiary houses and libraries in the chief centers of industry, and to ensure the rapid publication in convenient form of all new work which will widen the knowledge and resources of engineers, stronger than any of the trade guilds of the middle ages, or the great corporation of the learned professions, maintaining and extending the prestige, honor, and usefulness of British engineers throughout the world.

# IMPROVEMENTS IN WHEATSTONE AU-TOMATIC TELEGRAPH APPARATUS \*

Telegraphic apparatus for high-speed working is necessarily subject to exceptional wear and tear, and it is principally in attention to points of detail in construction that such wear and tear can be diminished. In the ordinary form of Wheatstone transmitter the contact

sometimes finds its way down between the electrical contact points, thereby rendering their action uncertain.

Again, in the ordinary form of instrument, the pivoting of the crank levers and horizontal levers is formed by flattening the ends of the wire forming the lever to the thickness of paper, and drilling a hole, into which a pin in the crank lever passes. The friction between the lever and the pin soon causes the hole in the thin metal to "draw" and throw the instrument out of adjustment. The adjustments, moreover, of the horizontal levers are made by nuts on each side of the contact lever, and are consequently very difficult of access and adjustment.

Mr. J. Willmot, superintendent of the Postal Telegraph Instrument Factory, has had these defects in view, and with the object of overcoming them, has introduced the following improvements:

1. Substitution of a permanent magnet for the spring and jockey roller now used for holding over the vibrating contact lever. adaptation of the magnetic arrangement entirely removes the downward pressure of the jockey spring, and greatly increases the holding-over force operating upon the contact lever, thereby causing more perfect impact and, consequently, contact between the contact points. The force necessary to drive the instrument when fitted with the magnetic arrangement is considerably less than with the jockey roller, due to the fact that the downward pressure on the pivots is entirely removed, also, as the pull is directly from side to side, and obeys the laws of magnetism, no sooner does the lever commence to move from the pole of the permanent magnet to which it is nearest, than the attractive force of that pole decreases as the square of the distance, and at the same time the pulling power of the pole to which it is approaching increases in a like proportion, a condition most favorable to the object in view.

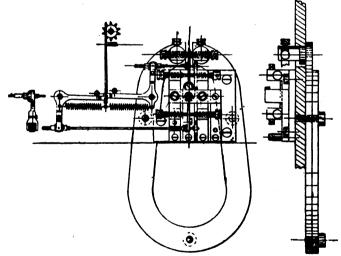

FIG. 1.—MAGNETIC BIAS FOR AUTOMATIC TRANSMITTERS.

lever is held over to the contact points by means of a spring and jockey roller operating upon the end of the lever. This arrangement not only necessitates a considerable movement of the lever to get upon either side of the center of the roller, but a heavy downward pressure is caused which has to be overcome by the contact lever in passing from side to side. There is considerable friction between the jockey roller and the end of the lever, and a lubricant has to be used to reduce it. This

The arrangement of the improved apparatus is shown by Fig. 1.

With the spring and jockey roller arrangement it is necessary to continually lubricate the roller, the oil thus used finding its way between the electrical contact points. With the magnetic arrangement this defect is entirely removed.

2. Substitution of properly-pivoted crossheads for the holes and pin joints of the horizontal levers, and arranging the screw adjustments in such a manner to permit of easy and convenient access. This arrangement con-

<sup>\*</sup>From the "Electrical Review," London.

siderably reduces the wear and tear of the instrument, and consequently prolongs its life.

Another important improvement which Mr. Willmot has introduced, and which has proved a great success, relates to the Wheatstone "perforators."

The punches of these perforators require frequent sharpening in consequence of the edges of the punches wearing away by the action of the oiled paper perforated. This is principally due to the fact that at each blow of the punch a film of dried oil is deposited by the paper upon the surface of the punch, which

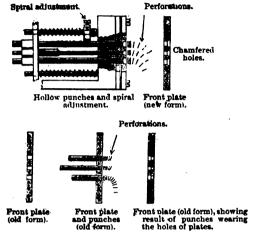

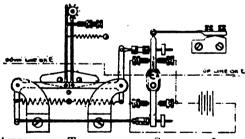

FIG 2.—WILLMOT PUNCHES.

soon builds up into convex form, the consequence being that the paper is bent over the punch before being perforated, and quickly wears away the cutting edge of the punch. The punched-out portions of the paper being bent by this process are sluggish in leaving the perforated plates.

To remedy these defects Mr. Willmot has devised a punch having a hollow recess at its end, as will be seen in Fig. 2; it having no center on which a deposit of oil can take place, the surface of the punch remains flat and makes a clean perforation. It has a further advantage, i.e., that in coming into contact with the paper to be perforated a small amount of air is compressed in the recesses of the punches, which air, after the perforation has been

AUTOMATIC TRANSMITTER, SHOWING JOCKEY WHEEL AND SPRING.

made, tends to blow away the punched-out portions of the paper, and also to prevent any oil or foreign matter accumulating in the recesses of the punches. When they require sharpening, the hollow or recessed punches are more easily ground and a flatter surface obtained than is possible with solid punches, because, firstly, having no center there is less metal to grind away; and, secondly for the same reason, they lie more flat upon the cutting surface of the oil-stone used for the purpose of sharpening.

Stone is being hauled from a quarry near Cleveland, O., by trolley. Fifteen thousand pound capacity freight cars are used, and the work is done after the close of the passenger traffic.

#### PARIS LETTER.

(Special Correspondence of Electricity.)

# Universal Metering Apparatus for Electric Cars.

M. Jacques Ullmann, a constructer of Paris, has just invented the above apparatus. We understand how necessary it is for the motorman to constantly know the output of the motors. This invention enables him to tell the rail-section on which his car is running and gives him useful indications how to operate the handle of the rheostat. A knowledge of the available storage battery voltage is equally useful, as it helps him to avoid more easily the often disastrous battery troubles, due to an over-discharge. To avoid the continual watching of two dial needles on the part of the motorman a simplification is required. amperemeter and the voltmeter are in the same case, and to overcome the periodic movements it is necessary to have two galvanometers of the Weston type with movable frames placed in the inter-air space of powerful horseshoe magnets. The voltmeter is graduated up to 120 volts for common automobile purposes. The amperemeter has two distinct graduations on both sides extending from zero. The left hand graduation indicates the battery charge, the right hand one indicates the discharge. The first named meter is graduated up to 40 amperes, the latter one to 100 amperes. As the scale is given in different colors no confusion is possible. In order to avoid passing the cables through the amperemeter the latter measures the intensity of the current by the potential difference at the terminals of a shunt inserted in the main circuit and fixed at any designated place in the car. Flexible wires are used for connecting the terminals of the instrument with those of the shunt. The magnets of the voltmeter and of the amperemeter are set in such a way that they cannot reciprocally influence each other. Cores are used for strengthening the magnetic flux, reducing at the same time the inter-air space to the minimum required by the set of movable frames which carry the needles. There is a set of spiral springs made of aluminum-bronze, one set for each movable frame and they act in opposite direction on the same frame in order to obtain a stability of the needle at the zero point. The needles are balanced and move in two parallel planes, separated by a space of several millimeters, so that they cannot touch one another.

# Experiments With a Remarkable Steam Engine.

Experiments have been made with a steam engine in the presence of civil engineering specialists at the works of Boulte & Larbodiere at Aubervilliers, near Paris, showing a remarkable progress in the manufacture of high-speed engines. This engine has two sets of compound double-acting tandem cylinders with pressure lubrication. It can normally develop 150 effective hp. at an initial pressure of 7 kilograms, and at an "angular" speed, heretofore unknown, 900 revolutions per minute. Torpedo boat engines make only 650 revolutions. The engine has been tested at a pressure of 26 kilograms per square centimeter. It is built entirely of steel, cast-steel and aluminum and weighs less than 600 kilograms, which is about four kilos less per normal effective hp. It does not appear doubtful that this apparatus will facilitate the solution of light power "electrogens" for automobiles, etc. We are glad to mention this initiative coming from French works. These new high-speed engines embody such real progress that they have already been adopted by several important industrial corporations, among others by the Compagnie Française, Thomson Houston, Or leans Railroad Company, Electric Illuminating Company, Pasteur Institute, Bois de Boulogne Railroad Company, the Compagnac Coal Mine Company, the Compagnie Electrique du Secteur des Champs Elysées, the Société de Transports Maritimes de Marseilles, and others.

#### The Dussaud Telephone.

At one of the last sessions of the Paris Academy of Sciences, M. Dussaud presented and operated successfully a new telephone, which is an interesting improvement, as his instrument permits the registration of messages during the absence of the person to whom they are addressed. M. Dussaud's apparatus comprises a transmitter and a receiver, both having several vibrating diaphragms acting in unison, which gives a sufficiently strong effect to register the spoken words and to repeat them whenever desired. This system will register news to daily papers telephonically, also administrative orders, theatrical performances, and even speeches by means of a transmitter placed under the orator's desk. Experiments have been made between Paris and Lille, and Paris and Marseilles, and the results are said to be very satisfactory.

### LONDON NOTES.

# [From our London Correspondent.] The Physical Society.

At the meeting of the Physical Society on March 2 there was a paper and discussion on "The Relative Rates of Effusion of Argon, Helium and other Gases." The paper was read by Dr. F. G. Donnan. This was followed by a contribution from Mr. E. C. C. Baly on "The Distillation of Liquid Air and the Composition of the Gaseous and Liquid Phases." Dr. Lehfeldt then read a paper by Mr. T. S. Moore on "The Reversibility of Galvanic Cells." In these experiments the reversibility of cells such as a Daniell and the Clark, which are assumed to be reversible, was tested by allowing the cell to send a current, and by sending a current through the cell. The EMF.'s of the cells were determined by means of a Crompton potentiometer, and from the EMF.'s on open and closed circuits the internal resistances of the cells were calculated. In course of a brief discussion on the paper Prof. Silvanus Thompson asked whether the author had made experiments upon Leclanché cells where the products of the action escaped, and in reply Dr. Lehfeldt said that experiments were not made upon these cells because they were known to be reversible.

# The Metropolitan Supply Company's New Station.

The new generating station of the Metropolitan Electric Supply Company at Willesden is now in full swing, and the public inspection took place on March 2. Lord Kelvin, Sir W. H. Preece, Prof. S. P. Thompson, Mr. S. Z. de Ferranti and a large party of electrical men and others being in attendance. The capacity of the works will be 27,000 kw. The generators were made and installed by the Westinghouse Electric Company of Pittsburg, the sets being the largest in use in English lighting works. Current is transmitted to transforming stations

in London for supply to consumers. These stations are situated at the generating works at Amberley Road, Paddington; South street, Manchester Square; and Rathbone Place, Oxford street. The electrical engineer for the Metropolitan Company is Mr. Reginald Todd. The company supplies 500,000 lights.

#### Glasgow Telephone System.

The Glasgow Corporation has advanced a step farther in regard to the establishment of a municipal telephone service. It has before it recommended for adoption by a special committee a scheme to cost at first \$600,000. Mr. A. R. Bennett is acting as consultant for the undertaking, and he has advised a complete exchange for 5,250 metallic circuit lines together with 50 public telephone call offices in the city and suburbs.

# The London Telephone Service.

It may be remembered that the plans recently announced, and now maturing, for bringing about an improvement in the English telephone service, include the granting of municipal exchange licenses for provincial towns and districts, while they involve for London a competitive service to be established by the General Post Office. Several towns are now taking active steps for establishing municipal exchanges, but so far no actual contracts have been placed, and the only parties who have yet profited are telephone consulting experts. As regards the London service, the General Post Office authorities have made large contracts for a telephone plant and underground wires involving an expenditure of about £500,000 out of the £1,250,000 which the London exchange is expected to cost. The Post Office has, like the National Company with which it will compete, been much delayed by local authorities exercising their autocratic rights over roadways, etc., but this is now past and it is expected that the Post Office will be able to afford telephonic communication by the end of the year in nearly the whole of the city area and many suburban districts within the London region.

# Polarization of Light.

A series of lectures on the above subject is being given before the Royal Institution of London by Lord Rayleigh. On the occasion of the first lecture, March 3, his lordship began by performing some of the leading experiments on the subject, and explaining some of the leading points in the theory. The first thing to raise the problem of polarization was the phenomenon of double refraction, noticed more than two centuries ago by Erasmus Bartholinus, when experimenting with a piece of Iceland spar. Lord Rayleigh showed the effect by means of a sphere of Iceland spar from the collection of the late Mr. W. Spottiswoode, presented to the Institution on the occasion of its centenary last year, and pointed out how by turning round the crystal the images of the beam passing through it could be separated to various distances, being always of different sizes and at different focuses. A similar experiment was next performed with a doubleimage prism, and it was proved that in the prism the light from the lamp had suffered change in some respect, by studying the effects of introducing a second double image prism behind the first. In fact, the condition of light known as polarization had been produced, or in Newton's words, the ray had sides. The lecturer next described how tourmaline could be employed to show this "sided" character of light, and proceeded to discuss the manner of accounting for these phenomena, regarded from the point of view of the undulatory theory of light. After briefly summarizing the characters of wave motion, he showed how the supposition that light consisted of transverse vibrations at once afforded an explanation of polarization, thus taking a vertical ray of light the vibrations in the north and south direction would correspond to one sort of polarization, and those in the east and west to the other. Having illustrated this by a mechanical model, he described another method for obtaining polarized light, or for determining whether any particular light was polarized or not, which did not depend, like those already mentioned, on a double-refracting crystal. This was by the reflection and refraction of a beam at the surface of any ordinary transparent substance. The law for determining at what angle reflection must take place in order that the light should be as completely polarized as possible was stated empirically by Brewster, and has since received a theoretical explanation. Some experiments with piles of glass and mica plates concluded the lecture.

#### The Patent Office Exhibit at the Paris Exposition.

Mr. E. B. Moore, who has been appointed by the Secretary of the Interior to accompany the exhibit of the Patent Office to the Paris Exposition, will leave New York to-morrow, the 29th inst., on the steamer La Touraine.

The Patent office exhibit, comprising 208 models, stored in 30 cases, is at present under bond in Paris and can be released only upon personal identification by Mr. Moore. The exhibit will be made in the United States Department of Machinery and Electricity in the building situated in the Champs de Mars.

"The exhibit," said Mr. Moore, "is not as large as was originally intended, owing to the fact that it was selected in great haste. After the decision of the Attorney General that the models could not go out of the United States, the idea of an exhibit was given up entirely and it was not until Commissioner General Peck had a special act of Congress passed au-thorizing the loan of the models to the Exposition that the work of collecting and classify-ing them began. This was only a short time ago, and it is remarkable that so much has been accomplished."

The exhibit consists principally of electri cal devices, comprising the more important inventions of Thomas A. Edison, whom Paris regards as a veritable wizard; H. C. Maxim, the inventor of the celebrated gun of that name; C. F. Brush, of electric-light fame; C. J. Van Depoele, Thomson and Houston, and others. Among the devices of Edison to be exhibited are the printing telegraph and the magneto-electric machine, considered the latest application of the principle of magnetic

electricity.

Many of the devices are interesting from having been the subject of considerable litigation, and the entire exhibit is designed chiefly with a view to illustrate the growth of electrical science from pioneer inventions to the latest and most marvelous developments.

On March 31, the American Circular Loom Company will remove their Chicago office from the Marquette Building, taking a well-fitted and commodious store at 141 Clinton street, where they will carry a large stock of steel conduit "Electroduct." conduit "Electroduct." Geo. W. Patterson, their Western representative, will continue to also handle the Gordon Primary Battery, which line he reports especially prosperous this spring, the Western business having doubled in the last six months, owing principally to the extensive adoption of the Gordon cell in central and an arrange of the control o tral energy telephone work.

#### OBITUARY.

#### Darius Colombani.

Mr. Darius Colombani, the well-known church electrical decorator, died at his home in this city on March 21.

Mr. Colombani was born in Italy in 1850, and after coming to this country interested himself in matters electrical. His early training and favorite studies had inclined his mind to the subject of symbolical church decoration, and it was only natural that the idea of applying electricity to this purpose should present itself to him. In 1889, after considerable opposition on the part of ecclesiastical authority, Mr. Colombani obtained consent to light with electricity the church of the Holy Innocents on West 37th street, New York. After this followed the installation of electric-light deco-

DARIUS COLOMBANI.

rations in St. Francis Xavier's, St. Bernard's, St. Agnes's, St. Francis d'Assisi, St. Patrick's Cathedral and many other sacred edifices.

Mr. Colombani was at one time connected with the Edison Electric Illuminating Company of this city, and was also with the Metropolitan Electric Equipment Company. He was twice married, and leaves a wife and a son by his first wife to mourn his demise.

# Amelia Dickinson Pope.

Amelia Dickinson Pope, widow of the late Franklin Leonard Pope, died of heart failure in Amherst, Mass., on March 20. The funeral service was held at Amherst on the 22d and the interment was at Great Barrington, Mass., on the following day. Her only son Leonard is at Amherst College, the eldest daughter Anna at the University of Wisconsin, and the youngest daughter Amy at Smith College, Northampton,

### Bernard M. Shanley's Funeral.

Bernard M. Shanley, the millionaire trolley magnate, was interred Friday in the cemetery of the Holy Sepulchre in Newark, N. J. The funeral is reported as the largest ever held in that city. The pallbearers were ex-United States Senator Smith, John D. Crimmins, David Young, Jeremiah O'Rourke, Dr. Leslie B. Ward, Elisha B. Gaddis, Peter Hauck, Judge Gottfried Krueger, Arthur Devine, ex-Senator Stolesbury, Philip N. Jackson, Edward, F. C. Young, Frank Sheppard, and Randall Morgan,

#### LEGAL NOTES.

The Menominee (Mich.) Electric and Mechaninal works were recently turned over to A. W. Stein of Chicago, a receiver in bankruptcy petition. The company's liabilities are \$37,-000; assets, \$10,000.

Judge Swan in the United States District Court of Detroit, Mich., has rendered a decision which denies the validity of an ordinance passed several months ago by the city council requiring the street railway companies to reduce rates of fare to three cents. The court says that there is nothing in the charter of the city which authorizes such an ordinance, and grants an injunction to restrain the city from enforcing it. Judge Swan said in the opinion: "To enforce this ordinance would be an act, not of regulation, but of spoliation. The police power includes the general management as regards the protection of life and property and the accommodation of the public, but the Legislature itself could not effect the fares agreed upon. It might be for the welfare of the public that the fares should be abolished altogether, but that would be confiscation, and could not be tolerated." The court holds that the substance or meaning of all these ordinances permits five-cent fares, which privilege cannot afterward be annulled.

#### American Institute of Electrical Engineers.

The 141st meeting of the Institute will be held at 12 West 31st street, New York City, this (Wednesday) evening at 8 o'clock. A paper will be presented by Joseph Sachs, entitled "The Evolution of Safe and Accurate Fuse Protective Devices."

Applications have been received from the following candidates for associate membership, which will be acted upon by the council at its meeting April 25:

Walter D. Stelle, J. H. Livsey, Detroit, Mich. J. J. Oolgaardt, Walter I. Slichter, John B. Barr, John Peabody Moore, Schenectady, N. Y.

Cloyd Marshall, Indianapolis, Ind.

J. M. Leamy, Ottawa, Canada.

Manuel B. Gutierren, Jalapa, Mexico.

Gabriel Fernandez Somellua, William Howard Cole, William Hendrik de Waal, Mexico City, Mexico.

Marshall Osborne, London, England. Julio Guerrero, Durango, Mexico. William Hand Browne, Jr., Urbana, Ill. William W. Hanscom, San Francisco, Cal. William James McClure, New York City. Richard Varley, Jr., Jersey City, N. J. Next meeting is in New York, April 25.

The annual meeting will be held in New York, Tuesday, May 15. The general meeting will begin at Philadelphia in the afternoon of May 16.

## PERSONAL MENTION.

Mr. Charles F. Brush, of Cleveland, O., has won the Rumford medal of the American Academy of Arts and Sciences by the discovery and development of the electric are lamp.

Mr. Louis Uhlman, aged 26, an electrical inventor of promise and first assistant of Nikola Tesla, died recently in Phoenix, Ariz. Tuberculosis was the cause of death. Mr. Uhlman, his friends say, was a photographer of rare ability and the inventor of photographic processes and supplies.

Mr. John M. Roach, general manager of the Chicago Union Traction Company and president of the American Street Railway Association, is in receipt of an urgent invita-tion to be present at the International Tramways Congress. to be held at the Paris Exposition next September, and to take part in the discussions.

Mr. J. R. Bullard, one of the chief promoters of the first electric street railroad in Dedham, Mass., and president of

the Dedham Electric Lighting Company, died at his home a short time ago.

Prof. L. J. Blake, who is at the head of the school of electrical engineering in the University of Kansas, has been elected to membership in the American Physical Society. This society, recently organized in New York City, aims to fill the same position in this country that the Philosophical Society does in England.

Mr. P. D. W. Hankey, manager of the Gettysburg (Pa.) Electric Light, Heat & Power Company, and assistant man ager of the Gettysburg Transit Company, died recently at his home in Gettysburg from the effects of a stroke of apoplexy.

Mr. Babert V. Eiseck, a Japanese mechanical and electrical engineer, has been in Pittsburg, Pa., for the purpose of getting ideas and preparing plans in connection with the building of industrial plants in Japan.

#### INCORPORATIONS.

The Colorado Springs Electric Company, Colorado Springs, Col. Capital stock, \$1,000,000. Incorporators: W. P. Bonbright. William A. Otis and Leonard E. Curtis, all of Colorado Springs

The Stanley & Patterson Company, New York City-to manufacture electrical apparatus. Capital stock, \$200,000. Directors: A. F. Stanley of Brooklyn, G. L. Patterson of New York and A. S. Deveau of Mount Vernon.

The Consolidated Light, Heat & Power Company. Camden, N. J.-to furnish electric light, heat, gas, etc. Capital stock, \$500,000, Incorporators: F. A. Magowan, B. C. Warnick, J. W. Weart, all of Camden.

The Crandall Electric Monogram Company, New York City. Capital stock, \$50,000. Directors: Silas B. Dutcher, Lucien S. Crandall, James R. Davies, M. C. Ebel and Norman S. Dike of Brooklyn.

The Yardley Electric Light, Heat & Power Company, Yardley, Pa.-to supply light, etc. Capital stock, \$25,000. Incorporators: E. J. Moore, S. J. Moore, Jr., T. A. Royal. Jr., J. MacFadden, R. Remont, all of Philadelphia, Pa.

The New Era Electric Drill Company, Colorado Springs Col. - to manufacture and sell electric drills. Capital stock, \$1,000,000. Incorporators: A J. Clark, H. N. Hawkins, J. McDonough, M. C. Jackson, W. Thorn, W. C. Allison, all of Colorado Springs.

The Electric Log Recorder Company, San Francisco, Cal.to deal in electric log recorders. Capital stock. \$30,000 Incorporators: F. M. Munger, L. W. Storer, L. T. Jones, W. B. Armstrong, all of San Francisco, and J. Mills of Oakland.

The Detroit Electric Piating Company, Detroit, Mich. Capital stock, \$10,000. Stockholders: Howard G. Harris William H. Thayer, George McClusky and Louis W. Wheeler.

The Novelty Machine & Electric Company, Wheeling. W. Va. Capital stock, \$50,000. Incorporators: R E. Schubert, Charles Menkemeller, George E. Kurner, H. G. L. Fredreichs and A. H. Weidebusch.

## COMMERCIAL PARAGRAPH.

Elsewhere in this issue will be found the advertisement of the Jewell Electrical Instrument Company. 439 Marquette Building, Chicago. This well-known concern has on the market direct current ammeters, milli-ammeters, voltmeters and milli-voltmeters, made up in switchboard, portable and laboratory style. All of these instruments are of the D'Arsonval type, having a coil moving in the field of a permanent magnet. The permanent magnets are made from imported magnet steel, and are thoroughly aged before being placed in the instrument. The springs are made from a special low-resistance, phosphor-bronze alloy having a fine temper. The series coils in the voltmeters and the shunts in the ammeters are made from an alloy having a zero temperature coefficient. The voltmeters have a resistance of about 120 ohms per volt of scale. i. e., a 0-150 voltmeter has a resistance of 18,000 ohms. The special features of this instrument are rigidity of construction, dead-beat qualities, constant temperature coefficient of the instrument, which is stated to be unaffected by changes in temperature, and handdrawn scales from recognized standards, which insure correct readings. The scale divisions are uniformly spaced, and there can be no magnetic lag, as there is no iron in the moving parts; the scale readings begin at 0. Only a small amount of energy is consumed by the meter, a 150 voltmeter, consuming but 114 watts on the full deflection. The makers claim fair accuracy for the instruments in all positions and absolute accuracy in the position in which they are calibrated, whether vertical or horizontal. A device for eliminating the effects due to static electricity is included. The scale is adjustably operated by a small, milled head, partially projecting through the case, which on being turned by a rub of the finger, operates a micrometer screw which in turn shifts the entire scale, bringing its zero to the zero position of the needle should the latter become bent by any mishap.

#### ELECTRICAL PATENT RECORD.

This department is edited by OSCAR A. MICHEL. Solicitor and Attorney for AMERICAN AND FOREIGN PATENTS, at 502 and 504 Broadway (Room 1204), New York City, also at 639 F street, N. W., Washington, D. C., who has been identified with this work before the U.S. Patent Office for more than fifteen years. Any inquiries upon the above subject as well as printed publications containing all information regarding the cost of United States and Foreign Patents Trade Marks, Designs, etc., will be given free upon application by addressing OSCAR 4. MICHEL, Nos. 302-304 Broadway, New York City, N. Y., or 639 F street, N. W., Washington, D. C. Copies of any patent published can be furnished upon payent of ten cents. When ordering give name, date and title of invention wanted.]

# GENERAL NEWS.

What is Going On in the Electrical World.

#### LIGHTING.

Aberdeen, S. D.—The question of municipal owner-ship of the electric light plant will be submitted to the voters at the coming election.

Adel, Is.—The citizens of this place are agitating the

question of erecting an electric light plant.

Alliance, Neb —A. Minnick, of O'Neill, has been given a franchise to erect an electric light plant at Alliance.

Beeville, Tex.—I. N. Hettison contemplates the erection of an electric light plant in this place.

Belleville, Ill.—F. C. Postel, the electrical expert of Chicago, is preparing plans and specifications for an electric light plant for this city. Bids for the construction of the new plant will soon be advertised for.

Bellaire, Mich.—Bellaire has voted to raise \$2,700 to complete its municipal electric light plant which was begun last summer.

Central Covington, Ky. - Sealed bids will be received by W. E. Hockman, the city clerk, up to 5 PM, Wednesday, April 4, for the franchise or privilege of entering in and upon the streets, alleys and highways of this town, to erect and maintain poles, wires and appurtenances for furnishing electricity to consumers for a term of twenty years from the date of the granting of this franchise in accordance with a resolution adopted by the trustees.

Champion, Mich.—Electric lights are assured for the streets of this place in the near future.

Columbus, O.—A resolution is being prepared for the introduction in the city council authorizing an appropriation sufficient to build and equip an electric light plant of ample capacity to light all the public streets of this city. About \$232,000 will be expended.

Emporia, Va.—A bill has passed the Legislature authorizing the city to issue bonds for the construction of an electric light plant. Address W. S. Goodwin.

Granite, Ore.—A franchise has been granted to Portland men for an electric light plant in this new

mining town.

Hanoverton, O.—The citizens of this village are talking of issuing bonds for the erection of an electric light plant.

Hot Springs, S. D.—The Water, Light & Power Company is contemplating putting in new ma electric light plant, to cost about \$25,000.

Huntingburgh, Ind.—Miessner Brothers have been awarded a franchise to erect an electric light plant in this city.

Ilion, N. Y.—At an election held recently it was voted to issue \$30,000 in bonds to build an electric light plant.

Lott, Tex.—The Lott Milling & Electric Light Company, recently incorporated, will erect an electric light plant.

Louisville, Ky.—Bids for an electric power plant for elevators and lighting the Jefferson County courthouse will be received at the office of K. McDonald, architect, until April 1.

Marion, Ind.-B. F. Burk will at once begin the erection of a new electric light plant in this city.

Manitowoo, Wis.—The citizens of this place are in favor of the erection of a municipal electric light plant.

Milbourne, N.C.—This city is to have a new electric light plant.

Nashville, Tenn.—The city council has passed a bill appropriating \$150,000 to erect an electric light plant.

Norfolk, Va.—The Norfolk Electric Light & Power Company has been granted a franchise, and will establish a \$300,000 electric light plant. Address W. D. Pander, vice-president.

Owensboro. Ky.—Plans and specifications are being prepared by F. F. Vater, of Chicago, for the new electric light plant to be erected in this city.

Paulsboro, N. J.—William J. Adamson is about to organize an electric lighting company here.

Peru, Ind.—The city council has accepted the proposition of H. C. Ullen, Jr. and S. V. Perrott, of Indianapolis, for a new electric lighting plant, complete with buildings, to be in operation July 1, 1991.

Pleasantville, N. J.—Plans will soon be s'arted for an electric light plant to be erected here. Mr. Price can be addresse

Sandersville, Ga.—The city council is entertaining a proposition from certain Northern capitalists for the erection of an electric light plant here.

Schulenburg, Tex.—Mr. Anderson is organizing a stock company for the establishment of an electric light plant.

St. Mary's, W. Va.—The St. Mary's Water & Light Company, recently incorporated, will erect an electric light plant and waterworks.

St. Paul, Minn.—The city council has directed that the committee employ an electrician to perfect plans for a city electric lighting system.

Tuscola, Ill.—The Wortham Brothers' Company is thinking of putting in its own electric lighting plant.

#### STREET RAILWAYS.

Battle Creek, Mich.—The common council has granted a franchise to Capt. G. W. Bullis for the Battle Creek-Hastings Electric Railway. All the right of way between the two places is now secured, and work on the construction will begin soon.

construction will begin soon.

Brooklyn, N. Y.—The directors of the Long Island Railroad Company have decided to co-operate with the Atlantic Avenue Improvement Commission in the scheme to do away with steam on Atlantic avenue, in this city, independently of the East River tunnel project, which has been temporarily abandoned. The motive power of the entire line to Jamaica is to be changed from steam to electricity. The estimated cost of the improvement is \$2,510,000, half of which according to the act is to be paid by the city.

Charrefield Me—Erederick Vates Charles Goodwin

Cherryfield, Me.—Frederick Yates, Charles Goodwin and other Biddeford and Saco capitalists have petitioned for a charter to construct an electric line from a point in Cherryfield to a point connecting with the Washington County road, the name of the proposed line to be the Cherryfield & Millbridge road and the distance about six miles. The capital stock is placed at 860,000

Dayton, O.—A franchise has been granted in this city to the Dayton & Troy Electric Railway Company by the county commissioners. Work of construction will begin about June 1.

Elwardsville, Ill.—The Mississippi Valley Traction Company of this place, lately incorporated for \$500,000, will construct an electric railway from East Sz. Louis, Ill., to Edwardsville by way of Collinsville.

Fayetteville, N. C.—J. W. McNeill has received a franchise for building an electric railway and will generate power by water from the Big Rockfish Creek.

Gilmanton Iron Works, N. H.—There is a movement on foot to build an electric road in this town.

Gloversville, N. Y.—The directors of the proposed Mountain Lake electric railroad, extending from here to Mountain Lake, on the top of the Adirondack foothills, have signed a contract with Boston capitalists to build the road which will cost \$150,000.

Hagerstown, Md.—A bill has been introduced into the Maryland Legislature empowering the Hagerstown & Frederick Railway to change its motive power from steam to electricity and to issue bonds to complete the construction of the road.

Harper's Ferry, W. Va .-- The Harper's Ferry Power Company has been organized for the purpose of constructing an electric railroad and will build a power house, etc. Address P. Evans, Philadelphia, Pa.

Houghton, Mich -The Houghton County Railway Company will soon begin the construction of an electric street railway.

Lebanon, N. J.—It is proposed to build a trolley line with an electric lighting plant, from this place to Washington, a distance of 14 miles, passing through Annandale, Clinton, Highbridge, Gien Gardiner and Hampton, to connect with the Phillipsburg line through Washington, Hackettstown and Lake Hopatcong to Newark. It is proposed to extend to Somerville. The power house will be at Clinton.

Nashua, N. H.—Surveyors have been at work upon the route of the Hudson, Pelham and Salem Electric Railroad, which will connect this city with Haverbill,

New York.—The New York, Brooklyn & New Jersey Rapid Transit Company of this city proposes to construct and operate an electric railroad 6 miles long from Manhattan to Brooklyn.

Oakland, Cal.—A. S. MacDonald and W. G. Henshaw of this city have applied to the supervisors of Contra Costa County for a franchise to run an electric line from the town to San Pablo to the Alameda County line, by way of Point Richmond.

Rockville, Md.—Electric railroad enterprises will be an issue in the approaching municipal election here.

Youngstown, O.—The city council has granted a franchise to the Youngstown & Sharon Electric Railway, giving it direct entrance into this city.

### MANUFACTURING.

Buffalo, N. Y.—There is a possibility of the establishment in this city of a factory for the manufacture of electric interlocking switches to be used by steam and trolley reads, which are said to be a vast improvement on switches now in general use.

ment on switches now in general use.

Harrisburg, Pa.—The Pennsylvania Steel Works has fin shed and shipped a duplicate order for frogs for a trolley line in Paris leading to the Exposition grounds. The original shipment, made about six weeks ago, is given up as lost, as the vessel is a month overdue. The road must be completed by May 1, and an effort is being made to have the shipment reach Paris by April 1.

Kansas City, Mo.—The Metropolitan Street Railway Company recently let the contract to the St. Louis Car Comrany for 50 new trolley cars; 25 of these cars are to be delivered in this city June 15, the others are to be here September 1.

Morehead, Ky.-W. J. Rice of this place wants to correspond with manufacturers of dynamos and electric light supplies.

New Haven, Conn.—The Dennison Electrical Engineering Company of this city has begun work on a

large motor omnibus which will be run next summer between Torrington, Litchfield and Bantam Lake.

New York .- The change in the management of the New York.—The change in the management of the Edison, Jr., Light & Power Company has resulted in placing the company on a good business basis, and orders for its batteries are now said to be coming in very satisfactorily. The company manufactures a small battery for light work, such as operating sewing machines, "sparking" engines, running miners' lamps and other invitant process where such as the company manufactures as a state of the company manufactures. machines, "sparking" engines, running miners isamps and other similar purposes where only small power is required.—A company has recently been formed here known as the William S. Chester Co. for the purpose of manufacturing electric and other motors for organs.

Pittsburg, Pa.—The electrical contractors are talking of building a plant in this city for the manufacture of electrical sundries.

Perkasie, Pa —The citizens of this place are considering the erection of a factory for the manufacture of trolley cars.

-The Warren Electric Manufactur-Sandusky, O.-Sandusky, O.—The Warren Electric Manufacturing Company, which recently completed a large order for electrical machinery for Armour & Co., has just booked another big contract with the same firm. The last order is for two large alternating dynamos, the combined weight of which will be nearly 60 tons. Their capacity will be 15,000 lights. The machinery is for the Kausas City plant of the Armours. One of the alternators will be shipped early in June and the other one about a month later.

#### COMPANY MATTERS.

Baltimore, Md.—It is reported that the United Railways & Electric Company, and the United Electric Light & Power Company, which are practically one company, have concluded a deal with the Susquebanna Electric Power Company whereby the last named is to furnish the electricity required to operate the street railway lines, and for lighting purposes in this city.—The Frostburg Gas & Electric Light Company recently filed an application for dissolution.

Hammonton, N. J.—The Hammonton Electric Light Company has sold its electric light plant, including franchise and contracts for lighting the streets, which have six years to run, to the Electric Light & Power Company of this city, a new company recently organ-

Troy, N. Y.—Barnes & Pavton have been awarded the contract for installing a complete electric light plant for the Mahony Manufacturing Company. The concern will use both arc and incandescent lamps.

Washington, D. C.-The Potomac Electric Light & washington, D. C.—The Potomac Electric Light & Power Company has secured permission of the District Commissioners to erect four poles on 37th street between the Canal road and Prospect avenue, and to replace four poles on the Canal road. To these new poles three 500,000 C. M. cables will be attached, and will supply additional power to the Great Falls electric railroad.

Yardley, Pa.—The Yardley Electric Light, Heat & Power Company has purchased the plant at this place belonging to David Peoples, of Philadelphia.

## POWER AND TRANSMISSION PLANTS,

Athens, Ga.—A company in this city, headed by Messrs. A. H. Hodgson, E. R. Hodgson, J. M. Hodgson, J. Y. Carithers and W. T. Bryan, will establish an electric power plant at Tallahassee shoals, eight miles from here on the Occnee River. One hundred thousand dollars will be spent in establishing the new plant, and 1,000 horse power will be developed, which will be rented to different manufacturers in this city.

Buena Vista, Va.—W. A. Joiner and V. O. Brown, of Montezuma, Ga., are investigating with a view to establishing an electric power plant here.

Cripple Creek, Col.—The La Bella power plant was lately reorganized, and it was then decided to double the capacity of the plant.

Holton, Kan -D. K. Rinehard is preparing to build an electric power plant at this place.

Waterville, Me.—An important deal of water power privileges has been consummated by Frank Chase of this city, who has purchased the water power privilege between Great and Long ponds. The purchase means that Mr. Chase is to erect an electric lighting and water power station there with which he will supply the town of Belgrade Mills both with water and lights.

#### AUTOMOBILES.

Newark, N. J.—It is claimed that the Automobile Company of America, incorporated in this city last week, with a capital stock of \$250,000, is part of the scheme to combine all the Western automobile manufactories. The incorporators are: George A. Lamb, Edward B. Hawkins and Alfred G. Brown.

Newport, R. I.—The New England Electrical Vehicle Transportation Company of Boston has purchased from Mr. Albert H. Hayward the so-called stable property on State and D. wning streets, which it will use for an automobile depot, and be complete in every detail. The company intends having about 100 automobiles here this summer.

# THE TELEPHONE WORLD.

#### Strong Company in Each State.

According to a daily paper, among the important plans which the Telephone, Telegraph & Cable Company of America has under way are the making of close arrangements with Western telephone companies for the purpose of establishing a through line to the Pacific coast. When this arrangement is perfected the independent telephone company will be in a position to cut into the long distance business of the Bell Company and greatly injure its revenue.

Among the Western lines with which negotiations are said to be pending are the San Francisco lines and those in Oregon and Washington, the Rocky Mountain system, which branches out in various directions from Denver and various systems between Denver and the coast. The Southern States are also being canvassed, and it is expected that arrangements will be made for co-operating with the Southern Bell Telephone Company, which includes Atlanta and traverses several Southern States.

Steps are also being taken to get control of the Cincinnati & Suburban Telephone Company, which is one of the most important of the intermediate systems, and the proposed long distance service of the Telephone, Telegraph & Cable Company includes the Washington City lines and the Miami Valley & Ohio lines.

The policy of the new movement will be to have a strong company in each State. These companies in turn will furnish the funds with which to buy competing companies of the Bell Company.

#### Increase of Bell Telephone Stock.

At a special meeting of the stockholders of the Bell Telephone Company at Philadelphia on the 20th inst. it was voted to increase the capital stock of the company from \$4,000,000 to \$6,000,000. The new stock may be subscribed for at par, \$50, until April 20, payments to be made May 20, July 20 and September 20.

Referring to the consolidation of the American Bell Telephone Company with the American Telephone & Telegraph Company, President John E. Hudson of the Bell Company is reported as saying that the present change is the logical result of the great development of the long-distance telephone system. The American Telephone & Telegraph Company, which was organized to build the long-distance lines, became the owner of the capital stock of many of the licensees of the American Bell Telephone Company. These holdings increased so that it was thought best to put both concerns under one control. Existing statutes made it necessary that this control should be vested in the long-distance company.

The Union and Independent long distance telephone companies of Kansas and Missouri, with 300 miles of lines in the two States, have just been consolidated under the name of the Kansas Telephone Company with a capital of \$200,000. The company has connections with the other independent long distance companies of Kansas and Missouri, to compete with the Bell Company. All these long distance companies want an independent company to get a franchise in Kansas City, in order to give them connections with St. Louis and Chicago by way of that city.

By a recent agreement between the Bell Telephone Company and the Diamond State Telephone Company of Dover, Del., the present line of long-distance telephone from Dover to Wilmington and from Elkton, Md., to Wilmington, were turned over to the Diamond State Telephone Company. By this traffic agreement the Diamond State Telephone Company's subscribers will be able to reach the entire system covered by the Bell Telephone Company throughout the United States.

At a meeting of the stockholders of the Marietta Telephone Company, Marietta, (i.a., recently, called for the purpose of discussing their future prospects, after a thorough examination of the company's affairs it was decided to discontinue business and dispose of the property on the best terms obtainable, it having been determined that the receipts would not run the business.

A bill was passed in the House of Representatives on March 19 incorporating a telephone company to compete with the Bell Company in the District of Columbia, which promises to furnish service to business houses for \$48 a year and to private residences for \$36.

The Bell Telephone Company, which put telephones in Shelbyville, Ind., some time ago free of charge in order to crush the existing company, now announces prices the same as the local company's after April 1.

The Anthracite Telephone Company, which is now erecting lines in New York State, will apply to Governor Stone of Pennsylvania for a charter of incorporation to erect and maintain wires in Susquehanna and Lackawanna counties.

#### An Independent Company in Texas.

The independent telephone project in Texas has assumed definite shape, the charter of the Lone Star Telephone Company with a capital stock of \$500,000 having been filed in the office of the Secretary of State at Austin. One-tenth of the stock has been paid.

The purpose of the company, as stated in the charter, is to construct, acquire, maintain and operate telephone and telegraph lines in Texas. The business of the corporation will be transacted in Galveston, Houston, Austin, San Antonio, Laredo, El Paso, Fort Worth, Whitesboro, Denison, Paris, Texarkana, Longview and Dallas. The principal office will be in Austin.

The incorporators are: J. B. Earle and J. E. Boynton, of Waco: H. M. Aubrey and F. C. Smith, of San Antonio; W. H. Eager. James J. Brailey, of Wauseon, O.; J. M. Longnecker, Delta, O.; W. H. Harper, Jr., John P. Bailey, Ottawa, O.; Jafes King Duffy, New York City; W. A. Armstrong, Doniphan, O.

In addition to establishing exchanges in each of the cities above named, it is purposed to connect them with long-distance lines. The Bell interests, which operate in Texas under the name of the Southwestern Telephone & Telegraph Company, are alarmed at the financial strength of this new rival.

#### Cheap Telephone Service in Charleston.

Recent developments in the telephone situation at Charleston, S. C., says the N. Y. "Commercial," have broken the long monopoly which was held by the Bell Company. Two years ago a new company, the Carolina Mutual, invaded the field, prepared to put in a first-class service.

From the time the magnates came on to purchase property however, the Bell people started their fight and carried this to the city council, with almost disastrous effect to the Carolina Mythal

There were several things which helped the Bell Company in its council fight, but the slick work and scheming was uncovered and the popular cry raised gave the Carolina Mutual Company the rights and franchise it had desired.

The Mutual Company did not come up to expectations after a trial, however, and a year ago the plant was sold to an English syndicate. As the Gordon Telephone Company the concern has given the Bell Company the strongest opposition it has ever had.

The home phones, put in at \$24 per annum, and the office phones at not much more, were too much for the Bell and the Gordon subscription list is as large as the Bell.

The public has received all the benefits, for the two systems have been made next to perfect.

The Bell Company has very largely increased its list of subscribers by putting in 'phones where five cents only is charged for each call message.

charged for each call message.

This 5 cent rate makes the service limited, and requires at least \$2 per month to insure the putting in of a 'phone, while the other company, reaching the same subscribers, and with a service equally as good, gives an unlimited service at the same rates.

The Gordon Company has taken scores of subscribers from the Bell, has divided the honors with that company in that it places two 'phones in every business house and residence, and has gathered many subscribers who never used a 'phone under the high rates of the Bell Company.

Two independent telephone companies are seeking franchises to operate telephone systems in Kansas City, Mo. One known as the Parker Company agrees to complete the work of installation within one year from date of agreement. The rates named are \$2 per month for business houses and \$1 for residences. Three 'phones are to be furnished without charge to the city. The second applicant designated as the Montague Company, asks a thirty year franchise, with the following rates: Residences, single line, \$1.50; party line, \$1; business houses, single line, \$2.50; party line, \$2. The company offers to furnish five 'phones free for the use of the city and to put in a free fire alarm service of ten stations, the location of said stations to be designated by the council. This company agrees to use the Ericsson system, which is looked upon favorably by the council committee.

At a recent meeting of the aldermen of Brockton, Mass, a franchise was granted to the Massachusetts Telephone Company, with several iroxclad conditions, among which is one that the company shall pay to the city annually after the first year of operation 2 per cent. of its gross earnings. In constructing conduits, the company must employ Brockton laborers at \$2 per day. It must file a bond of \$10,000 to comply with the conditions of the franchise and deposit a certified check of \$3,000 as a guarantee to have the exchange in operation in fifteen months.

#### To Unite Under One Name.

Cleveland officials of the Bell Telephone Company state that the consolidation of the Bell Company with the American Telephone & Telegraph Company, reported in last week's Electricity from Boston, is only the working of a wheel within a wheel.

They say that the American Telephone & Telegraph Company is the first long distance telephone company and that it was organized and is now under the control of the Bell management.

The reasons given for the proposed transfer of the Bell stock over to the American Company is that the Bell Company desires to change the name of its entire system to the American Telephone & Telegraph Company. As the latter company is organized under the laws of New York, and the Bell under the laws of Massachusetts, by changing the name of the whole system to the American Telephone & Telegraph Company both companies will come under the laws of New York, which the officials believe are more favorable for the enlargement of their business.

It is said that the change will in no way affect the independent telephone companies throughout the country.

# Decision in Favor of Telephone Companies.

A dispetch from Lansing. Mich., states that the question of the right of telephone, telegraph and electric railway companies to trim trees along the highways traversed by their poles and wires, has long been a disputed one in Michigan, and as these several industries were extended the controversies over this matter became more frequent. Finally the question found its way into the courts, and the highest tribunal decided that the companies could trim trees interfering with their wires in a unanimous opinion handed down in the case of Oscar Wyant vs. the Central Telephone Company.

The case came from Berrien County, where Wyant commenced action against the company before a justice of the peace, the declaration charging trespass in cutting and trimming of trees on his premises, and in the highway adjacent thereto. The record disclosed the fact that the company's employes trimmed some trees so that the wires would not come in contact with the branches and thereby become grounded and broken. This was done in a reasonable manner, no more cutting or trimming being done than was necessary.

In the court below it was held as a conclusion of law that while the company might place poles in the highway without proceedings for condemnation, it had no right to cut, injure or mutilate trees without compensation to the owner for any special damage occasioned thereby. It was this ruling which sustained Wyant's main contention that the Supreme Court was called upon to review.

In disposing of the case the higher court says that the right being given to erect poles and wires, the company must of necessity have the right to remove obstructions. The court takes judicial notice of the fact that the poles must be set near the sides of the street or road, and that they are generally outside of the curb or ditch line, and, therefore, necessarily in line with the trees. Unless they are to be so high as to clear all of them the wires must necessarily go through the trees.

It was also claimed that the telephone company had no right to cut the branches without first giving the land-owner an opportunity to do so himself. but the court says that the present case does not come within the statute relied upon for the reason that this statute refers only to the cutting down or removal of shrubs and trees and not to the trimming of trees.

The New Telephone Company of Indianapolis, Ind., has filed with the county recorder an \$800,000 mortgage on its property, franchises and privileges, canceling the \$500,000 mortgage made at the time the company began operations. The additional \$300,000 will be used in making improvements. President Nordyke is reported as saying that an extension of the plant had become necessary. Instead of preparing for 2,500 'phones arrangements for installing 4,000 instruments will be made.

The Springfield, Mass., board of aldermen has voted to give the Hampden Automatic Telephone Company an opportunity to compete with the existing local telephone company. The only object in granting the privilege is to force the established company to give more liberal rates for the use of its telephones, says the Hartford "Times."

### TELEPHONE INCORPORATIONS.

The Tri-County Telephone Company, Tamaroa, Ill. Capital stock, \$2,500. Incorporators: G. Blanchard, J. D. Morris, A. J. Fitzgerrell, all of Tamaroa.

The Germantown Independent Telephone Company, Germantown, O. Capital stock, \$25,000. Incorporators: John C. Schaeffer, Arthur T. Glew, Harrison Walpers, Henry Kemp and Charles W. Hildabolt.

# NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 161@161c.; Lake, 161@17c.; casting, 16@161c.

The Edison Electric Company, of Cincinnati, has declared a quarterly dividend of 11 per cent., payable April 12.

The Boston Electric Light Company has declared a regular quarterly dividend of \$2, payable April 14. Books close March 31 and reopen April 16.

Stockholders of the Bell Telephone Company, of Philadelphia, ha the proposition to increase the capital stock from \$4,000,000 to \$6,000,000.

The Capital Traction Company of Washington has declared a quarterly dividend of 1 per cent., thereby raising the rate from 3 to 4 per cent. per annum.

The Metropolitan Street Railway Company has declared its regular quarterly dividend of lipper cent., payable April 16. Books close March 29 and reopen April 17.

For the first twenty days of March the traffic on the Metropolitan West Side "L" Railway of Chicago showed a gain of about 23 per cent. over the same period of last year.

The Hartford Electric Light Company has offered \$10 a share for the stock of the old Light and Power Company, the par value of whose stock is \$25, conditioned on getting all the stock.

The directors of the Eric Telegraph and Telephone Company have declared dividend No. 66, 1; per cent., psyable April 9, to stock of record March 31. Books close March 31, and reopen April 9.

The directors of the Commonwealth Electric Company of Chicago have authorized an additional issue of \$500,000 of bonds, of which \$150,000 will be put out immediately. The proceeds will be issued for extensions.

The annual report of the Massachussetts (443 and Electric Light Commissioners for the year 1899 shows gross earnings, \$6,334,414; net, \$2,661,648; balance after charges, \$1,956,125, and surplus after dividends, \$467,896.

The shareholders of the Montreal Street Railway Company have authorized the issue of \$1,000,000 new stock to reimburse the company for amounts already expended, and providing for further extensions of the company's lines, power-plant, rolling stock, etc.

The latest quotations for some of the new industrial stocks, not given elsewhere, are: Electric Boat, 2)(22; New York Electric Vehicle Transportation, 11(2)11; New Eugland Transportation, 6½(2)7; Telegraph & Telephone Company of America,

New England Transportation, 62@7; Telegraph & Telephone Company of America, 4½@42; Gramophone, 49@5(4).

The New Telephone Company of Indianapolis has filed a mortgage with the county recorder for \$8.00,000 in favor of the Central Trust Company of New York and William F. Churchman. The mcrtgage is to become due in 1920, bearing 5 per cent. interest, payable semi-annually in gold.

A bill has been introduced in the U. S. Senate to incorporate the Columbia Telephone and Telegraph Company with a capital stock of \$75,000, with power to increase to \$2,000,000. Power to consolidate with other companies is given and the consolidated company shall have the rights conferred in this most liberal charter. charter.

Mr. Charles T. Yerkes, in discussing the prospects for a consolidation of the elevated roads in Chicago, is reported as saying: "Most of the larger holders of elevated stocks are in favor of consolidation, but they are not by any means a unit in regard to terms. The matter is not being seriously discussed officially at present. I regard the consolidation, however, as something that will take place in the future."

The renewed speculative boom in copper-mining stocks which seemed likely to develop some weeks ago has measurably disappeared, although prices for securities of that description in the Boston and New York markets hold firm, and there is more or less interest shown in the trading on account of the reports of new deals and combinations which will have a tendency to unite properties and interests that in the past have often exhibited more or less divergency.

The Middlesex and Somerset Traction Company has filed a mor; gage for \$1,500,000 at the county clerk's office in Newark, N. J., to cover 1,500 gold bonds of \$1,000 each, which are to be i-sued by the company. This company is the one formed by the consolidation of the Brunswick Traction Company, the New York and Philadelphia Traction Company and the New Brunswick City Railway Company. The mortgage covers the \$500,000 issue of bonds of the Brunswick Traction Company.

The mortgage is given to the Fidelity Trust Company of Newark.

The mortgage is given to the Fidelity Trust Company of Newark.

Directors of the Electric Vehicle Company have declared the regular quarterly dividend of 2 per cent. on the company's preferred stock, payable April 15. No action in regard to a dividend on the common stock has been taken as the company's charter requires the payment of the full year's dividend on the preferred stock before anything is paid on the common. Friends of the company, however, intimate that the company could readily pay dividends on the common out of last year's surplus earnings, but thought it not advisable to do so, as it was constructing a larger number of new vehicles and desired the surplus cash for that purpose.

At a meeting of the directors of the Third Avenue Railroad Company on the afternoon of March 21, the resignations were accepted of John E. Parsons, William H. Curtis, David C. Audrews, Alexander Hadden, John Byrnes, John H. Waydell, and G. Howland Leavitt. Their successors, elected to form a Metropolitan majority, are Grant B. Schley, Walter S. Johnson, Edward M. Burghard, William C. Whitney, Thomas F. Ryan, John D. Crimmins and H. H. Vreeland. The following old directors are retained: Henry Hart, A. J. Elias, Edward Lauterbach, Samuel S. Riker, Henry Iden, Charles Remsen. The officers are: President, H. H. Vreeland; vice president, Henry Hart; secretary, W. N. Amory; treasurer, John Beaver.

Stockholders of the Electric Storage Battery Company at their annual meeting on the 21st inst. elected the following directors: P. A. B. Widener, W. L. Elkins, Daniel H. Shea, George A. Huhn, I. Regan, Herbert Lloyd, Thomas Dolan, W. W. Gibbs, Grant B. Schley, Isaac L. Rive, George Philler, Rudolph Ellis, Joseph F. Sinnot, George H. Day and Philip T. Dodge. The report of operations for the year 1899, submitted by President Day, shows that great progress has been made by the company. Gross sales of its products were \$2,122,679, compared with but \$1,163,584 in 1898. Neteranings aggregated \$924,523, an increase compared with the preceding year of \$6,000,000 capital stock.

In connection with the recent announcement that directors of the New Eng.

In connection with the recent announcement that directors of the New England Electric Veh cle Transportation Company have recommended a reduction of the capital from \$25,000,000 to \$5,000,000, it may be of interest to note that a reduction in the capital of the Illinois Electric Vehicle Transportation Company is also contemplated. A special Chicago dispatch to the Beston Transcript says: "The board of directors of the Illinois Electric Vehicle Transportation Company has voted to recommend to the the stockholders a reduction in the capital from \$25,000,000 to \$2,500,000. The matter will be acted on at a special meeting of stockholders to be held on April 5, one hour before the annual meeting. Of the \$2,500,000,000 to \$2,000,000. The decrease in the stock will make the par value of the shares \$10, of which 50 per cent. is paid in up to the present time. It is probable that at the annual meeting the stockholders will instruct the board of directors not to call the second installment of \$5 a share in one payment, but to ask for it \$1 a share at a time as needed." time as needed.

# EDITORIAL NOTES.

A Chance for Coal Mine and Solar Engine Owners. All accounts from Europe go to show that certain countries on that continent, notably Ger-

many and Russia, are experiencing a coal famine such as has never before been felt. This condition of affairs, which is becoming a very serious matter to the manufacturers and owners of electric lighting and kindred plants, is said to be due to the impossibility of obtaining a supply from the mines of Great Britain. Referring to this subject Consul General Mason of Berlin in a communication to the State Department says:

"Letters are received at this Consulate from importers of English anthracite and gas coals complaining of the meagre supply and high prices, and asking to be put into communication with American exporters of those grades. If, in addition to the enormous quantity of coal now being consumed in the United States, there remains any considerable surplus for export, and the conditions of freight are not prohibitory, the present season offers a rare and fertile opportunity to establish in the German market the standard grades of American anthracite and gas coals.

"Each succeeding day during the past fortnight has increased the general deficit of fuel, and the situation has become critical and ominous for the manufactures and export trade of Germany. Numerous important glass, porcelain and machine factories in Silesia and Saxony have been obliged to shut down for want of fuel; there are a dozen electric lighting and power plants in this country which have less than a fortnight's coal provision on hand and no source from which to obtain further supplies.

"In Russia the situation is equally urgent and critical. The enormous and rapid development of railways and certain manufactures in that country during the past three years has completely outrun the limited domestic coal supply, so that naphtha fuel, which has been hitherto largely used, has advanced in price from 4 to 19 copecks (2.06 to 9.8 cents), and the Russian Government has sought to ease the pressure by suspending for an indefinite period the usual prohibitory import duty of \$2.80 per per ton on coal."

As is well known England has heretofore

been the country upon which most of the nations on the continent have relied for fuel, for outside of France no European country produces sufficient coal even for its home demand, and now that the mines of Great Britain are failing, the natural inference is that the necessary coal for turning the wheels of manufacture in Germany and elsewhere will have to be obtained from this side of the Atlantic.

Besides furnishing a golden opportunity for our coal exporters, the time would seem ripe for some of the gentlemen who have invented machines for utilizing the heat of the sun, and regarding which so much has appeared of late, to step forward and show what their devices are capable of doing. During the past few years at least half a dozen so-called solar engines have been been brought out, which, if any one of them is capable of accomplishing one-tenth of what has been claimed for it in the way of utilizing the heat of the sun in operating machinery, should make its owner a multi-millionaire if introduced without loss of time into Germany.

#### \* \* \*

A Trolley Automobile. In a recent issue of "L'Industrie Electrique" of Paris, there appears an article from the pen of

Prof. Hospitalier, descriptive of what might be termed an trolley-automobile, the invention of M. Lombard-Gerin. The arrangement, in a word, consists in doing away with the storage battery on the vehicle, and connecting the motor by means of a flexible cable to a self-propelling overhead trolley, which rests on two hard drawn copper wires suspended from twenty to thirty feet above the ground.

In order to demonstrate the practicability of his invention M. Lombard-Gerin has constructed just outside of Paris, and running along the Seine, a test line about half a mile in length. In this experiment the two overhead conductors, which are of No. 0000 wire are placed some twelve inches apart, and it is on these that the trolley runs. This unique arrangement consists of a small non-synchronous induction motor which drives, by means of three-phase currents produced by the motor on the vehicle, aluminum wheels which rest on the trolley wires. By this arrangement the speed of the trolley-which by the way only weights about 40 pounds-is dependent on the speed of the vehicle. Thus, when the carriage is brought to a standstill, current no longer passes to the trolley motor, and as a consequence it stops, and likewise when the speed of the carriage motor is increased a greater amount of current flows to the trolley motor, causing it to move faster.

To allow of vehicles moving in opposite directions passing one another, the inventor has made the flexible cable connections interchangeable, so that all it is necessary for two vehicles to do on meeting is to exchange cables, when they can continue on their respective ways. With this end in view a pole changing switch has been placed in the three-phase circuit of the trolley motor, which permits of the two conductor connections being reversed, and likewise the direction of rotation of the armature.

The flexible cable, which is made up of six conductors, two large and four small, the former leading the current from the trolley to the motor of the carriage, the latter controlling the little non-synchronous induction motor of the trolley, is twenty-five to thirty feet in length, which permits a vehicle turning out for teams without interfering with its operation, or placing undue strain on the trolley wires.

The field of usefulness of such an invention is thought to be in conjunction with trolley or steam roads, where the limited amount of traffic would not warrant the outlay for tracks, but where the trolley-automobile would prove of value to farmers or manufacturers by furnishing them with a cheap and rapid means of transporting their goods or products to a shipping point.

¥

A Setback for Three-Cent Fares.

In the last issue of ELECTRICITY was briefly mentioned the fact, in the Legal Notes, that the Citizens' Street

Railway Company of Detroit, Mich., had defeated the city authorities in their attempt to secure a reduction of fares on the lines of the company from five cents, which the city charter permitted the company to charge, to three cents.

We have just received the voluminous decision, which Judge Swan of the United States District Court handed down, and it is very evident that the agitation led by Governor Pingree for three-cent fares has gone "the way of all bad agitations."

When Governor Pingree and his followers in Detroit sprung the scheme for the reduction of fares upon the Citizens' Street, Railway Company the company refused to accede to the demand on the ground, first, that it could not afford to do so, and second, that it did not have to do so. The Detroit Common Council replied that the charter provision authorized it to override this refusal. The railway company maintained its rights, disregarded the ordinance of the Council, and appealed to the courts for a perpetual injunction against its enforcement. It held that the ordinance was a violation of contract, and also an attempt to deprive it of a reasonable income on its investment. The city contended that the charter not only granted the right to make the reduction, but that the reduction was a proper exercise of the police power. Judge Swan, in his decision, emphatically sustains the company in its contention. He holds that the reduction is not a proper exercise of the police power, and if it was, it could not be exercised to deprive the company of vested interests without compensation. He holds, moreover, that even the

State Legislature could not exercise the power that the Common Council had arrogated to itself. A sequestration of any part of the company's earnings would be confiscation.

Of course the city authorities and all good Pingreeites are dissatisfied with this decision of the United States Circuit Court, and are agitating for an appeal to the United States Supreme Court, but here again they are confronted with a famous decision that ought to have a good effect on reasonable minds. In the Nebraska freight case decision the State Legislature had passed an act to reduce freight. rates below a point that the railroads thought profitable. In sustaining their position, Justice Harlan of the United States Supreme Court, who read the opinion, held that a railroad corporation is a person within the meaning of the fourteenth amendment, declaring that no State shall deprive any person of property without due process of law, nor deny any person within its jurisdiction the equal protection of the laws. "A State enactment or regulation," he added, stating the principle controlling his decision, a principle which he said must be regarded as settled, "made under the authority of a State enactment, establishing such rates for the transportation of persons or property by railroads as will not admit of the carrier earning such compensation as under all the circumstances is just to it and to the public, would deprive such carrier of its property without due process of law, and deny it the equal protection of the laws, and would, therefore, be repugnant to the fourteenth amendment of the constitution of the United States."

It will be an easy matter for the Citizens' Street Railway Company to show that the proposed reduction of its fare would not permit it to earn "such compensation as, under all the circumstances, is just to it," and if the wise city fathers of Detroit are really anxious to protect the interests of the taxpayers of the city they will let the matter drop, as it is morally certain that the decision of the Supreme Court would be against them.

## UNDER THE SEARCHLIGHT.

# Notes and Comments on Various Topics.

It now looks as though Newark, N. J., would have an Industrial Exposition in 1902. This will be the first exposition of the kind in that locality since the one held in 1872, and will it is thought serve to bring the products and business standing of that city prominently before the whole world.

It is stated that the Manhattan Elevated Railroad Company is to build an extension from its present terminus at 177th street and Third avenue in this city to Fordham, a distance of a mile and a half.

The first electric street railway car ever operated in Santiago, Chili, went successfully over the line on Sunday last. A great deal of interest was taken in the event by the inhabitants.

The Baltimore and Ohio Railroad will establish an electric automobile service in connection with its trains at Washington, D. C. The automobiles are made especially for that service and are so built that two small trunks can be carried on the supports at the rear of the vehicle and the top of the cab provides

ample room for small traveling bags and hand luggage. The cabs are lighted by electricity and in each is a clock and a dial showing the distance traveled, the time the cab is in use, and the amount of fare the passenger should pay.

A St. Louis dispatch says that Vice-President and General Manager E. P. Bryan of the St. Louis Terminal Association has tendered his resignation to accept the position of general manager of the New York Rapid Transit Subway Company under a contract for a term of five years at a salary of \$20,000 per annum.

The successful application of ozone for bleaching yarns has been made recently in Silesia, and an electrical plant for the work has been established. Bleaching by ozone is a natural system, and one that has been sought for some time, but not sufficient ozone could be obtained to make the experiment successful. If the new plant proves all that is claimed for it the adoption of the same process of bleaching wool, silk and cotton will follow in this country. Ozone bleaching is considered far superior to sulphur bleaching, as the white produced would be permanent and would not disappear when the material was washed. The sulphur bleaching also tends to injure the fabric, while the ozone has no such effect on cotton, silk or wool. The new process consists in forcing air by electricity through a series of driers to free it from moisture and then through an ozonizer chamber.

It is announced that passenger boats propelled exclusively by electricity will make their appearance on the Seine River, early this spring, in connection with the Paris Exposition. These boats will be charged by an electric machine on the river bank at Asnieres, in front of their mooring station. They will run at a rapid speed, without noise or smoke, and will be able to make 63 miles without its being necessary to recharge the batteries.

A GREAT improvement has lately been made by placing a motor engine and an electric capstan at the drawbridge over Wallabout Creek, on Washington avenue in Brooklyn, which will be of material benefit to Wallabout Market men and others having business at the market. The channel heretofore has been frequently blocked by canal boats, which have been unable to get through without considerable tugging at ropes on the part of the owners and crew. The bridge has accordingly been kept open for an hour or more at a time. By means of the new motor and capstan a rope may now be attached to the boat and it can be hauled through in a short time.

At Tomahawk, Wis., electricity from water power is now being used to run the machinery of the new Marinette, Tomahawk and Western Railway Company's elevator. About forty carloads of oats, wheat and corn, it is claimed, are being unloaded daily into the elevator.

Three telegraph machines have been installed in the Pennsylvania Railroad telegraph operator's room in the Union Station at Harrisburg, Pa. They are new quadruplex machines of the very latest design for sending four messages over one wire at the same time. They were put in operation for the first trial on Monday and are working in a very satisfactory manner. Two wires are worked to Philadelphia, one to Altoona and one to Pittsburg. The

machines are operated by seven new dynomotors, which have been installed in the cellar of the Union Station and have displaced the old jar batteries.

The Hatch Electric Smelter Company of Milwaukee, Wis., has about completed its large demonstrating plant and it is expected that stockholders from all over the country will be in attendance at the formal test in a few weeks. The company will treat iron ores principally.

A BILL of complaint has been filed in the United States Circuit Court by the Societé Anonyme Pour la Transmission de la Force par l'Electricite of Paris, France, against the Hartford (Conn.) Electric Light Company for alleged infringement of an alternating current electrodynamic machine and of a method of operating the same on which letters patent No. 529,272 were issued by the United States Patent Office October 16, 1894, and were assigned by the inventors, Maurice Hutin and Maurice LeBlanc, to the complainant. The complainant prays for an injunction against, the use, sale or manufacture of such instruments, and asks for an accounting, and that the defendant be required to pay over all profits resulting from the use and sale of such instrument.

The Sao Paulo Light & Power Company of Brazil has recently contracted for the following material in the United States: 50,000 feet of weatherproof cable, 6,000 Brookfield insulators and 7,000 other insulators. Contracts for these goods, together with others which have been awarded to United States firms, show an aggregate value of over \$100,000.

It is understood that the large cars on the Third Avenue Railroad Company's lines will be done away with under the new management in the near future. The cars are said to be the largest in use on any street railway in the United States. They are 41 feet in length over all, and the body of the car is 32 feet long. The windows are so arranged that they can be dropped down entirely out of sight, converting the car into an open one for summer use. The reason given for doing away with this type of car is that the cross seats take up too much room, thus excluding passengers.

The double turrets of the new battleship Kearsarge, which are operated by electricity, have recently been subjected to a severe test and have proven satisfactory. In a telegram to the Navy Department Capt. William N. Folger said: "The double turret was thoroughly tested, and is an assured success, both from military and structural standpoints. There was no interference between the planes of guns or inconvenience from blasts or smoke. The structure, tested with simultaneous discharge of three guns, is amply strong to withstand the united shock of the four guns of either turret."

An English daily is responsible for the statement that during the first few weeks of the Paris Exposition visitors will not be able to use the new electric railway owing to the delay in completing the same. The trials were originally fixed to take place at the beginning of April, but the date now given is May 15. The railway will, however, be a great relief to the traffic when it does begin running, as it is to be a very commodious line. The carriages are

to be of the corridor pattern, carrying some fifty passengers, and will each be lit by ten electric lamps. Separate doors for the entrance and egress of passengers are to be provided, thus avoiding confusion and crush on the platforms. The trains are to run at very frequent intervals, and the run of nine miles from Vincennes to the Bois de Boulogne is to be accomplished in twenty-seven minutes, including stoppages. The question of the ventilation of the tunnels has now arisen, and it is stated that, in default of shafts, it will be absolutely necessary for the public safety to place pumps worked by electricity on the line between the stations to ventilate the tunnels.

The Brooklyn Rapid Transit Company should have little difficulty in handling travel this summer. It is now receiving some of the 300 new open cars ordered some time ago, and expects to have them all ready with the return of warm weather. The company has added 500 new open cars to its equipment in two years, including the 300 now in course of delivery.

Hamilton King, Consul General to Bangkok, in a communication to the Department of State, says of the industrial development of Siam: "Rice cultivation is the principal industry of Siam. There are twenty-six steam rice mills in Bangkok, and although the first one in the country was started by an American, none are owned by Americans to-day. Four are European, and the rest are owned or managed by Chinese. Some of these Chinese firms have a very large capital. Seven of the mills have their own electric light plants, one of which was furnished by an American house.

UNDER the title of "A Bachelor of Science?" the London "Electrician" publishes an item which states that in an account of Mr. Marconi's recent experiments before the King of the Belgians, "L'Etoile Belge" refers to Major Flood Page, chairman of the Wireless Telegraph and Signal Company, as "President de la Société Wiveless,"

The following are the customs dues for electrical material imported into the Argentine Republic during the current year: Machinery, in general, 10 per cent ad valorem; iron or steel galvanized wire, up to No. 14, 10 per cent; wire or cables, over 5 millimeters in diameter, for electrical purposes and the necessary articles for laying submarine cables, 10 per cent: plants for public electric-lighting stations, 10 per cent: automobiles, 10 per cent. Rails, tie-bars, wedges, chairs, and all material necessary for electric traction purposes, are admitted duty free.

GEORGE C. HALE, who has for nineteen years been chief fire marshal in Kansas City, recently conducted a successful test of his invention -an automatic fire alarm which was witnessed by several interested in the device. In discussing his invention Mr. Hale said: "My automatic fire-alarm system supplies the missing link in the fire service of to-day. It sounds an immediate alarm. At intervals on the ceilings of the different floors of a building pro tected by this system are thermostats. As soon as the room attains a certain temperature these thermostats-being connected with a phonograph in the office by a system of wires -cause recorded sentences on the phonograph cylinder to be ground out over the telephone. The public telephone can be used, my invention being so perfected that the phonograph automatically switches itself over in front of the transmitter. The Central Telephone Company can then give the alarm to the fire department. The automatic fire-alarm system takes the place of the watchman. It never sleeps, and the phonograph will continue to repeat the location of the fire until it is shut off."

An automatic bicycle pump has recently been brought out operated by means of an electric motor. On dropping a nickel into a slot an electric circuit is completed which sets in motion the motor and pump.

NEWARK, N. J., is beginning to experience the same trouble with its water mains that other cities have in which the overhead trolley is to be found. A section of pipe recently tested was at a positive potential to the trolley rails, proving conclusively that electrolytic action was going on.

THE Chicago Electric Traction Company, the only storage battery line in Chicago, will go back to the overhead trolley system in the next few weeks. Eastern owners of the company's stock decided on this change at a meeting in New York recently, and the change will be made as fast as the trolley system can be installed. This marks the conclusion of a costly experiment in the Windy City to demonstrate the value of accumulators in traction work.

The electric exhibit at the Paris Exposition bids fair to be one of the most attractive parts of the show. There will be a complete retrospective exhibit of electrical and mechanical apparatus of historical character, and the special exhibit will be housed in the "Court of Honor."

THE San Francisco (Cal.) "Chronicle" apparently has little faith in compressed air as a motive power, for in a recent issue it says: "Compressed air as a power agent is not free from danger. Two accidents have occurred from its use on the Metropolitan Street Railway in New York through the bursting of the reservoir or bottle containing it attached to the cars. The later one, which happened a few days ago, demolished the car, seriously injured three men and slightly injured a dozen others. It is evident that compressed air reservoirs will have to be supplied with safety valves similar to those used on steam boilers to secure them against explosions, or the risk of life and limb will be too great to warrant the employment of this agent for passenger traction purposes."

Mr. C. H. Cahan, of Halifax, N. S., has just returned from British Guiana and Trinidad where he has been for some time in the interests of a Montreal and Halifax syndicate, incorporated as the Demerara Electric Company. Sir Willam Van Horne is president, Hon. Senator Drummond, vice-president, and B. F. Pearson, of Halifax, secretary. The company has obtained in the colony of British Guiana exclusive electric lighting, power and tramway franchises for the city of Georgetown and its environments within a radius of five miles. The company has purchased all existing electric light plants and mule tramways in the city, and is now completing the installation of electric traction on the tramway, which will be fully accomplished by July 31 next. The capital of the Demerara Company is made up of tonds for \$400,000 and \$850,000 of capital stock.

#### FREDONIA POWER HOUSE FIRE.

#### BY FRANK C. PERKINS.

The recent fire at Fredonia, N. Y., not only destroyed a large portion of the town but practically wiped out the entire plant of the Dunkirk and Fredonia Street Railway Company. Mr. M. M. Fenner of Fredonia, N. Y.,

supplying the place with electric lights, small motive power and heating many of the larger buildings by exhaust steam. The Fredonia Normal School, the postoffice and several churches were without heat and light during a day or so of severe cold weather. The characteristic qualities of all electric companies which have been burned out at once showed

FIG. 1.—GENERAL VIEW OF FREDONIA STREET RAILWAY POWER HOUSE FIRE.

is general manager and Mr. Frank May of Dunkirk, N. Y., president. The car barns, motor cars and power house were entirely destroyed. The buildings, cars and power equipment were absolutely without insurance.

The accompanying illustrations, Figs. 1 and

themselves, and within a short time the plant was furnishing heat, light and power. The trolley line was also soon in operation, a temporary plant furnishing the necessary current until the permanent power plant is constructed.

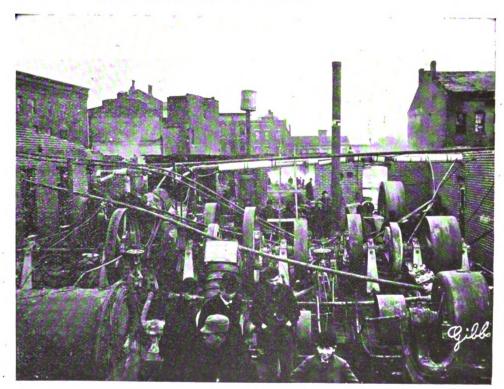

FIG. 2.—INTERIOR VIEW OF FREDONIA STREET RAILWAY POWER HOUSE FIRE.

2, give a good idea of the wreck as it appeared the day after the fire. The company was at the time operating the only electric road between Dunkirk and Fredonia and was also This power plant was one of the few installations where the five wire system was tested for local lighting and power work, utilizing the surplus power from the street railway plant. Several Edison bipolar generators were coupled together on the same base, the armature shafts all being direct connected. The five wire system of distribution was employed, giving 100 volts for ordinary incandescent lighting, between any two wires; 200 volts or 500 volts being utilized for motors. This system was introduced in Paris on a large scale and was fully illustrated and described in Electricity in Vol. II, No. 9, page 102. The Dunkirk and Fredonia Street Railway Company operate over four miles of track and had about a dozen motor cars in service.

# THE DAMPING OF GALVANOMETER NEEDLES.

[From our London Correspondent]

Before the Physical Society on March 9 Mr. M. Solomon read a paper on "The Damping of Galvanometer Needles," He said that the solution of the equation of motion for a magnetic needle, swinging in a uniform magnetic field, pointed to the conclusion that the ratio of the period to the logarithmic decrement is independent of either the moment of the needle, or the strength of the controlling field, and is simply a function of the damping coefficient and the moment of inertia of the moving system. This ratio should, therefore, be constant if these latter quantities are constant. Experiments to test the constancy of period to logarithmic decrement have been conducted at the Central Technical College at various times since 1891, and they have invariably pointed to a variation in the value of the ratio. The object of the present paper is to discover the cause of this variation. It may be due to an alteration in the moment of inertia, or to an alteration in the damping coefficient. If the control magnets are either directly above or directly below the needle there is no chance of any change in the moment of inertia. The damping coefficient depends on three things: (1) viscosity of the air, (2) viscosity of the suspension, and (3) eddy currents. The author has carried out experiments with a galvanometer on open circuit, and finds a constant value for the ratio. The viscosity of the air and suspension, therefore, cause no variation. Upon closing the circuit, and repeating the experiments, the value of period over logarithmic decrements alters. The variation is, therefore, due to eddy currents. The damping factor due to eddy currents may vary owing to three causes: (1) change in moment of needle due to change in field strength; (2) effects of self-induction; (3) effects of rise of temperature on the resistance of the coils. The author points out that the two latter causes would tend to alter the ratio in the wrong direction. and he therefore concludes that the variation is due to an alteration in the strength of the swinging needle produced by altering the strength of the controlling field.

A brief discussion followed, after which Mr. G. W. Walker contributed a paper on "The Distribution of Gas in an Electric Field." He considered a gas as consisting of a number of molecules each containing two atoms of equal mass, one positively and the other negatively charged with electricity. When under the action of electrical forces some of the molecules split up and we arrive eventually at a steady state in which there is a definite number of undissociated molecules and of free positive and free negative atoms. Treating the problem as one-dimensional, the potential at any point is expressed in general by elliptic func-

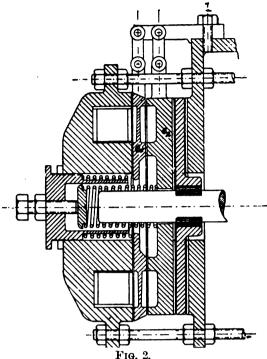

tions, and is therefore periodic. Applying the results to the case of a vacuum tube it is found that there is superimposed upon the gradual fall of potential along the tube minor periodic variations which, it is suggested, are connected with the striæ of discharge. Both the matter density and the electric density are periodic along the tube. If the places of maximum matter density coincide with the places of minimum electrical action, then whether luminosity is due to collisions or recombinations there will be maximum luminosity at these points. In general these points do not coincide, and thus the positions of maximum luminosity are not clearly defined. The analysis leads to the conclusion that the distance between the striæ is inversely proportional to the density of the gas and to the current strength, and these facts have been experimentally veri-

### AN AUTOMATIC BRAKE.\*

In many classes of machinery driven by electric motors, the necessity for some form of automatic brake has made itself felt. In the case of cranes and hoists it is required to retain the load when the motor is stopped, and in other cases for the purpose of stopping quickly and with precision.

What is required is a brake which is normally held on by a spring or weight, and which is released by an electromagnet, the exciting current of which is preferably controlled by a switch attached to the switch which starts and stops the motor. Thus, when the switch turns current on to the motor it simultaneously turns current on to the electromagnet, so releasing the brake, and when it is turned off it simul-

the fixed plate tightly together, so that the motor shaft cannot turn. An electromagnet is provided which, when energized, pulls the pressure plate back and releases the disk. In Fig. 1 an illustration is given of one of the

brakes fitted to a motor for driving a set of plate-bending rolls, the object being to get quick stops instead of having to wait for the momentum of the motor and gearing to die down. The users have found this a great advantage, as they are now able to get more work out of their rolls than they could before the brake was adopted.

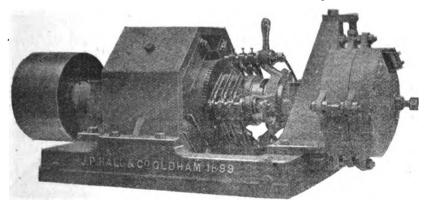

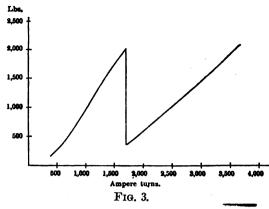

Fig. 1.

taneously interrupts the current to the motor and to the brake, so that the brake renews its grip.

An arrangement which has been used to a certain extent consists of an ordinary band brake with an electromagnet to lift the lever. This arrangement requires very careful adjustment owing to the short range through which an electromagnet acts. For the same reason any slight wear of the band or pins will cause the brake to slip, so rendering it unreliable.

The brake which we illustrate has been devised to get over this difficulty. It is constructed somewhat on the principle of a Weston friction clutch. A disk slides on a feather key on the motor shaft, and is placed between two plates, one of which is fixed to the frame of the machine, and the other swings on a link and is provided with stops to prevent rotation. This movable pressure plate is acted upon by a spring, which presses it, the disk and

Generally a simple on and off brake is all that is needed, but in some cases, and more especially in cranes, it is desirable that the brake should exert an intermediate pressure between full on and full off. The sectional drawing, Fig. 2, shows a brake arranged to give two pressures. There are two pressure plates, e1 and e2, and there are two springs, one pressing on each plate. The magnet switch in this case requires three points: "off," "on" through a resistance, and "on" to the magnet direct. The tractive force curve for one of these brakes is given in Fig. 3. This brake is intended to exert a total pressure of 4,000 lbs. with an intermediate pressure of 1,650 lbs. The plates, •1 and e2, each exert a pressure of 2,000 lbs. Referring to the curve it will be seen that as the ampere-turns round the magnet increase, its attraction increases, till at 2,000 lbs. the plate e, is pulled over, leaving the plate e, still pressing on the disk. At this point the attraction (which is now exerted between  $e_1$  and  $e_2$ ) falls to 375 lbs. owing to the magnetic short circuit formed by  $e_1$ . As the ampere-turns are further increased the thin part of  $e_1$  becomes saturated, and the magnetic potential across it rises, causing the attraction to increase till at 2,000 lbs. the plate  $e_2$  is also

pulled over, leaving the disk free. The effect obtained by this arrangement is the same as though two simple brakes were used exerting pressures of 2,000 lbs. and 1,650 lbs. respectively. It is, however, much simpler, the only addition to the simple form being the extra plate and the division of the spring into two parts.

# COPPER FROM THE ORE TO THE WIRE BAR.\*

#### BY ALBERT R. LEDOUX, M.S., PH.D.

Electrical engineers are familiar with copper in its finished form, but not all of them know where it comes from nor what are the various steps through which it passes before it gets in their hands. The production of copper on a commercial scale in the United States dates from 1845, although temporary mining of ores and smelting had been tried at intervals for one hundred years previous to that date. The production of copper in America from 1845 up to 1890 amounted in round numbers to 1,000,000 tons. Prior to 1880 Lake Superior produced nearly the whole quantity, but from 1880 to 1890 Montana and Arizona began to compete with the Lake region, and the figures for that decade are:

Lake Superior	45	per cent
Montana	36	. "
Arizona	15	"
Elsewhere:	4	66

In 1890 Montana passed its rival, the figures for that year being:

The following table shows the increase in production in the last five years. It is stated in pounds and in round numbers:

1890.	1897.
143,000,000	145,000,000
232,000,000	287,000,000
72,000,000	81,000,000
1898.	1899.
158,000,000	155,000,000
216,000,000	289,000,000
111,000,000	122,000,000
	143,000,000 252,000,000 72,000,000 1898, 158,000,000 216,000,000

In 1899 the production of the world increased 50,000 tons and the consumption nearly as much.

Copper is more easily discovered than gold because its compounds are conspicuous and its ores are blue, green or yellow, as a rule. Gold is seldom visible to the naked eye excepting in "specimen mines," which are usually not large producers.

There are three types of copper ore-metallic,

<sup>\*</sup>Synopsis of a lecture delivered before the New York Electrical Society March 2, 1900.

<sup>\*</sup> From the "Electrical Review," London.

sulphides and oxides. All three types are frequently found in the same mine or district, but, broadly speaking, the metallic mines are confined to Lake Superior. The sulphide ores have received their greatest development in Montana, and the oxide ores are characteristic of Arizona. There are many other districts producing copper, such as the veins and lenses which constitute beds in North Carolina, Tennessee, Vermont and elsewhere on the Atlantic coast. In fact, the first mining on a large scale was at the Ely mine in Vermont. At the Union copper mine, in North Carolina, veins which were operated for gold in the beginning of this century are now being reopened for copper, and a very large expenditure has been made upon the surface as well as underground to make this old property a remunerative producer.

#### METALLIC DEPOSITS.

The Lake Superior ores carry the copper in an almost chemically pure form. The metal is disseminated through lavas, sandstones and conglomerates, sometimes in masses, but usually in tiny specks, the average assay of the district being less than 4 per cent. of copper, but the distribution is so uniform and the average so sure that the Great Lake mines are among the most reliable from the point of view of the investor. The Calumet-Hecla has paid its shareholders over \$66,000,000 since 1871, and has produced nearly 1,500,000,000 pounds of copper. The ore is raised from twelve shafts, one of them over four-fifths of a mile in vertical depth, and the life of the mine is assured for many years by the ore blocked out. From this mine 5,000 tons are hoisted daily an average distance of 3,000 feet. The cost of Calumet copper laid down in New York in the form of wire bars or ingots probably does not exceed 6 cents per pound.

The Tamarack is another lake mine with a history. Its deepest shaft is 4,600 feet, and will soon reach a mile in vertical distance from the surface.

The Lake Superior ore admits of simple treatment. It is pulverized in steam stamps each handling hundreds of tons in a day When pulverized and automatically screened and separated into several grades of fineness it passes to jigs and concentrating tables or bundles. A jig is practically a sieve plunged up and down in water. The lecturer illustrated this by supposing a flour sieve to contain a mixture of white sand and shot of substantially the same size, If the sieve was forced up and down in water the ascending current would finally bring all the lighter sand to the surface leaving the heavier shot on the bottom. If the mixture flowed into the sieve continuously the light sand would overflow the side of the sieve with the water and by and by the shot would all be collected on the bottom. whence it could be continuously or intermittently removed. The finest ore in size goes to tables over which a stream of water flows-the lighter and worthless gangue being washed away while the heavier metal remaining upon the table is caught or diverted into another direction. While the ore of the Calumet prob-. ably averages 4 per cent. copper, there are other paying mines that have phenomenal records of economic working. Among these is the Atlantic. In 1898 it produced 4,500,000 pounds of copper, yielding the company 11.83 cents per pound. The average of the ore was about six-tenths of 1 per cent., or a value of \$1.40 per ton of ore raised: mining cost 90 cents, transportation 5 cents and milling 24 cents;

the total operating expenses, including freight and commissions, were \$1.3481 per ton. The copper, therefore, cost 9 cents a pound—giving a net profit of nearly 3 cents. This record is not equalled in any other copper mine.

The so-called mountain system of veins is characteristic of the Rocky Mountains and Sierra Nevadas, and, as stated, they receive their greatest development in the vicinity of Butte, Mont., as far as sulphide ores are concerned. The Butte mines are complex. There is no "bed" corresponding to the Calumet conglomerates, but sulphides are interspersed in bunches or otherwise through altered gran-The Butte district is seven miles by four in extent, but the mines that have made Butte famous underlie an area of about 3,000 by 7,000 feet. Many of the Butte mines, were started as silver propositions, the altered surface ores being rich in that metal. As depth increased rich ores grew more scarce, but at the depth of to-day, from 1,500 to 2,000 feet, the grade is quite uniform—in the neighborhood of 6 per cent, copper is the average of the camp. In their early days the Butte mines used to ship ore to sampling works in New York, which contained over 50 per cent copper. All the Butte ores contain gold and silver as well as copper. The Anaconda has produced over 1,000,000,000 pounds of copper, 50,000,000 ounces of silver and 150,000 ounces of gold. This copper mine is the largest silver producer in the world. From 3,000 to 6,000 tons of ore are mined daily from the Anaconda. The caverns produced from this extraction of ore can be readily computed. A volume equal to the building space on any one of our city blocks is excavated every month under Butte. The Anaconda supports the surface by the introduction of a forest of 60,000,000 feet of lumber yearly. The ore is carried 27 miles to the metallurgical works which reduce it. The difference in the treatment as compared with Lake Superior is due to the fact that in the first case we have only metallic copper to separate, refine and remelt into wire bars or ingots, while the sulphide ores contain a larger proportion of impurities than lake copper—the principal impurities being sulphur and iron, although arsenic, antimony, bismuth and other undesirable substances, including tellurium, are usually The metallurgy of the Butte copper present. ore consists of several stages. First, the concentration to separate the sulphides from the granite or other gangue; second, roasting to get rid of the greater part of the sulphur with its accompanying volatile impurities; third, the smelting of the roasted sulphides to form what is called a "matte:" fourth, the so-called bessemerizing of the matte to produce impure copper, and finally the refining of this impure copper. The ore arriving at the Anaconda works is discharged from the cars at the highest point, the works being situated on a side hill; it passes through crushers which break it up small enough to go into the steam stamp mills, from which being automatically senarated into various grades of fineness or size it passes to jigs similar to those employed in Lake Superior, which separate the ore from the gangue and deliver the concentrated ore at the roasting furnaces. Some of the very fine ore is treated separately on tables, the details of which it is not necessary to describe. The ore is roasted in several mechanical roasting furnaces of different make and principle. In the early days of copper smelting the sulphides were usually roasted in heaps on the ground and sometimes in so-called stalls, but

in the most modern plants the roasting is performed in mechanical furnaces.
